MR. PRESIDENT AND GENTLEMEN : It is with unmixed pleasure and delight that I accept the kind invitation of your Committee to bear my part in this public congratulation, in this general and hearty homage of our countrymen to the genius, the felicity, and the fame of your distinguished guest, I am sure he will permit me to feel, though I have no right here to express, that I claim some right of affection, to feel a near and even a personal interest in his illustrious distinction and in the great benefit he has conferred on the world, because I may be permitted to think, in pursuance of the sentiments with which he so nobly closed his address to you, that the devout sense of duty to God and the generous sentiments of affection to man, which guided the counsels of his home and mine, had something to do with his devotion to the good of his kind. And were I disposed even to forget, as how should I, this little personal interest, I never turn my eyes to the wall in my parlor that I do not attribute to your accomplished pencil the only preservation of the features of my father and your friend. [Applause.] The founders of States, and the pilots that guide their destiny through every danger, the great teachers of morality, the warriors that by land and sea save and protect what is thus founded, the authors and the artists that beautify and enlighten the civilization thus preserved, the great lights of jurisprudence that maintain justice for the general and common right over all, and the inventors that carry this whole movement forward and add ever new and greater powers and faculties to man, and make his reason effectively dominant over nature—these are the muster roll of the heroes of our race, these the men whose memories we will not suffer to die. [Applause.]

It seems really as if the course of Providence with man was that he should only feel a need or have a desire awakened, in order that he might reach out and take the good gift that is ready for his reception. For of nature, as of grace, this seems to be the law, that he that asks shall receive, and to him that knocks it shall be opened. Man begins, it would seem, by repining at his own weakness, and envying the superior powers of the brutes. He longs for the wings of the eagle, that he may cleave the air ; for the respiration of the fish, that he may swim the seas. He wonders at the strength of the leviathan, and the swiftness and endurance of the horse, that can help him over space where human feet stumble ; at the roar of the lion, and his mighty paw that makes him formidable in fight. And then imagination outlives these natural examples, and affirms the powers and faculties of demigods and heroes ; and man sighs again that he is denied this greatness. The bow of Apollo that from the summit of Mount Ida can transfix the foe upon the plains of Troy ; the winged heel of Mercury that can carry messages in brief time over large space ; the prowess of Proteus that can triumph over fire-breathing dragons ; the strength of Hercules ; the hundred eyes of Argus that can inspect on all sides what is going on in the world ; and the hundred arms of Briarion that can have a finger in every pie—these racked our envy and our aspiration, but then comes this crowned procession of inventors, that teach us that a good God, in giving man reason, has given him all these powers, scattered in the natural creation or imagined by himself ; and that, in his practical inventive reason, he includes and transcends them all. [Applause.] Who now dreams of comparing the actual powers of man, in their every-day exercise, with all that nature has displayed besides, all that imagination has contrived ?

But, sir, it must be said of your invention, crowning thus far, but not, we hope, ending the long line of benefits, that it adds more distinctly, more nobly, more truly to the intellectual power of man than any other form of invention. [Applause.] Everywhere throughout this vast country, connecting all associated nations too in the circle, we see and know at once what is going on, we send our means and faculties of acquiring knowledge, and filling ourselves by ransacking all the events of the world. We send forward our will, and make it known and felt and executed at the farthest limit of civilization. And whether we take your general invention, or that signal instance of its service, which another eminent countryman of ours now here present has shown to the world,

which he has produced through his commercial activity and his strenuous intelligence to force this wonder upon us all, that the wide ocean which still divides no longer separates the continents. [Applause.]

But, Mr. Chairman, every new faculty, every enlarged power, every wider opportunity brings to man new and firmer and greater duties. What I have spoken of has added to the powers of man, but has not added to his individual or to his social faculties and needs. Neither you nor Mr. Field can cross the Atlantic with your intelligence, of yourselves. All that the steam engine, all that the arts of war, all that the triumphs of invention have accomplished, has not added to the relations of the individual man, but has simply multiplied, strengthened, expanded, ennobled, secured high-minded civilization. Let civilization cease ; let laws, affections, morals, lose their sway, and all these new powers of man drop lifeless and useless, their memory only a disgrace to his lack of morality. And this great trust is in the service of truth, and is a bond of society, and cursed be he who perverts it to power or to vice. May we not say to such men, in all reverence, as was said in a fatal instance of punishment : "Thou has not lied to man, but to God." Hence the management demands, and the social instincts that preserve all their vital interests require, that truth should preside at every magnet, and that no malice, no cupidity, should dare to invade the inviolable sanctity, the impregnable immunity of the telegraph. [Applause.] If civilized society, by such homage as this, shows that it knows who the friends of civilization are, let it, by its burning tones against these marauders, show what its sense of the enemies of civilization and of society are.

Now, who shall manage the material and commercial interests of the telegraph, but the people in society for whom it was framed, and letting Government, in its general administration of law, control and guide that, as it does all the other private interests of the people ? [Applause.]

And now, Mr. President, I am sure that our distinguished guest, in so beneficent and wide spread benefit as he has conferred, has never found anything yet returning from it to plague the inventor. [Laughter.] I am sure so intelligent and experienced an observer of human affairs will not count as a plague those lawsuits through which he was carried. [Laughter.] Why should it not be understood that there is no greater honor in a free country that can befall a man than to be a party to a lawsuit. [Laughter.] The learned chairman will inform you that jurisprudence and judicature take no notice of controversies or of principles, unless they are presented by actual cases. The practicing lawyer will tell you that there never can be a case without clients on one side or the other. And really every one who in important litigation assists the glad life of jurisprudence disposing itself over the people to their joy and happiness, should regard himself with the same self-complacency and satisfaction, as if he were chosen to Congress or invited to a dinner like this. [Laughter and applause.]

The seventh toast was :

"The Telegraphic Wire, the nerve of international life, transmitting the knowledge of events, removing causes of misunderstanding, and promoting peace and harmony throughout the world."

The President said that he would ask a merchant of New York, whose name was the synonym of probity, patriotism, sense and success to respond to this toast, and called on Mr. A. A. Low.

RESPONSE OF A. A. LOW, ESQ.

MR. PRESIDENT—I perceive that in the arrangements of the evening you have assigned the longest toast to the "shortest man." [Laughter.] I can imagine that it would have contributed very much to the comfort and enjoyment of this large assemblage, if some other one than myself had been designated to respond to this toast. Even now, as I look around upon this array of eminent men—members of the clergy, the bench and the bar, and others high in station, I should feel prompted to seek out a friend to speak in my behalf, did not I recollect how many a good text has been lost in the expansive proportions of a long discourse, and how many a brilliant sentiment has been dimmed by the superior luster of the finished speech, or weighed down by the exuberance of a fertile fancy.

From perils such as these the toast you have committed to my charge is safe in my keeping ; and, if it fall of happy illustration through any imperfection of my speech, it shall remain to this audience, unobscured by many words, in all its native truth and strength.

Considering the nature of the toast, it would have been natural to have called upon some one more familiar than myself with the administration of public affairs, who could have told us what influence the "short, sharp, and decisive" click of Prof. Morse's batteries has exerted in toning down the voluminous correspondence that has been pouring forth these seven or eight years past from the Department of State to the confusion of I know not how many British Ministers ; who could have told us what prospect there is that all our differences with the "Mother country" (as we are prone to say) will soon be settled ; in a word, when the losses by the Alabama and Florida will be paid, and whether in greenbacks or gold (a question that will be pretty sure to arise if our Government gets possession of the money) ; or whether all these claims are to be liquidated by a series of dinners given to the American Minister in England, by the Lairds of the land ; for, if these are to be adjusted in the latter

mode, we would like to enter into our Minister's joy. But, perhaps, it was conjectured, and rightly, too, that if information were sought on any or all of these points from diplomatist or statesman, we should have been met with the ready answer that it is wholly incompatible with the public interest to divulge State affairs. Let us then abide in the patient hope that through the good offices of the British Minister, whose presence is so welcome with us this evening, and through other instrumentalities, all will yet be right. [Applause.]

But, sir, whatever facilities the telegraph affords to speedy communication, I am willing to believe that it does not remove, in any important degree, the difficulties that attend the adjustment of delicate questions between great and powerful nations.

I am led to this conclusion when reasoning from analogy, for I do assure you that this invention of Professor Morse has brought very great perplexity to the merchants of the Old World, and to the oldest merchants of the New World, and it matters little whether a man is of Dutch, New England or even Scotch descent, whether he gets up early or late, whether he lives up town or in Brooklyn—where he is "handy to his place of business"—letters and invoices are rendered stale and unprofitable, and the calculations of the most sagacious are baffled by this new method for the dissemination of useful knowledge.

I had thought of drawing a contrast between the past and the present in illustration of this point, but my friend Mr. Dodge, who is shortly to speak for the merchants of this city, will touch upon this theme, and I may be allowed to say that, although Mr. Dodge lectures on New York as it was "fifty years ago," he is one of the youngest men among us, and the most ready to adapt himself to the new ways. [Laughter and cheers.]

Mr. Chairman, it sometimes happens that we do not fully appreciate our choicest gifts and greatest blessings till we are deprived of them or threatened with their loss. What stockholder in the Atlantic Telegraph does not shudder every Spring when those gigantic icebergs come rolling down from their freezing home in the North, and, turning their cold shoulders to modern invention, out in twain the nerve of our international system—paralyzing it throughout its entire length, and crushing the hopes of our friend Field at the same time. It is providentially ordained that these massive icebergs, foes to the mariner and inventor alike, shall, in their progress to the South, be dissolved in the warm waters of the gulf stream, even as the cold abstractions of the rationalistic mind, emanating from the frigid zone of human thought, melt away as they come in contact with the atmosphere of warmth that dwells in the hearts of the true disciples of Christ, or disappear, serving only to neutralize the tendencies to bigotry, superstition and oppression that spring up in the pathway of religious life.

But it is time that I approach the sentiment that underlies the toast, and at the very outset I am met with a grave doubt of the truth of the sentiment itself, for who does not recollect how, at the outbreak of our civil war, when Senators and Representatives rushed from their seats in Congress, the Prince of Evil touched the wires, and the fires of treason blazed up throughout the South, spreading from State to State, converting our "wayward sisters" into wayward demons, and filling the land with the spirit of evil ? and all this was done as quickly as our friend Stewart, applying the same electric touch to his thousand burners, throws a blaze of light upon the fair fabrics he has gathered from all parts of the world, while his own benignant face wears the smile, as it were, of perpetual youth that is reflected back from the delighted faces of his fair customers.

Mr. Chairman, I will cite but one illustration in proof of the toast ; it is familiar to all. I refer to the earlier days of the war of the rebellion, when Mason and Silldell were seized on board the Trent. None can forget the frenzy of passion into which the people of Great Britain were thrown by the tidings of this event ; how regiment after regiment was sent off to Canada, how ships of war were prepared for sea, and "John Bull" was making ready to let go all "the dogs of war." Now had the telegraphic wire been laid at that time, all the passion and all the expense of this unfriendly demonstration had been spared ; for I was reading only a few days ago that our lamented President, that just and good man, resolved on the day he heard of the seizure, that the commissioners should be surrendered.

Leaving the present and past, let us now forecast the future, and anticipate the dawn of the coming day, when our great Captain, raised to the highest office in the gift of a grateful people, first by acclamation and then by the popular vote, shall sit enthroned in his chair of State—no, not enthroned, but clad in the simple habiliments of justice and of truth, and touching the keys of communication with the remotest parts of our own land and with all lands, shall flash forth those magic words that lately thrilled the American heart with joy, along every line—not that line which stretches from the Wilderness to Richmond, and from Richmond to Petersburg, so lately red with blood shed in fraternal strife, but along every line, under every ocean and every sea and every separating river, to every court in Christendom, and to the remotest peoples of the world, "Let us have peace !" and there shall come back in letters of golden light, "Do as you would be done by" and all causes of misunderstanding shall speedily vanish away ! [Applause.]

The eighth toast was :

"The Press and the Telegraph, co-operating in the diffusion of intelligence ; the Telegraph to bring it from afar, the Press to spread it abroad." Upon announcing it the President said, I will venture to call upon a gentleman whose name is known

wherever the English language is spoken, who has rendered great public service in a long and most honorable connection with American Journalism, but whom we like best by his best name, the beloved American Poet, to respond to this sentiment. Will Mr. Bryant allow us to hear from him?

SPEECH OF THE HON. WM. OULLEN BRYANT.

I speak, Mr. President, in behalf of the press. To the press the electric telegraph is an invention of immense value. Charles Lamb, in one of his papers, remarks that a piece of news, which when it left Botany Bay was true to the letter, often becomes a lie before it reaches England. It is the advantage of the telegraph that it gives you the news before circumstances have had time to alter. The press is enabled to lay it fresh and fresh before the reader. It comes to him like a steak hot from the gridiron, instead of being cooled and rendered flavorless by a slow journey from a distant kitchen. A battle is fought 3,000 miles away, and we have the particulars while they are taking the wounded to the hospital. A great orator rises in the British Parliament, and we read his words almost before the cheers of his friends have ceased. An earthquake shakes San Francisco, and we have the news before the people who have rushed into the street have returned to their houses. I am afraid that the columns of the daily newspapers would now seem flat, dull, and stale to the reader were it not for the communications of the telegraph.

But while the telegraph does this for the press, the press in some sort returns the obligations. Were it not for the press, the telegram, being repeated from mouth to mouth, would, from the moment of its arrival, begin to lose something of its authenticity. Every rumor propagated orally at last becomes false. Mr. President, you are familiar with the personification of Rumor by the poets of antiquity—at first of dwarfish size, and rapidly enlarging in bulk till her feet sweep the earth and her head is among the clouds. The press puts Rumor into a straight jacket, swaddles her from head to foot, and so restrains her growth. It transcribes the messages of the telegraph in their very words, and thus prevents them from being magnified or mutilated into lies. It protects the reputation of the telegraph for veracity. You know, Mr. President, what a printer's devil is. It is the messenger who brings to the printer his copy—that is to say, matter which is to be put into type. Some petulant, impatient author, I suppose, who was negligent in furnishing the required copy, must have given him that name: although he is so useful that he is better entitled to be called the printer's angel, the original word for angel and messenger being the same. Our illustrious guest, Mr. President, has taken portions of the great electric mass, which in its most concentrated form becomes the thunderbolt, he has drawn it into slender threads, and every one of these becomes in his hands an obedient messenger—a printer's devil carrying with the speed of a sunbeam volumes of copy to the type-setter.

In the Treatise on Bathos, Pope quotes, as a sample of absurdity not to be surpassed, a passage from some play, I think one of Nat. Lee's, expressing the modest wish of a lover:

"Ye gods, annihilate both space and time,  
And make two lovers happy."

But see what changes a century brings forth. What was then an absurdity, what was arrant nonsense, is now the statement of a naked fact. Our guest has annihilated both space and time in the transmission of intelligence. The breadth of the Atlantic, with all its waves, is as nothing, and in sending a message from Europe to this continent, the time, as computed by the clock, is some six hours less than nothing.

There is one view of this great invention of the electric telegraph which impresses me with awe. Beside us at this board, along with the illustrious man whom we are met to honor, and whose name will go down to the latest generations of civilized man, sits the gentleman to whose clear-sighted perseverance and to whose energy—an energy which knew no discouragement, no weariness, no pause—we owe it that the telegraphic cable has been laid which connects the Old World with the New through the Atlantic ocean. My imagination goes down to the chambers of the middle sea, to those vast depths where reposes the mystic wire on beds of coral, among forests of tangle, or on the bottom of the dim blue gulfs strewn with the bones of whales and sharks, skeletons of drowned men, and ribs and masts of foundered barks, laden with wedges of gold never to be coined, and pipes of the choicest vintages of earth never to be tasted. Through these watery solitudes, among the fountains of the great deep, the abode of perpetual silence, never visited by living human presence and beyond the sight of human eye, there are gliding to and fro, by night and by day, in light and in darkness, in calm and in tempest, currents of human thought borne by the electric pulse which obeys the bidding of man. That slender wire thrills with the hopes and fears of nations; it vibrates to every emotion that can be awakened by any event affecting the welfare of the human race. A volume of contemporary history passes every hour of the day from one continent to the other. An operator on the Continent of Europe gently touches the keys of an instrument in his quiet room, a message is shot with the swiftness of light through the abysses of the sea, and before his hands is lifted from the machine the story of revolts and revolutions, of monarchs dethroned and new dynasties set up in their place, of battles and conquests and treaties of peace, of great statesmen fallen in death, lights of the world gone out and

new luminaries glimmering on the horizon, is written down in another quiet room on the other side of the globe.

Mr. President, I see in the circumstances which I have enumerated a new proof of the superiority of mind to matter, of the independent existence of that part of our nature which we call the spirit, when it can thus subdue, enslave, and educate the subtlest, the most active, and in certain of its manifestations the most intractable and terrible of the elements, making it in our hands the vehicle of thought—and compelling it to speak every language of the civilized world. I infer the capacity of the spirit for a separate state of being, its indestructible essence and its noble destiny, and I thank the great discoverer whom we have assembled to honor for this confirmation of my faith.

The ninth toast was—

"The telegraph in the United States."

The President said he knew no one who could more fitly respond to it than the gentleman who presides so well and so worthily over the American telegraph system, and called upon Mr. Orton. [Applause.]

SPEECH OF WILLIAM ORTON, ESQ.

Mr. Chairman, I am not insensible to the honor conferred, not only upon the American telegraph system, but on myself, in being requested to respond to this sentiment. But I trust, sir, you will bear in mind these material facts concerning the telegraph:—It speaks only to a private ear, addresses nothing to the public, responds to no complaint except in satisfaction to the complainant, and has nothing to allege even in its own defense.

Its past history in America has just been recounted to us by our honored guest—its distinguished founder—the founder not only of the American system, but of that now in almost universal use throughout the world.

At the present time the American telegraph may be considered as on trial, but so far as this occasion is connected therewith, it feels honored that the trial is in the presence of one of its earliest friends, the Chief-Justice of the United States, and that among its advocates is the distinguished Attorney-General of the United States. The issue to be tried, is whether the telegraph, the product of American genius, shall be permitted to achieve the highest results of American enterprise, under private control, or be driven from the field if it refuse to surrender, to give place to such a system as will result from attaching it to a department of the Government, and leaving its management dependent upon the changing conditions of political favor.

There is now pending before the House of Representatives a bill introduced two years ago, which is generally understood to provide for the transfer of the telegraph to a Department of the Government. It occurs to me, sir, at this moment, that there is an almost universal misapprehension concerning the facts in this case.

The question is not whether the existing telegraph lines shall be taken possession of by the Government, and administered hereafter as a department of its service, but whether the Government, which refused at the outset to acquire control of this great invention, shall now enter the field of private enterprise as a competitor against existing interests; and I propose, in the minute or two which I shall devote to this subject in response to the sentiment which has been announced, simply to make the nature of this proposition clear.

The telegraph in the United States to-day is represented by more than 60,000 miles of line, and by more than 120,000 miles of wire. It exceeds by far in extent the telegraph system of any other Government on the globe, and approximates the combined systems of continental Europe.

It will transmit during the current year 18,000,000 messages, which, according to the reports of 1866, the last year for which we have complete returns, will be nearly equal to the whole number transmitted that year over all the lines in Europe.

Between the cities of New York and Washington there are now in operation three lines, controlled by separate corporate organizations, competing with each other vigorously, and a new competitor is now constructing a fourth line over a part of this route.

The scheme proposed by the pending bill, to which I have referred, is substantially for the Government to build another line between these points, and commence the operation of a separate and competitive system of its own, but with less aggregate facilities in wires than we are frequently required to give a single newspaper for the transmission of its Congressional reports.

Within a year and a half the British Government decide

to open negotiations with private parties controlling the telegraph in that kingdom, with a view to connect the telegraph with the postal service, and the Committee appointed under act of Parliament has completed its negotiations. The result of these negotiations is substantially that the lines of the private corporations in operation in Great Britain shall be acquired upon payment of 20 times the profits of the year 1868. That is to say, they discount on the basis of the business of the present year, the profits for 20 years to come, and pay them over to the owners of this property. I submit, in marked contrast to this British scheme, the proposition pending before the American Congress, which, by a practical repudiation of the results of private enterprise, proposes no payment for what that enterprise has accomplished, recognises as of no value the invention which was offered to it at the outset for the pittance of \$100,000, but, with the treasury of the United States at its back, proposes that the Government shall embark as a competitor against its own citizens in a race for the destruction of their property. [Applause.] It is to me a matter of great gratification, that with one or two exceptions, concerning which a sufficient explanation could be given, if it were necessary, the press of the United States has either been silent or has pronounced its verdict of opposition to this scheme. [Applause.]

There is between the telegraph and the press an intimate relation, and that relation is nowhere so intimate as in the United States. There cannot be an absolutely free press without a free telegraph, and there can nowhere be so free a press as under our own Government. The arrangement under which the press is served by the telegraph in the United States is unique and peculiar. There are local and general combinations of the press, each separately and both combined operating under the co-operative system in connection with the telegraph, by which the news from all parts of the country is gathered to common centers, from which it is distributed again to the papers of the several localities. Under this arrangement, the Company with which I am connected, and which controls about 90 per cent. of the wires of the United States, and transacts more than 95 per cent. of the business, will deliver during the current year, to the press of the United States, more than 350,000,000 words of press matter [applause], which, divided by 20—the unit of messages on the Continent of Europe—will about equal the messages transmitted by all the lines of Europe, including Great Britain, during the same time: their compensation for that service being in the neighborhood of fourteen millions of dollars, and ours for this specific service to the press being about eight hundred thousand dollars. [Applause.] I submit whether such a service demands governmental interference [applause], and especially whether the telegraph should be placed under the control of a department of our government which at present acknowledges a deficiency of more than \$6,000,000, and which the Postmaster-General anticipates may be increased within a few years to \$10,000,000.

The single company with which I am connected is now paying more than \$300,000 per annum to the revenues of the country in taxes—national, State and municipal; and I submit whether, on grounds of economy alone, it is worth while to risk the loss of this sum by destroying the business which yields it—and adding its management to a Department which confesses inability to conduct its own affairs, except at an enormous current loss which it assures us will steadily increase.

We are told there is no doubt concerning the ability of the British Government to operate the telegraph at lower rates of tariff than have hitherto prevailed in that country. I am not prepared to controvert this. A Government which has shown its capacity for economic management by making profits out of the penny postage system, may, perhaps, be able to operate the telegraph successfully; but the ability of our Government to do this has no such demonstration. On the contrary, while the British Government derives an immense revenue from spirits at the rate of about two dollars and a half per gallon in gold, I believe there is no one so bold as to assert, that here, the attempt to enforce a much lower rate has, thus far, been more than partially successful.

In view of the facts presented, I submit that common justice and ordinary business prudence, dictate that our Government shall not interfere with American telegraphs, either as a competitor or as a monopolist, but that they be permitted to enjoy in the future the full benefit of that enterprise and sagacity which are the peculiar characteristics of our citizens, and which will in due time provide liberally for every just demand in every department of human affairs.

The tenth toast was—

"The Extension of the Telegraph. It has no limit short of the whole habitable globe."

The President observed that Mr. David Dudley Field, by his labors and codification, had brought all cultivators of Jurisprudence in his debt, while achieving for himself a distinguished reputation among the foremost of American lawyers by his previous labors, and requested him to respond to the toast.

#### RESPONSE OF DAVID DUDLEY FIELD.

MR. CHAIRMAN AND GENTLEMEN—In the early days of the electric telegraph, a proposition was made that it should be called the Morsograph. I cannot but think that would have been a distinctive and appropriate designation, recalling in all future time as the thing should be mentioned, the history of its origin. But the name of the inventor is no secret, and the world will ratify the judgment we pronounce to-night that, as benefactor and discoverer, his name will be immortal.

If we were to measure the future of the telegraph by what has been already accomplished, we should predict for it an indefinite extension. Less than twenty-five years ago the first line was constructed in the United States. Though it extended only from Washington to Baltimore, it was begun in doubt and completed with difficulty. Thence it stretched itself out first to Philadelphia and New York, then to other principal cities, and afterwards along the great thoroughfares. On the other side of the sea it advanced, as it advanced here, from city to city, and from one market to another. At first laid with hesitation underneath the rivers, it was next carried under narrow seas, and at last plunged into the ocean, and passed from continent to continent. Compare its feeble beginning with its achievement of to-day. Think of the uncertainty with which after weary months upon dusty Maryland roads the last link of that first line was closed, and then think of the exultation with which the great ships in mid ocean lifted up the slender wire from the bottom of the sea, two miles down, when the problem was forever solved, not only that an ocean telegraph was possible, but that it could not be so lost that it might not be found.

Standing in the presence of the great inventor, I am constrained to congratulate him upon the fullness of his triumph, as he remembers the early effort, and contrasts it with the marvels of this night in this hall. That little instrument, no larger than the clock upon the chamber mantel, and making as little noise, is yet speaking to both America and Europe; and what it says will be printed before the dawn, and laid at morning under the eyes of millions of readers! Did I say before the dawn? It will meet the dawn as it advances over the Caspian into Eastern Europe. In the opposite quarter, we know that the message which has just left us for the West will outstrip the day. Even while I have been speaking, it has crossed the Mississippi, passed the workman laying the farthest rail of the Pacific road, bounded over the Sierra Nevada, into the plains of California, as the last ray of to-day's sun is fading from the shore, and the twilight is falling upon the Pacific sea. [Applause.]

It is, however, not alone its history which justifies us in predicting for the telegraph indefinite extension. Its essential character must, sooner or later, carry it to every part of the habitable globe. Of all the agencies yet vouchsafed to man, it is the most accessible and the most potent. While the machinery itself is cheap and simple, the element from which it is fed is abundant and all pervading. It is in the heavens above, in the earth beneath, and in the water under the earth. You take a little cup and pass into it a slender wire, when lo! there comes to it a spark from air and water, from the cloud and the solid earth, which the highest mountains cannot stop nor the deepest seas drown, as it dashes on its fiery way, indifferent whether its errand be to the next village or to the Antipodes. No other tongue can speak to the farthest and the nearest at the same time. No other hand can write a message which may be delivered within the same hour at Quebec and at Moscow. No other voice can reach at once the farmer of Illinois and the merchant of Amsterdam; the German on the Danube and the Arab under his palm.

To the use of such an instrument there can be no limit but the desire of man to converse with man. If from this populous and opulent capital you would speak with any inhabitant of either hemisphere, you have here an agent which may be brought to do your bidding. If any, however distant, desire to speak with you, they have these

means at their command. How great will be the effect of all this upon the civilization of the human race, I do not pretend to foresee. But this I foresee, as all men may, that the necessities of governments, the thirst for knowledge, and the restless activity of commerce, will yet make the telegraph girdle the earth and bind it in a network of electric wire. The Atlantic, the most dangerous and difficult of all the seas, has been crossed. In the Pacific you may pass easily from island to island, till you reach the shores of Eastern Asia. There an American company will take it up and extend it from side to side of the Central Flowery Land. And an English company is about to cross the straits which divide Australia from the elder continent. Indeed, I think that I declare not only what is possible, but what will come to pass within the next decade, when I predict that there will be a telegraph office wherever there is now a post office, and that messages by the telegraph will pass almost as frequently as messages by the mail.

Then the different nations and races of men will stand, as it were, in the presence of each other. They will know one another better. They will act and re-act upon each other. They may be moved by common sympathies and swayed by common interests. Thus the electric spark is the true Promethean fire which is to kindle human hearts. Men then will learn that they are brethren, and that it is not less their interest than their duty to cultivate good will and peace throughout the earth.

The President announced, as the next toast—

"The Merchants of New York, whose wealth and public spirit have carried the fame of American enterprise around the world."

And called on the Hon. William E. Dodge to respond in behalf of the merchants, stating that he called upon a gentleman who was himself a distinguished merchant, and whose character stands in flat contradiction with his name.

#### RESPONSE OF W. E. DODGE, ESQ.

MR. PRESIDENT—The lateness of the hour forbids my doing more than, through you, to thank the committee for the kind manner in which they have referred to the merchants of New York, and to what they have been able to do for the honor of the country while prosecuting their commercial interests all over the world.

If the army and navy, diplomacy, science, literature and the press can claim special interest in the telegraph, surely the merchant must have as deep an interest; but I am not prepared to say that it has proved to be an unmixed blessing to them. My friend Low, when he made reference to this, and kindly left it for me to expand, touched a chord which vibrated in the heart of every merchant present. The merchants of New York referred to in the resolution embrace those of the past as well as the present; but, sir, there has been a wonderful change. The merchants forty years ago, with all their high commercial integrity, industry and ability, were very different from those of to-day, and you, sir, our honored guest, under God, have wrought this change.

Before the telegraph and steamers were introduced, the merchants engaged in foreign commerce, as they decided upon their voyages and adventures, were only guided by the probabilities of the distant markets, and were obliged to calculate on a rate of profit which would cover all the risks. But many of our largest houses, while busily engaged in fitting out their ships and consignments, or in receiving their returns, had in the intervals time for reflection and rest, though often anxious to learn the result of shipments and adventures which it took months to complete. In those days they had packets for London or Liverpool twice a month, by means of which they corresponded with all parts of the world.

Those engaged in the home trade had their active seasons, for in the spring and in the fall their country customers made their semi-annual visits to the city; but there was time and opportunity to converse with them, and pay to them all due attentions. And in the summer and winter there was time to rest, and to look over accounts and make plans for the future. Comparatively they had an easy time.

But now all this is changed, and there are doubts whether the telegraph has been so good a friend to the merchant as many have supposed. Now, sir, reports of the principal markets of the world are published every day, and our customers are continually posted by

telegram. All the merchant can expect is a very small profit or commission. Instead of making a few large shipments in a year, he must keep up constant action, multiplying his business over and over again, using the telegraph to save time and capital. He has to keep up constant intercourse with distant correspondents, knows in a few weeks the result of shipments, which, a few years ago, would not have been known for months, orders the proceeds invested in commodities, the value of which is well understood, and which are again sold before their arrival. He is thus kept in continual excitement, without time for quiet and rest. Now, with fast steamers arriving and departing almost daily, taking time for the details of transactions completed days before by telegraph, the making of invoices and writing of letters becomes stale and uninteresting; but it must be done, and the merchant goes home, perhaps, after a day of hard work and excitement, to a late dinner, trying amid the family circle to forget business, when he is interrupted by a telegram from London, brought to the house because the store is closed, directing, perhaps, the purchase in San Francisco of 20,000 barrels of flour, to be shipped at once, and advising of £30,000 at his credit with Baring Brothers & Co., and the poor man must dispatch his dinner as hurriedly as possible in order to send off his message to California. Now I submit, Mr. President, whether such an experience would be an aid to the proper digestion of his dinner.

The merchant in the home trade is no better off. He has no rest. The customers in all the principal towns and villages of the country have daily knowledge of the state of the New York markets, and, instead of visiting the city in the spring and fall as formerly, they transact their business by letters and telegrams, thus keeping up a constant activity and compelling the New York merchant to multiply and increase his transactions as his only chance to prosecute his business successfully. A few years ago a merchant doing business in St. Louis would order 100 boxes of tin shipped via New Orleans. His letter by mail-coach would reach New York in 10 days, the shipment would be made in a packet, sailing, say in a week, with a passage of perhaps 15 days, then a week for unloading, and the re-shipment would be made on a steamer for St. Louis; and in about six weeks from the date of his order he might have expected to receive the tin. Now he orders by telegraph, the dispatch is re-sent to New Orleans where a supply is kept, the tin is shipped on the same day, and, in a week from the date of his order, he has it in his store in St. Louis.

Mr. President, for this new order of things there is no substitute. The business man of the present day must be continually on the jump, the slow express train will not answer his purpose, and the poor merchant has no other way in which to work to secure a living for his family. He must use the telegraph. [Laughter and applause.]

And all this results from the invention of our venerable friend. [Cheers.]

When Mr. Dodge had concluded, the President remarked that he had never known before how much the New York merchants were to be pitied, and that the picture of their suffering and hardships which had been drawn by one of the most eminent and successful among them was a great comfort to poor folks. He then called upon Hugh Allan, Esq., President of the Montreal Telegraph Company to respond to the twelfth toast.

#### SPEECH OF HUGH ALLAN, ESQ.

I beg leave, on the part of the Dominion of Canada, to acknowledge our great obligations to the distinguished man, in whose honor we are this day met, for his wonderful discoveries in telegraphy.

We claim the merit of an early appreciation of their importance, inasmuch as the Montreal Telegraph Company was established as long ago as in 1846. In the following year the first line in Canada, from Montreal to Toronto, was opened, and its progress from that time till the present, has been steady and continuous. It has now about 9,000 miles of wire strung on its poles, besides several cables under rivers and canals, and the number of messages sent over its lines this year will exceed 750,000. It has 482 offices in the Dominion for public business, which is one for every 7000 inhabitants. Its tariff is the lowest on the continent of America, notwithstanding which it has always yielded fair dividends. What would our country, with its comparatively few and thinly scattered inhabitants, its long winters, its frosts and its snows, have been without this great discovery?

Just in proportion to the advantages it has conferred on us are our obligations to Professor Morse, and as a pleasing proof of the universality of this sentiment, I ask your

permission to read to you some telegrams which have reached me since I sat down at this table by means of the instrument working in the corner of the

MONTREAL, 8 P. M., 29th December.

Honor to the man to whose genius this Dominion is indebted for sharing with his own country the advantages of an unequalled system of telegraphs. [Cheers.]

QUEBEC, 7.30 P. M., 29th December.

The ancient capital of Canada desires to accord to Professor Morse its gratitude for the benefits his genius has conferred on mankind.

OTTAWA, 7.30 P. M., 29th December.

This northern city, now the seat of the Government of the Dominion, joins in the universal praise to Professor Morse for his most valuable telegraphic discoveries.

TORONTO, 7 P. M., 29th December.

Western Canada adds her testimony to the obligations the world is under to Professor Morse for all he has done.

SACKVILLE, Nova Scotia, 7 P. M., 29th December.

The Blue Noses are not behind in their tribute of thanks to Professor Morse. May he see many happy returns of this festive season.

SARNIA, C. W., 7 P. M., 29th December.

East, West, North and South desire to join in toasting health and happiness to Professor Morse. [Great Applause.]

I cannot close these remarks without paying a tribute of respect and admiration to another of your eminent citizens now present, whose exertions in the spread of telegraphy have been unequalled. Being connected with the Atlantic Telegraph Company as an honorary Director, I can bear testimony that the accomplishment of that enterprise is in a great degree owing to the energy, activity and perseverance of Mr. Cyrus W. Field. I was present at the meeting of the Directors in London when the Great Eastern returned after the loss of the cable in 1865.

The prevailing feeling was despondency until Mr. Field entered the room. His first words were: "Gentlemen, we are now assured of success in our enterprise. We have proved that we can pick up the ends of the broken cable, and the rest is only matter of detail." His cheerful words, and the energy with which he stated his views, infused new life into every one present, and the result was a determination to persevere till success was attained. Mr. Field has, therefore, well merited all the honor we can pay to him, and I have pleasure in bearing testimony to his great services. [Great applause.]

The thirteenth toast was—

"The Telegraph in the East."

THE PRESIDENT said—We are gratified to have among us tonight a distinguished citizen of Pennsylvania, who, having served his country with marked ability as Governor of that Commonwealth during the recent civil war, is now devoting his energies to pushing telegraphic communication beyond the sunrise, and called upon Governor Curtin, who spoke as follows:

GOVERNOR CURTIN'S SPEECH.

GENTLEMEN: It would have been no easy task a few years ago to respond to the sentiment proposing the extension of the telegraph to the East. In this enlightened presence it would have required more than the ardor of the enthusiast to declare that the trained lightning would yet carry its swift message from the new to the old world, from America to Europe. A few would have listened, fewer still would have believed, and the rare men of progress who would have responded with their energy and means to attempt the herculean task, would have been marked as infatuated dreamers.

Less than twenty years since the daring genius that proposed the extension of the telegraph to the East, divided from us by but two thousand miles of sea, was charitably regarded as bewildered by his devotion to a great idea. Hesitating governments gave grudging and reluctant aid, and repeated failures but strengthened the conviction that the achievement was impossible; but the greatest modern triumphs of civilization are due to the undaunted men of inspired genius and unflinching faith, who staked fortune and reputation upon success. This blessed land of ours, the fountain of Christian progress, gave to the world the heroes of this matchless triumph of scientific and civilizing advancement.

The names of Morse and Field will brighten the pages of our history as among our noblest benefactors, who have won victories "more renowned than war;" the first, who tamed the terrible lightning of the heavens, and made it the gentle missionary in the great work of enlightened prosperity and peace; and the last, who set the brightest jewel of success in the crown of science. [Applause.] The telegraph was extended to the East, and continents record each other's passing history from day to day.

With that great triumph, the march of American progress was regarded as having perfected its greatest task, and in our rejoicing then no one dreamed that the present generation, or even the present century, would understand the broad significance of the sentiment which is proposed, as the world understands it to-night. The East is no longer Europe, either in

geographical or mercantile acceptation. It means the cradle of the human race. It means advancement from the new-born republic of the Western world onward to the ancient empires of Asia.

Romance pales before the beneficent and substantial progress of the age in which it pleased Providence to cast our lot. The wildest dreams of science and philosophy have been more than realized, and each decade marks the mighty strides the last had hoped for only in coming ages. I can remember well when the question of connecting the Ohio and the Delaware rivers agitated the people of my native State. Prejudice and ignorance resisted stubbornly, but free schools and internal improvements came hand-in-hand to give us greatness. Brave men fell under popular reprobation, because they expended a few millions to give back incalculable wealth, and the priceless boon of universal education.

Our turnpikes were the first slow, hesitating steps in progress, the tottering, timid footprints of infancy. The State stretched out its bounty and commerce was quickened. They have passed away, and the account of capital invested stands unbalanced in the treasury; but who can estimate the dividends? With trembling and fear a college here and there was established, and soon came the common schools to hasten progress alike in the improvement of rich and poor. Then came our great canal and our primitive railroad; but, imperfect as they were, unwisely as they were managed, and fruitless as they appeared on the balance sheet of the Commonwealth, they were a great artery of commercial and national life—a vast stream of progress that was steadily advancing our people and making them nobler and richer from year to year. They, too, have almost faded away before the march of the iron horse, whose rude music is heard over nearly four thousand miles of railroad in the State, but they added millions to the wealth of Pennsylvania. The Empire State, too, had its like struggles with the ever stubborn, persistent enemies of advancement, but her beneficence reared the noblest monuments of progress, and spread prosperity in profusion throughout her people. New England has created her countless wealth. Her liberal laws have given the richest fruits in intelligence, in science, in philosophy, and in all that ennobles the human race; and all these are but the expanding inspirations of the old world as the course of empire follows the setting sun.

From its fabled fountains in Asia the stream of progress started westward. It struggled for centuries for growth and expansion, it reared State after State in Europe, and braved the innumerable convulsions its determined and onward march provoked. Columbus at last pleaded its cause, but long in vain. He was repelled from court to court, and while the people of the North, in Holland and England, struggled for civil and religious liberty against the power of ignorance and oppression, the great navigator was commissioned by the most intolerant despotism of Europe to open the Western World to the richest triumphs of our civilization.

Europe learned new lessons and advanced. Ignorance and its handmaid, despotism, made fearful war against the progress of liberal ideas, but westward and still westward the tide of civilization was marching, liberalizing and expanding as it marched, until in the new-born republic freedom was opened to men; and this steadily expanding current of civilization still follows the setting sun. It crossed the Alleghenies, then the father of waters, then planted its banner on the golden shores of the Pacific, and finally made the valleys of the Rocky Mountains blossom with beauty and plenty. [Applause.]

Nor was its influence confined to our continent. The Old World and the New were alike inspired, and the fountains grew better as the stream advanced and purified. Liberalism has had healthy and rapid growth there. Thus westward from the cradle of the east the tide of progress has marched, growing as it advanced, and rearing its lasting monuments of greatness as it hastens to return its priceless treasures to its Eastern home. [Applause.]

As the people advance in intelligence their governments advance in every attribute of greatness. Europe is now traversed by railroads, and England, foremost in liberal progress in the Old World [applause], has given four hundred and forty millions of dollars to enlarge her East India possessions—not by war, but by telegraphs and railroads. In a few years, through the far-sighted statesmen of European nations, there will be a continuous line of rail from Dover to the Bosphorus; thence down the Euphrates, across Persia to India, and from thence it must eventually reach China and Japan. The tide of progress, ever growing as it reaches westward, now records the wonderful history of our own beneficent Government constructing a great railroad across the Rocky and Sierra Mountains to the Pacific, when the nation was in the agony of conflict with the most gigantic rebellion of recorded time. [Renewed applause.] The next anniversary of the Independence of the Republic may be celebrated in the heart of the mountains by people from the Atlantic and the Pacific, among fruitful fields and happy homes, where twenty years ago was the American desert. The telegraph, too, not only spans the continent, but reaches to the British possessions in the North, and to the foreign governments in the South. Before another five years shall have elapsed I trust that three great trunklines of railroads will cross the plains and mountains to the Pacific, and reward the beneficence of our Government by countless wealth, by growing empires, by general prosperity and peace; and with the completed railroads to the western shore of the continent, the old

Eastern nations will turn from the setting to the rising sun to welcome and gather the fruits of their children.

As the railroad and telegraph—those living, progressive monuments of enlightened advancement—stretch out around the world, encircling Christian and heathen in their embrace, the great interests of man will be cemented in chords of unity. Facilities for cheap travel, for quick exchanges, for the widespread diffusion of intelligence and liberal ideas, must make nations homogeneous, and make peace the first interest of all. The song of the iron horse on land, and the silent currents of business over the cable in the sea, will be ever-growing bonds of concord, enlarging trade, diversifying industry, ennobling patriotism, and gradually gathering the whole world in the folds of our enlightened progress.

The telegraph must now reach the East, and be the forerunner of the great harvest of civilization. From San Francisco to the Asiatic coast the submarine cable will soon bear messages of progress and infuse the love of advancement into the commercial cities of China and Japan. It is a theme worthy of our triumphant civilization. It is an enterprise that will bear with it the noblest fruit of literature, science, art, government, and religion. Starting from the darkness of Asia, and after traversing and illuminating the world in its march, it now returns with its trophies to four hundred millions of the human race who are still strangers to its blessings. It will break the crust of superstition; it will rapidly dispel ignorance; it will quicken and enlarge commerce; it will make railroads and fleets to increase their wealth, and will be the great missionary to evangelize them from heathen darkness.

"The extension of the telegraph to the East" will be the crowning triumph of the civilization we so fondly and justly claim, and soon the commerce of the Oriental cities will turn from the East to the East, land on our Pacific shores, and sweep across our continent to our great cities, and to the marts of Europe, and then the lightning messenger will encircle the whole world, to bear the glad tidings of prosperity and peace to all mankind. [Continued applause for some minutes.]

The fourteenth toast was—

"The beauties of the fine arts are based on the foundations of science."

The PRESIDENT called on Mr. Daniel Huntington who now occupies the chair of President of the Academy of Fine Arts, which was first filled by the honored guest of the evening, to respond.

MR. HUNTINGTON'S REMARKS.

The sentiment of this toast few will doubt. At this late hour I will not consume the time in enlarging on its truth. It will be generally admitted that structure and proportion lie at the root of all perfect expression of character, generally in all visible objects, but pre-eminently in the human figure, the most difficult and the highest subject of the artist's study.

An exact perception of gradation and relation in light and shade, only can enable the artist to portray cunningly the flow of light and the relief of forms; and even the more subtle and evanescent charms of color depend on the laws of light, the relations and quantities of the colored rays; so that even these fleeting beauties are obedient to laws as absolute as those which guide the stars in their courses. In the present instance, however,—I mean that of our illustrious guest,—it might seem that the noble fruit of scientific discovery had sprung from the tree of art, for he chose art for his first mistress; there he won his earliest laurels, carrying off the prizes in foreign exhibitions, winning the praise of the highest judges in sculpture as well as painting, and founding in our city an Academy of Design, whose affairs and studies he guided as President for many years. Mr. Durand, who succeeded him, will testify to the ardor of his devotion to art and the force and richness of his pencil. Perhaps, after all, the Committee or the printers have made a mistake, and intended the toast should read, "Scientific Invention, the natural fruit of the Fine Arts." Morse, the painter, invented the electric telegraph; Fulton, the painter, discovered steam navigation; Daguerre, an artist, gave us the photographic process.

In fact, however, every studio is more or less a laboratory. The painter is a chemist, delving into the secrets of pigments, varnishes, mixtures of tints, and mysterious preparations of grounds and overlaying of colors; occult art, by which the inward light is made to gleam from the canvass and the warm flesh to glow and palpitate.

The studio of my beloved master, in whose honor we have met to-night, was indeed a laboratory. Vigorous, life-like portraits, poetic and historic groups, occasionally grew upon his easel; but there were many hours—yes, days—when, absorbed in study among galvanic batteries and mysterious lines of wire, he seemed to us like an alchemist of the middle ages in search of the philosopher's stone. I can never forget the occasion when he called his pupils together to witness one of the first, if not the first, successful experiment with the electric telegraph. It was in the winter of 1835-6. I can see now that rude instrument, constructed with an old stretching frame, a wooden clock, a home-made battery, and the wire stretched many times around the walls of the studio. With eager interest we gathered about it, as our master explained its operation, while with a click, click, the pencil, by a succession of dots and lines, recorded the message in cypher. The

idea was born. The words circled that upper chamber as they do now the globe. [Applause.]

But we had little faith. To us it seemed a dream of enthusiasm. We grieved to see the sketch upon the canvass untouched. We longed to see him again calling into life events in our country's history, but it was not to be. God's purposes were being accomplished, and now the world is witness to his triumph. [Applause.]

Yet the love of art still lives in some inner corner of his heart, and I know he can never enter the studio of a painter and see the artist silently bringing from the canvass forms of life and beauty, but he feels a tender twinge as one who catches a glimpse of the beautiful girl he loved in his youth whom another has snatched away.

Finally, my dear master and father in art, allow me in this moment of your triumph in the field of discovery, to greet you in the name of your brother artists with "all hail." As an artist you might have spent life worthily in turning God's blessed daylight into sweet hues of rainbow colors and into breathing forms for the delight and consolation of men, but it has been His will that you should train the lightnings, the sharp arrows of His anger, into the swift yet gentle messengers of Peace and Love. [Applause.]

When Mr. Huntington had concluded his remarks, and after the announcement that on account of the absence of Col. Hoe, caused by indisposition, the fourteenth toast would not be responded to—the ladies who had graced the banquet by their presence began to retire, and before the fifteenth toast had been announced had nearly all left the room.

The President, however, announced the sixteenth and last toast,

"The Ladies,"

and said, this is the most inspiring theme of all; but the theme itself seems to be vanishing from us—indeed (after a pause), "has already vanished." (After another pause and a glance around the room), and the gentleman who was to have responded seems also to have vanished with his theme. I may assume, therefrom, that the duties of the evening are performed, and its enjoyments are at an end."

Accordingly, soon after 12 o'clock, midnight, the assemblage dispersed.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JANUARY 1, 1869.

A Happy New Year.

Crowded up as we find ourselves among the mass of matter connected with the great Banquet just given to Professor Morse, we feared that we would have been compelled to omit our ordinary New Year's congratulations, and issue the JOURNAL without a single kind word to our numerous friends and readers. We cannot afford to do this.

When Superintendents make the JOURNAL a gift to those who serve them; when they, like those in the good city of Portland, acknowledge with the instinctive promptitude of faithful men the acceptability of the gift; when letters of personal kindness come to us from those we never saw; when old friends send us turkeys for our Christmas table, and invoke blessings on our New Year, we would be less than manly did we not claim our accustomed page in which to utter our heartiest benediction on

them all. May blessings fall fast on all of you, and as many as the snow-flakes which are tracing their white lines past our window as we write.

### THE MORSE BANQUET.

We regard it as a happy beginning to the new year to be able to give the full proceedings of the great banquet given to Professor Morse by his friends and countrymen at Delmonico's, on the night of the 29th ult. It was an act of justice and of honor long delayed, and yet came when every thing had conspired to render it illustrious and complete. The splendor of the banquet; the dignity given to it by the presence of the Chief-Justice of the United States as its presiding head; the array of noble men who graced its central table, and indeed all its tables; the eloquence and warmth of all the addresses delivered; the presence of the tiny instrument which has united the world, and made its inventor famous; the venerable form of the pleased Professor accepting the great ovation in an address of great artistic finish and beauty in which, while asserting his own claims with modest manliness, he gave just credit to cotemporaneous inventors; the completed recognition by the nations of Europe of the merits of Professor Morse's claims which preceded this great demonstration of his countrymen; all rendered the occasion grand, beautiful, appropriate, complete. We were glad to see that his children were present to witness the crowning honor to a father whose name must be henceforth immortal.

There was one man sat at the central board, on whom many eyes rested, and who enjoyed the scene with a keener relish than his placid features denoted. It was the man who came to New York 24 years ago, and could not find within it one merchant who would invest one dollar in the enterprise which he had undertaken to introduce. Bravely conquering public apathy, bravely defending the assailed rights of the inventor through many a long and tedious suit, and at last triumphantly securing to Professor Morse that success without which mere renown would have been a worthless plume, Hon. Amos Kendall sat among his distinguished companions proud of all of which the banquet was the sequence and the crown. In some coming banquet, when the workers of the Telegraph will meet together, Mr. Kendall must give to us the unwritten history of the trials and triumphs of the Telegraph, supplemented by the stories of others who have performed much of its toil, and shared in its rewards.

We must apologise to all correspondents, advertisers, subscribers, and everybody, for the utter omission of all matter save the proceedings of the Banquet to Professor Morse. We deem these eminently worthy of record, and have bestowed much labor in getting every speech correct, and generally after the revision of those who uttered them. We do not think that we would have done justice to current history, or to him whom we all honor, had we omitted this duty. Our next number will be embellished with a neat likeness of Mr. Wade, as promised in our last.

We are compelled to omit until our next number the acknowledgement of Insurance Assessments received.

For Tariff Circular see page 34.

## OFFICIAL STATEMENT.

Western Union Telegraph Company.

NOVEMBER, 1868.

Gross Receipts.....	\$607,728 05
Current Expenses.....	383,024 46
Net Profit.....	\$224,703 59

### Important Changes.

Jesse Hoyt, Esq., for nearly twenty years past identified with the management of the telegraphs in the Province of Nova Scotia, having become deeply engaged in the extensive mining operations of the Acadia Coal Company, of which he is superintendent, has lately resigned his position in telegraph service, to take effect on the first of January, 1869, in order to more fully devote his superior business abilities to the interests of the coal company. He is still a director and member of the Executive Committee of the Nova Scotia Telegraph Company.

In saying adieu to Supt. Hoyt, in his official capacity, we trust we shall not lose sight of him altogether, and that the interest he has ever manifested in the progress of the telegraph will not permit him to forget us nor the business. We hope his recollection of his connection with the "Western Union" will be as pleasant to him as to us. He has risen "from the ranks" by his own exertion and ability, and both deserves and receives great credit from the public and from the telegraph company.

The territory heretofore forming Supt. Hoyt's district, including all the lines and offices of the Western Union Telegraph Company in Nova Scotia, has been assigned to the charge of Supt. Robert T. Clinch, of St. John, N. B. Mr. Clinch will be assisted in Nova Scotia by Mr. Alexander E. Hoyt, who has long held the position of assistant superintendent under his brother's direction. That portion of Mr. Clinch's former district lying in the State of Maine has been added to the third district, under Supt. Bedlow, and the White Mountain lines and the offices at Concord and Manchester, N. H., heretofore under Mr. Bedlow's supervision, have been assigned to the care of Supt. Gates of the fourth district.

For convenience of reference, the three districts bearing a name, are now given a number, and in order to avoid a change in the number of those already well known by their numbers, the Metropolitan District is designated 1st, and the present 1st and 2d the 2d district; the Erie Railway District the 9th, and the Baltimore and Ohio Railway District the 10th.

These changes more nearly equalize the extent of the several districts in the Eastern Division, and bring the territory under the supervision of the superintendents to whom it is most accessible. We trust it will prove a desirable change to all.

Mr. Albert B. Chandler has been officially designated as Secretary of the Eastern Division, and is authorized to act in an official capacity, under the direction of the General Superintendent, his especial charge being the accounts, records and correspondence of the Division. These duties have long been performed by Mr. Chandler, and for which he is fully qualified by long experience, by an intimate knowledge of the condition of the entire division, and by those qualities of patient perseverance, kindness of heart and clearness of head, for the possession of which he is so well known.

DECEMBER 29, 1868.

The operators of Portland, Me., office wish to express thanks for the Christmas gift from their Superintendent, J. S. Bedlow, of a year's subscription to the JOURNAL OF THE TELEGRAPH—a most acceptable present and valued by each and all of us.

PORTLAND.

### Died.

On Sunday, December 27, Ellen, infant daughter of Edward A. and Ellen M. Calahan, aged 6 months and 6 days.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
JANUARY 1, 1899.

## To all Offices on W. U. Lines:

The following changes have occurred since December 15, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Alpsville, Pa., tariff same as Shaners, Pa.  
Atlantic, Iowa, tariff same as West Side, Iowa.  
Brighton Sta., O., tariff same as Cincinnati, O.  
Brandon, Miss., tariff from Louisville 1.60, from Washington 3.25.  
Crawford, N. J., tariff same as Elizabeth, N. J.  
Dennysville, Me., tariff same as Pembroke, Me.  
Freemansburg, Pa., re-opened, tariff same as Bethlehem, Pa.  
Germantown, Tenn., tariff same as Colliersville, Tenn.  
Hamburg, Iowa, tariff 30c. more than St. Joseph, Mo., from offices South and East thereof, and 30c. less than St. Joseph from offices North and West.  
Memramcook, N. B., tariff same as Dorchester, N. B.  
Missouri City, Mo., tariff same as Camden, Mo.  
Nerepis, N. B., tariff 20c. more than St. John, N. B.  
New Philadelphia, Ill., tariff same as Bushnell, Ill.  
Norwich, O., tariff same as Concord, O.  
Phillips, Mo., tariff 25c. more than St. Joseph, Mo., from offices South and East, and 25c. less than St. Joseph from offices North and West.  
Painsec Junction, N. B., tariff same as Dorchester, N. B.  
Saugatuck, Conn., tariff same as Westport, Conn.  
Schuylerville, N. Y., tariff same as Cambridge, N. Y.  
Willesley, Mass., tariff same as Natick, Mass.

Tyrone, Pa., will hereafter be checked direct. Tariff for all offices on line of Pennsylvania R. R. will remain unchanged. Other offices will add 50c. to rate to Harrisburgh or Pittsburgh. Offices having "special rate" to Harrisburgh or Pittsburgh will use it in computing tariff to Tyrone.

Bellefonte, Pa., will hereafter be checked direct. Tariff for offices on Penna. R. R. will remain unchanged. Offices between Erie and Scranton on Philadelphia and Erie and Lackawanna, and Bloomsburg Railroads, will add 40 cents to their rate to Lock Haven, Pa. All other offices will add 50 cents to their rate to Harrisburgh or Pittsburgh. "Special rate" to Harrisburgh or Pittsburgh, if there is any, will be used in computing tariff for Bellefonte.

Cream Ridge, Merchantville, Moorestown, New Egypt, Pemberton, Sharon and Wrightstown, N. J., will hereafter be checked direct. Tariff same as Bordentown, N. J.

The following offices on the Kansas branch of the Hannibal and St. Joseph R. R. will hereafter be checked direct:

Tariff from offices heretofore known as Caton offices, will be according to the "Map Tariff." Other offices will add the rates here given to their tariff to Kansas City, Mo.:  
Liberty, Mo., 40 Holt, Mo., 50  
Kearney, Mo., 45 Lathrop, Mo., 55

## OTHER LINES.

Downingtown, Pa., will hereafter be treated as an "Other Line" office. Tariff 30c. from Philadelphia, 40c. from Harrisburgh, or 70c. from Pittsburgh.

## OFFICES CLOSED.

North Vineland, N. J. Business will hereafter be mailed at Vineland, N. J.; Washington, Wayne Co., Ind., Geddes, N. Y., Marcellus, N. Y., Selma, N. C.

## TO OFFICES HAVING "SPECIAL SHEET A."

Check Brownsville, Tex., at the same rate as to Memphis, Tenn., or 1.00 added to "special rate" to Louisville, Ky.

Offices on line from Buffalo to Rochester, including Rochester, will check Detroit and Monroe, Mich., at 95 cents. From Rochester to Syracuse, including Syracuse, at 1.05. From Syracuse to Albany and Troy, including Albany and Troy, at 1.15. All other offices East, South and North of Albany, in New York State, at 1.25. Offices on line from Pittsburgh to Harrisburgh, including Harrisburgh, at 1.25. From Harrisburgh to Philadelphia, including Philadelphia, at 1.40. Baltimore, Md., and Washington, D. C., at 1.50. Other offices sending business for Monroe and Detroit, via Philadelphia, will add 1.40 to their "special rate" to Philadelphia for tariff to Monroe and Detroit. Offices in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, check Monroe at same rate as Detroit.

## GENERAL INFORMATION.

The rate to East Liberty, Pa., will hereafter be the same as to Pittsburgh. Offices having "special rate" to Pittsburgh will adopt it as rate to East Liberty.

Reductions have been made in the India and China rates, as follows:

From London, England, to	
India, . . . . .	\$14.25
Ceylon, . . . . .	15.25
China (Post Galle), . . . . .	15.50

The name of Pittstown, N. J., office has been changed to Elmer, N. J., and Cottage Hill, Ill., to Elmhurst, Ill.

The following is a list of offices of the Montreal Telegraph Company with tariff from Western Union connecting points. The rate to be taken will be that from the point by which the business has heretofore been sent, the route for the business remaining unchanged:

**L. G. TILLOTSON & Co.,**

11 DEY STREET, NEW YORK.

MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS

AND

MATERIALS OF EVERY DESCRIPTION.

General Agents for the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

The Compound Wire has now stood every test to which it can be subjected. Over twelve hundred miles of it are now in operation with the most satisfactory results.

General Agents for the Bishop Gutta Percha Co.'s

TELEGRAPH CABLES,

GUTTA PERCHA AND OTHER INSULATED WIRES.

General Agents for

PURE NITRIC AND SULPHURIC ACIDS,

Manufactured by the Lodi Chemical Works.

Importers of the best manufacture of

ENGLISH GALVANIZED WIRE.

Publishers of Prof. J. E. Smith's

MANUAL OF TELEGRAPHY.

GROVE,

CARBON,

HILL'S,

DANIELL'S,

And every description of

BATTERY ALWAYS ON HAND.

**DR. L. BRADLEY,**

No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Aetiz*, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

**BLISS, TILLOTSON & CO.,**

**THE BROOKS**

PATENT PARAFFINE INSULATOR WORKS,

No. 22 SOUTH TWENTY-FIRST STREET.

PHILADELPHIA

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

## JEPHTHA H. WADE, ESQ.

Jeptha H. Wade, whose likeness illustrates this page, was born in Seneca County, N. Y., August 11, 1811. His early life was passed in mechanical pursuits, in which he was fairly successful, but for several years immediately succeeding 1835, devoted himself to portrait painting, for which branch of art he had a very decided natural aptitude. It is noteworthy that he took, while thus engaged, the first *daguerreotype* ever taken west of New York, he having procured a camera and studied out the process, unaided except by the vague printed directions accompanying the instrument. Mr. Wade was engaged in his work as a portrait painter when telegraphing originated in the building of the Baltimore and Washington line in 1844. He early identified himself with the new science and built the first line west of Buffalo—that upon the Michigan Central Railroad, from Detroit to Jackson, Mich.—and opened the Jackson office without assistance or instruction. Here he remained for some time as operator. The year 1848 found him in charge of the Erie and Michigan office at Milan, Ohio, where, a fortunate conflagration disposing summarily of his color tubes and brushes, he decided thenceforth to abandon art and devote himself entirely to telegraphy.

The writer's first personal acquaintance with Mr. Wade was in 1850, at which time he (Mr. Wade) was engaged in superintending the line which he had just completed between Cleveland and Cincinnati, bravely bearing arms against the "sea of troubles" resulting from defective insulation, and all the "thousand ills" that infant and experimental telegraphing was heir to. It was a hard fight against ignorance, prejudice, and the cupidity of those who could see no reason why the enterprise in which their money was embarked should fail to pay royal revenues at once. But he won it, and the writer's recollection is clear, that in the stormy season of the succeeding year the "Wade line" was the only clear working circuit in the old office at Apollo Hall. From this time forward, Mr. Wade's success as a telegrapher never varied. The "House consolidation," which placed the Wade line and Mr. Wade's and Col. Speed's interests in the Erie and Michigan lines in the hands of the Mississippi Valley Printing Telegraph Company, and formed the nucleus of the present organization, was speedily followed by the complete absorption of the Erie and Michigan, and the Western Union Telegraph Company stood complete. One of the principal originators of the first Pacific telegraph, Mr. Wade was made its first President, and held that position until the Company was in its turn absorbed by the Western Union. The building of this line was an enterprise requiring, in no ordinary degree, the characteristics so marked in the subject of this sketch—energy, foresight, judgment, determination. Through a country bristling with difficulties that might well

have appalled him, it was left solely with himself to determine how, where and when, if at all, a line should be built to connect Chicago and San Francisco. These questions he decided upon his own responsibility; and the result was a success as brilliant, telegraphically and financially, as the most zealous could have desired, or the most sanguine predicted.

No person, not thoroughly conversant with telegraphing in its infancy, can understand the reluctance with which capital was applied to the building of lines, or the difficulties which were encountered in placing them on a paying basis. Ill-judged competition, resulting in a ruinous division of business, expenses in the maintenance of separate systems of lines, and a lack of public confidence in a system as yet but im-

perfectly organized—these were among the causes that kept many of the lines unproductive, and drove many to bankruptcy. Mr. Wade was too prudent to allow the lines under his charge to become involved beyond their ability to pay, and he was among the first to perceive the causes that had militated against the success of the telegraph, as a business, and to see and apply the remedy—consolidation. One of his most prominent acts in bringing about this result was a trip to California in 1860-61, which resulted, through his rare diplomatic tact and judgment, in a complete adjustment of all conflicting telegraphic interests in that State, and the advancement of the influence of the Western Union Telegraph Company to a pre-eminent position on the Pacific coast. Consolidation perfected,

and nearly all the lines on the continent being parts of the Western Union Company, Mr. Wade became its President, in which capacity he served several years, finally declining a re-election, in order to devote the remainder of his days to his private business, and the care and enjoyment of the ample fortune so deservedly won by his industry, integrity and great business capacity. Though no longer in the active management of the telegraph, Mr. Wade remains a Director in the Western Union Telegraph Company. He is far from being an idle man, his early habits of industry remaining intact, and the care of his private fortune giving him ample employment. He is heavily interested in several of the most extensive manufactories of the country, where his clear head and accu-

rate judgment are highly valued; is a director in three or four railroads; and active in the management of three of the largest banks in Cleveland, of one of which he is President. The following complimentary resolution was passed by the Board of Directors upon Mr. Wade's retirement from the Presidency of the Western Union Telegraph Company.

At a meeting of the Board of Directors of the Western Union Telegraph Company, held in the City of New York July 18, 1867, a letter was read from J. H. Wade, declining a re-election to the office of President, whereupon it was unanimously

*Resolved*, That in receiving the letter of J. H. Wade, Esq., declining re-election to the Presidency of this Company, we cannot pass it to the official files without recording our testimony to the distinguished service he has rendered to the general system of American Telegraphs, and especially to the Company whose management he now resigns.

Connecting himself with it in its earliest introduction to public use, and interesting himself in its construction, he was the first to see that the ultimate triumph of the telegraph, both as a grand system of public utility and of secure investment, would be by some absorbing process which would prevent the embarrassments of separate organizations.

To the foresight, perseverance and tact of Mr. Wade we believe is largely due the fact of the existence of one great Company to-day with its thousand arms, grasping the extremities of the Continent, instead of a series of weak, unreliable lines, unsuited to public wants, and, as property, precarious and insecure.

*Resolved*, That we tender to Mr. Wade our congratulations on the great fruition of his work, signalized and cemented by this day's election of a Board representing the now united leading telegraph interests of the nation, accompanied with regrets that he is not with us to receive our personal acknowledgments, and to join us in the election of a successor to the position he has so usefully filled.

Office of the Western Union Telegraph Company, New York, July 10th, 1867.

WILLIAM ORTON, President.

O. H. PALMER, Secretary.

Mr. Wade is now 57 years old. Time has dealt gently with him. His physical condition is perfect—"his eye is not dimmed nor his natural fire abated." His rare judgment is unclouded, and the tact and kindness which in the past endeared him to those with whom he was associated, remain unchanged. A man of many strongly-marked characteristics, one of the most salient points in his character is a certain

rugged fidelity to those who were his friends in early life; and no man claims his friendship or sympathy, "for auld lang syne," in vain. The zest with which he enjoys a joke is traditional among the craft, and his friends "save up" their best stories "for Mr. Wade," sure of that best reward to a raconteur—apt appreciation and a hearty laugh. M.

### The Government and the Telegraph.

At the recent banquet given to Prof. Morse, reference was very properly made by at least one of the speakers to the proposition which has been advanced in some quarters to place the telegraph under the control of the Government. It was stated, furthermore, that the only bill pending before Congress providing for such control did not contemplate acquiring the present system of lines, but proposed to commence the construction of new lines by putting up one of four wires between this city and Washington. This is the plan of which Hon. Mr. Washburne is the father, and for the purpose of collecting information for its development he is understood to have made a special trip to Europe a year ago. We would be glad to have him inform us in what European country he found the precedent for his scheme to appropriate the public money to enable the Government to embark in a competition with its own citizens.

It was certainly not in England, for although the British Government has decided to make the telegraph a department of the postal service, its first movement in that direction was to open negotiations for the purchase of all the existing lines. The result of these negotiations is an agreement to sell to the Government for a sum equal to twenty times the net profits of the present year, such profits to be ascertained by Commissioners appointed for that purpose.

This appears to be a liberal arrangement toward the telegraph owners, and one which our companies would undoubtedly be willing to accept; and yet it is no more than any Government should be ready to give in consideration of the perpetual surrender by its citizens of their right to profit by investments in a business which is destined to become of such immense importance as the telegraph. But we are opposed to the assumption of private enterprises by our Government on any terms. There can be nothing pleaded in justification, unless it be public necessity. In the case of the telegraph no such necessity exists. Certainly there is no lack of facilities between this city and the national capital. On this route three rival companies have been operating competing lines for several years, and a fourth is now erecting another set. Either possesses facilities equal to those proposed in the Washburne bill, and one of them vastly greater. Nor are the charges on this route excessive. Two of the companies have thus far been unable to make any dividends, and the ability of the third to do so, at low rates, cannot have been materially assisted by the profits on the business between these points.

Mr. Washburne proposes to make the tariff on his line fifteen cents for ten words, instead of forty cents, the rate now charged. Is the mere difference of twenty-five cents per message in favor of those having occasion to use the telegraph between these points a consideration of such importance as to justify the Government in expending a large sum directly, and, perhaps, indirectly destroying existing property which cost vastly more? But he will probably answer, this is to be an experiment to test the practicability of operating the telegraph by the Government at low rates. Then why not try the experiment where the results will prove something? Men of largest experience in the management of the telegraph claim that their business is mainly dependent on trade and commerce, and that merely personal and social communications constitute but a small item in the aggregate number of messages; that a small manufacturing town will give greater returns than another of much larger population but less enterprising in trade. An experiment to

test the correctness of these opinions might claim consideration if it were to be instituted between places to which private enterprise denied the telegraph, on the ground that it could not be made to pay. But we are inclined to coincide in the above opinion, and to believe that the lines under private control will everywhere follow closely the demands of business at all points which promise even moderate profits. We believe, however, that the companies will find it for their interest to offer the public lower average rates; first, because the business will thereby increase more rapidly, and, secondly, because the operation of competing lines, which will be constructed to meet the demand for lower rates, will, by dividing their receipts, diminish their profits more than would probably result from liberal reductions in advance of competition. —N. Y. Times.

### Foreign Telegraph Prices.

The price of transmission between Russia and Denmark, for a simple dispatch of twenty (20) words, is fixed at 8½ francs, of which 5 francs belongs to Russia, for the transmission across the Empire (excepting Caucasus), and 3½ francs to the company for the transmission by the cable and to the Danish Telegraphs.

The transmission of a dispatch between Russia and London costs 12 francs, and 13 for other parts of Great Britain. The basis of the calculations remains always the same: 5 francs for Russia and 3½ francs for the transmission by cable and Denmark. The Russian Government allows a subsidy of 1 franc for each dispatch transmitted by the cable, with the exception of Government and Administrative dispatches. The dispatches for Great Britain in the same manner, London excepted. This last exception will continue as long as England maintains at home a different tariff for the transmission of dispatches into the interior.

The grant is made for 30 years, and the Russian Government engages, on its part, not to grant, during this lapse of time, a single concession for a direct submarine communication between Russia and Denmark. After the expiration of this term the monopoly and subsidy ceases; but the company preserve the right of continuing to work their line by conforming themselves to the actual concession.

This subsidy will not in any case exceed the sum of 40,000 francs annually. When the number of dispatches transmitted amounts to 100,000 dispatches, the subsidy will cease to be paid. But the company will again receive it in the before-mentioned proportion, if, by unforeseen circumstances, the number of annual dispatches is reduced below 100,000.

### Domestic Telegraphy.

Sir William Clayton, Bart., England, has just completed a system of telegraphy over his estate at Harleyford, near Great Marlow, Bucks, which enables him to communicate most comfortably from his study with his bailiff, coachman, gardener, gamekeeper and the several lodge keepers. The instruments are Messrs. Siemens's Magnetic Dial Telegraphs, and the communication is established by the copper-sheathed cables of the same firm, laid underground by the aid of a plough. A "tell-tale" at the study indicates by "drops" the calling stations, and by an arrangement of switches Sir William is enabled to put his instrument in circuit with either of the calling lines, or himself call into either of them. There are, at present, six separate circuits, forming three miles of lines, and an extension to other parts of the property is shortly intended. On the roof of the house, Sir William has also erected an anemometer which registers in his study. Both arrangements are of the most complete character and of the most improved construction.

THE agent of one of the Lowell manufacturing companies has had a telegraph wire stretched from his bedroom to the mills, that he may be notified at any hour of the night of fire or other calamity there.

## Correspondence.

CLEVELAND, Dec. 21, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

If it is a fact that the conductivity of copper wire in our relays decrease on account of the continual passage of either current in one direction, I suppose the company will, on the 1st of January, or such other time as it may select, cause all the main batteries to be reversed—or if not, why not?

Many an old operator has noticed a deterioration in a favorite magnet after several years' acquaintance. This is more marked in some than others, which is not strange, as very different degrees of electrical tension prevail on different circuits. It would cost nothing to change the poles of all main batteries occasionally, and it might prove worth trying.

By the way, the boys in this office have a custom which is not general; and it is a good one. As messages are sent with the right hand, the left times and marks them, which, aside from insuring correct timing to a minute, enables him to quit his desk the moment his relief comes. (This repays the trouble of learning the knack.) Again, his work is always complete, and the marking is much better than when done with the right hand, because the unpractised left bears on very hard.

Don't let this item crowd out anything more interesting on account of priority. Yours, BILIOUS.

### "The Campbells are Coming!"

Here is another letter which brings sunshine to our Christmas table, and to our hearts as well. The turkey was a beauty, weighing 20 lbs., and was as delicious as it looked. J. D. R. is a lucky dog.

CARLISLE, Pa., Dec. 21, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

Enclosed please find a *turkey* for your Christmas dinner; please accept it from one of your old subordinates, in memory of the good old times. It is not as large as I intended sending; but some scamp who had no fear of the Burgess before him stole the one intended to be sent, and this one is only a small specimen of our Cumberland County turkeys. I hope you and yours may enjoy it for your Christmas dinner.

I cannot forget my old and good friends. Cannot you make it suit sometime to get around this way and pay a call on your old friends up this valley? You have many true ones connected with the happy days of the A. and O. line. Wishing you a happy Christmas and a merry New Year, I remain, yours truly, J. CAMPBELL.

### Telegraphs in South Australia.

There are at present 1,113½ miles of telegraph lines open in South Australia, which represent 1,642½ miles of wire. The Australian tariff is considerably less than those generally adopted in England and on the Continent of Europe. The advantages of the system may be understood from the statistical facts that, whereas last year in South Australia the ratio of the number of telegrams sent, to the number of letters transmitted through the post, was 1 to 18, in Belgium there was 1 telegram for every 32 letters, and in England 1 telegram for every 121 letters. In the first mentioned country there were, on an average, 3 telegraphic messages sent for every 4 of the population, while 1 telegram for every 7 in the population in England constituted the ratio there.

It has been proposed that, as in England, the telegraphic and postal systems be blended, and it is suggested that, in order to accomplish this result, the postmasters should remit in postage stamps the cost of the messages forwarded, which could be cashed at the post-office.

The revenue of the year amounted to £12,368 2s. 4d., an increase of £178 over that of the former year. Great inconvenience was experienced from the wilful destruction of insulators.

## THE MORSE BANQUET.

## Letters Received by the Committee of Invitation.

EXECUTIVE MANSION,  
WASHINGTON, D. C., Dec. 26, 1868. }

GENTLEMEN: I have the honor to acknowledge the receipt, and to express my thanks for the courtesy, of the invitation to be present at the banquet to be given to Professor Morse on Tuesday next. I sincerely regret that my engagements are such as to prevent my attendance, for it would afford me pleasure to unite with you in rendering honor to one to whom the age owes so great a debt for untiring devotion to its advancement.

Respectfully yours, ANDREW JOHNSON.

Mr. Cyrus W. Field, } Committee, etc.  
Mr. Wm. Orton, }

DEPARTMENT OF STATE, }  
WASHINGTON, Dec. 21, 1868. }

GENTLEMEN: I give you my thanks for your courteous invitation to the banquet which is to be given by the telegraph builders to the inventor of the electric telegraph. The demonstration is as well conceived by the former as it is well deserved by the latter. I regret that my engagements prevent an acceptance of the invitation. If I could be only partially successful in using the great invention for the purposes of extending commerce, diffusing intelligence, cementing peace, and promoting freedom, friendship and fraternity at home and abroad, I then should feel that I had some right to join in your future celebrations. I am, gentlemen, your obedient servant,

WILLIAM H. SEWARD.

To Messrs. Cyrus W. Field, Wm. Orton, &c., New York.

CLARENDON HOTEL, }  
NEW YORK, December 22. }

DEAR SIR: It would give me great pleasure to be present, if possible, at the banquet to be given to Professor Morse on the 29th instant, to testify my respect for one who has conferred so much honor upon the name of an American citizen, and such great benefits upon the country and the world.

I am compelled, however, to leave for Albany and cannot return in season.

Please express my sincere regrets, and believe me  
Very respectfully, JOHN T. HOFFMAN.  
Cyrus W. Field, Esq.

STATE OF NEW YORK, EXECUTIVE DEPARTMENT, }  
ALBANY, Dec. 28, 1868. }

DEAR SIR: You cannot too greatly honor Prof. Morse, and I regret that the pressing labors incident to the close of my term of office will prevent me from uniting in the rich entertainment which his friends will offer him to-morrow night.

Very respectfully, R. E. FENTON.

Cyrus W. Field, Esq., New York.

FROM GEN. McCLELLAN.

HOBOKEN, December 28, 1868.

GENTLEMEN: I received only this morning the invitation with which you have favored me to be present at the banquet given to Professor Morse.

I regret that it will not be in my power to manifest by attendance the very high respect and esteem in which I hold your honored guest, and with my sincere thanks for the invitation,

I am, most respectfully and sincerely your friend,  
GEO. B. McCLELLAN.

Cyrus W. Field and Wm. Orton, Esqs.

HAMILTON COLLEGE, }  
CLINTON, Dec. 30, 1868. }

MY DEAR SIR: I regret extremely that I had left the city before your kind note of invitation was sent to me at Dr. Chamberlain's. It would have given me a rare pleasure to attend a banquet in honor of Mr. Morse. It was my good fortune to be in Paris with him in 1838, when the value of the invention was hardly recognized, and subsequently, traveling with a friend in the East, to bring the electric telegraph to the notice of scientific gentlemen in Italy, Greece and elsewhere. What results from those painful and discouraging beginnings! And if the inventor be worthy of all honor, hardless less so is he who, amidst discouragements quite as great, and disappointments still more trying, succeeded at last in accomplishing the grandest result in the whole history of similar invention—a re-

sult which makes the stories in the Arabian Nights tame and common place.

With many thanks for your courtesy, my dear sir, I remain very respectfully yours,

S. G. BROWN.

Cyrus W. Field, Esq., New York.

FROM THURLOW WEED, ESQ.

Mr. Weed very much regrets that his health will not permit his acceptance of the invitation to the dinner to be given to Professor Morse, whose scientific discovery, bringing the whole civilized world into instantaneous mental communion, seems more a revelation of Divine than an inspiration of human wisdom.

December 26, 1868.

DEAR SIR: I am too much of an invalid to attend the banquet to Professor Morse.

But I heartily respond to any honor done to my old friend. Very respectfully, your obedient servant,

THOS. S. SULLY.

Cyrus W. Field, Esq.

FROM THE GOVERNOR OF JAMAICA.

CLARENDON HOTEL, 26th December.

SIR: I am very much flattered by your invitation to join the banquet to be given to Professor Morse, LL.D., on Tuesday, but I regret to inform you that I am in bed suffering from a severe inflammatory attack. I am the more sorry at not being able to be with you, as the subject of Telegraphy is of great interest in the Government of Barbadoes, which I have just left, and in the Government of the Bahamas, to which I am proceeding.

I have the honor to be, sir,

Your very faithful servant,

JAS. WALKER.

FROM THE DANISH SECRETARY OF WAR.

WASHINGTON, D. C., December 27, 1868.

MY DEAR MR. FIELD: I have duly received the invitation to the intended banquet to our friend Prof. S. F. B. Morse, which you have had the goodness to address to me.

Nothing could have given me greater pleasure than to join you and the other friends of Prof. Morse on this occasion, when he is, once more, to receive a mark of the great esteem in which he is held at home and abroad; but to my great regret, the state of my health forbids me to undertake the journey to New York, or to incur the excitement, however pleasant, of a public dinner.

Do me the favor, therefore, to accept for yourself and to convey to the other members of the committee of invitation, on whose behalf you have addressed me, my sincere thanks for their kindness and the expression of my great regret at being prevented from availing myself of their much valued invitation.

I have the honor to be, with high regards,

Your obedient servant,

W. RAASLOFF.

Cyrus W. Field, Esq., New York.

UTICA, N. Y., Dec. 28, 1868—Afternoon.

MY DEAR SIR: I have the pleasure to acknowledge your invitation, received but now, to be present to-morrow evening in New York at a banquet to be given to Professor Morse.

With fewer miles or more hours between now and then, it would be hard to forego such a pleasure as you set before me. It would be a high gratification to see honors paid to a guest of so much renown, and by men who have themselves so largely and so usefully illustrated the genius and the enterprise of America.

The occasion should be and will be memorable, and I count it a misfortune to have no voice or part in it.

Accept my thanks and the assurance of my respect.

Your obedient servant, ROSCOE CONKLING.

Cyrus W. Field, Esq.,

POST OFFICE, }  
NEW YORK, Dec. 29, 1868. }

DEAR SIR: I regret to say I will have to deprive myself of the honor of being present and pay my respects, at the dinner to-day, to Professor S. F. B. Morse, the originator of the telegraph, now spreading instant intelligence throughout the world, and one who is so eminently entitled to the thanks of all humanity for the blessings it has conferred.

I am delighted to know all your guests will be such as to do honor to themselves in thus paying this tribute of respect to the man who has done honor to the nineteenth century and especially to our beloved country.

I am, with the highest regard and esteem, respectfully yours,  
JAMES KELLY, P. M.  
Cyrus W. Field, Esq.

NEW YORK, Dec. 29, 1868.

DEAR SIR: I do not feel well enough to be present this evening to join in honors to my friend Professor Morse, as I fully intended to have done, and which I regret very much.

It would have caused me much pleasure to join with his many friends on that occasion in expressions of sincere respect and affection.

Few persons of genius have had more difficulties and discouragements to encounter in prosecution of scientific inventions than our friend, and none have lived to triumph over them all more signally than he, and I am sure no one personally can be more worthy to bear and enjoy such world-wide honors as he has won.

Yours very truly,

RICH'D M. HOE.

Jas. D. Reid, Esq., Secretary.

PRINCETON, N. J., Dec. 24, 1868.

DEAR SIR: I have just received your kind invitation. I cannot express how deeply I feel disappointed in not being able to be present at the banquet. Professor Morse has benefitted the whole civilized world, and all friends of science and of art should combine to do him honor. I am prevented from attending only by a previous engagement. Yours ever,

JAMES MCCOSH.

Cyrus W. Field, Esq.

ROCHESTER, Dec. 21, 1868.

DEAR SIR: I much regret that a business engagement which requires me to be in Indiana at the time appointed will deprive me of the pleasure to take part in the banquet to Professor Morse.

I should consider it a great privilege to aid in the slightest degree in doing honor to one who has contributed so largely as Professor Morse has done toward the success of the great work of binding in iron chains nature's most subtle and powerful element and compelling it to contribute to the wants of mankind.

I hope the Professor will live many years to enjoy the honors he has so deservedly won.

Very respectfully yours, H. R. SELDEN.  
James D. Reid, Esq., Secretary.

HEADQUARTERS ARMY OF THE UNITED STATES, }  
WASHINGTON, D. C., Dec. 21, 1868. }

GENTLEMEN: General Grant directs me to express his thanks for your kind invitation to the banquet about to be given to Professor Morse, as well as the pleasure it would give him to accept it. Circumstances, however, oblige him to decline, though much against his will.

I am, gentlemen, very respectfully, your obedient servant,

ADAM BADEAU,  
Bret. Brig.-Gen. of A. D. C.

Messrs. Cyrus W. Field and Wm. Orton, for Committee of Invitation.

FROM SIR CHARLES BRIGHT.

ON BOARD STEAMER NEW ENGLAND, }  
OFF SANDY HOOK, Dec. 21, 1868. }

MY DEAR SIR: The invitation which you have so kindly sent me to be present at the banquet to be given to Professor Morse has reached me at a most untoward time, for I am on the point of leaving for the South upon a matter of so much moment that I am unable to change my plans (as I should have done in the case of any business affecting myself only) in order to enjoy the great gratification of once more evincing the deep feeling of respect and regard which I entertain, in common with all who are connected with telegraphs in Europe, toward your illustrious fellow-countryman. To me, who have had the privilege of personal friendship with Professor Morse since the time of our experiments together in reference to the Atlantic cable in 1856, the disappointment of being compelled to deny myself the pleasure of being with you on such a notable occasion is greater than it can be to others who have known him only by the inventions which have left his name so deeply marked in the records of scientific discovery.

Will you do me the favor of expressing my sincere respects to the Professor, and believe me to be,

Very faithfully yours, CHARLES T. BRIGHT.  
Cyrus W. Field, Esq., New York.

**Extracts from the Remarks of Geo. H. Thurston, in National Board of Trade, Cincinnati, December 2, 1868, on the Absorption by the Government of the Telegraph Lines.**

In the encroachment of the Government upon the avenues for the employment of private capital and private enterprise, we are following the lead of monarchies. In England the Government has lately monopolized the telegraph by the purchase of all the telegraph lines in Great Britain. And upon these terms: The price paid is, first, twenty years' purchase of the net profits of the Companies, based upon the profits of each Company for the year previous to the purchase. Secondly, payment for the estimated aggregate value of their capital. Thirdly, compensation for the loss of the prospective profits of the Company on its ordinary shares. Fourthly, each and every officer and clerk who has been five years in the service of the Telegraph Company, will, if he has no offer of appointment from the Postmaster General of equal value to that held by him under the Companies, receive during his life an annuity, graduated according to the number of years he has been in the telegraph service, but equal to two-thirds of his previous emoluments.

I feel free to say that as a stockholder and as an officer representing a body of stockholders, that any absorption by the United States Government of the telegraphic lines of this country under a recompense one-fourth as liberal, ought to on purely selfish grounds meet my support: but, sir, as a tax payer, as a commercial man, as a good citizen, and as one who would see the patronage of the Government decreased instead of enlarged, I view the proposition with apprehension, and oppose it from principle.

I believe there is in this plan the setting of a dangerous precedent, tending to sanctioning the absorption by the Government of many of those avenues in which personal enterprise and private capital now find employment. It seems to me it is in opposition to the very spirit of a Republican Government. Such a government appears to me to be solely for the protection of the liberty, the life and the property of its creators, and it was never contemplated it should come in competition with the enterprises of those who formed it. With the guarantee of free speech, and a free press, under such a form of rule, went hand in hand a guarantee of the widest field for the exercise of private enterprise, the employment of private capital, to the building up of competition in all branches of business.

It has been said that already the telegraph is encroaching upon the revenues of the Post Office Department, inasmuch as it is transmitting letters which would otherwise go by mail. Is not this then indicative that the very end is being reached by private enterprise which it is claimed the Government must step into possession of the telegraph lines to bring about? Great as have been the reductions in the rates of postage, it is to attempts made through individual enterprise to lessen the cost and shorten the time for the transmission of letters, that cheap postage is in some measure due. Whether the postal service of the country would not be as well, if not better performed, by private enterprise is even now a mooted question. And in view of the postal deficiency of the last year, there would seem to be great propriety in leaving unquestioned to competitions the cheapening of the transmission of telegraph messages, until at least the postal department maintains itself beyond doubt.

It has been charged that the deficiencies in the post office revenues are the results of iniquitous contracts. Be that as it may, are there any who claim that the introduction of the telegraph service into the departments of the Government is going to make all men honest? I cannot but look upon the incorporation of the telegraph with the postal service as creating so many more possible sources to breed corruption, if the charges we hear daily made are true.

The precedent is altogether a dangerous one. Already in England, since the purchase of the telegraph lines, has arisen, and is urged, a plan for the purchase of all the railroads of that country. Would not the absorption of the telegraph lines by this Government lead to the same cry here? And if the Government shall, on the cry of any great or small body of its citizens that certain facilities or luxuries cost the public more under private enterprise than the same could be furnished by the Government, proceed to act as is proposed in telegraphs, what may it not monopolize?

The plea of the cry for the Government to do the tele-

graphing of the country, is that the people should have telegraphing cheaper. Now, sir, who are the people who use the telegraph? Why, sir, nine-tenths of all messages are sent by merchants, manufacturers, bankers and speculators, who use the telegraph because they can make transactions quicker and more profitably than they can by using the mail. It is a mere matter of dollars and cents. If then there is an over taxation for the use of the wires, where does it fall but in the right place? on those almost exclusively who use the wires because it is profitable so to do, and who would not to any extent were it otherwise. Why then should the Government rush into an experiment, at a probable loss yearly, to the increase of the taxation of the great mass of the people?

While I would be the last to utter a word that might prevent the Government from aiding in every way the increase of business in this country, and augmenting the facilities for its transaction, yet from my knowledge of the class between whom telegraphic messages chiefly pass, it would seem to me that any act absorbing into the postal department the telegraph lines, would be legislating for the benefit of a few, to the almost certain risk of taxing the many. And further, if monopolized by the Government, I fear the very class who would expect to be most benefitted would find the telegraph robbed of all that celerity, secrecy and reliability which now renders it valuable to business men.

The Government cannot be sued for loss resulting from the delay in the transmission of a letter, and it is not to be presumed that one could do so in case of loss resulting from delay in delivery or error in transmission of a telegraphic message. Yet for such delay or error telegraph corporations can be sued and recovery made, if the case is proven.

All know the liability of wires to get out of order, to break, to become entangled, and in other ways rendered useless for a time. While the telegraph service of the country is in the hands of competing companies there is every inducement to their officers to shorten the time of all such interruptions. Prestige, business, dividends, all depend upon uninterrupted lines. But monopolized in the hands of Government employees, who will doubt, who knows anything of delays in the postal service, that the repairs of interruptions would be, to say the least, a much slower operation than it is under the spur of competition.

It would appear then that the reliability, from inability to sue for damages, would be gone. It would also place a dangerous opportunity in the hands of ambitious, corrupt or designing men, who might belong to the governing power, to perpetuate their rule or politically destroy their opponents. The very class who might expect to be benefitted, would in the end find themselves crippled in the very facilities they who cry for the government telegraph expect to increase.

Supposing the government telegraph retains all the celerity, secrecy and reliability of corporate telegraphs, wherein is the service to be bettered? There is no evidence in any branch that the Government employs any better men than corporations to do the work. On the contrary, is it not notorious that political influence causes the appointment of very inferior men? On the reverse, the object of corporations being to make money, the best men are chosen.

The bill before Congress proposes to charter the United States Postal Telegraph Company, naming several persons as the incorporators, for the purpose of constructing lines of telegraph and operating them, and maintaining them upon the post roads and routes of the United States. It provides for its capital stock and in every way creates a telegraph corporation. The same bill then goes on to authorize the Postmaster-General to establish a postal telegraph system, and specifies that the Postmaster shall receive bids from companies for the transmission of messages; and specifies the rates for messages of twenty words or figures, or less, shall not exceed twenty cents, and five cents for each additional five words or figures, for every five hundred miles or less of transmission. It also provides that messages may have priority over others by the payment of extra rates. The bill finally provides that if the United States Postal Telegraph Company, whose incorporation is so shrewdly interwoven with powers and instructions for the Postmaster-General, shall refuse or neglect to contract with the Postmaster-General to carry messages at the rates proposed in the bill, its incorporation then shall become void.

Is it in any way necessary to inquire why the incorporation of a telegraph company is so cunningly interwoven with this authority to the Postmaster-General to join the sending of telegraphs with the carrying of letters in his

department? Why should the rates be fixed and the life of the corporation hinged upon its contracting at such rates? The more especially may the question be asked, when in a pamphlet urging upon Government the sending of messages, published by Gardiner B. Hubbard, one of the incorporators named in the bill, it is said: "It is not claimed that either the Western Union or any other company, or even the Government itself, could transmit messages through the country at the rates proposed in the bill without loss." Is there not room for suspicion that the projectors of the United States Postal Telegraph prefixed the rates at losing figures that they might be the only contractors bidding? Is it not equally clear that under the contract they would have a monopoly?

If it is in real good faith contemplated that the Government should, to benefit the public, control the telegraph business, why, in creating the necessary legislation to enable the Postmaster-General to assume those duties, create in such a manner that is it hard to say what is Postal Telegraph Company and what Postmaster-General, a corporation to stand between the people and the Government. A sort of middle man, who by first contracting at exceedingly losing rates obtains the monopoly of the transmission of messages, and by so doing smothers out all competition; and then is at liberty, according to the bill, to break the contract by forfeiting the trifling sum of thirty thousand dollars! A cheap price for a monopoly! Or, if not choosing so to do, can charge such extra rates by the bill as they may choose for messages requiring immediate dispatch, as if most messages by telegraph did not require immediate dispatch, or else why use the wires! and as if in a short time the great majority of messages would not from necessity or priority be costing extra rates. Is it necessary to dwell on the corruption possible under such a plan. To the avoidance of this it may be urged that the Government should buy all the lines. This would contemplate the expenditure of thirty or forty millions of money and consequent taxation for its interest, to say nothing of the establishment of a host of fresh Government officers, and the creation of a swarm of political office holders, not to mention the probability, taking the postal service as a criterion, of future taxations for deficiencies; while to the extension of the lines into all remote as well as more settled districts to suit the demands of party and politicians there would be no end.

It would seem to me that the whole aspect of the question as to the incorporation by the Government of the telegraph with the postal service of the nation is most unfortunate. The tendency of such a movement would seem to be to lessen its value, to increase the Government patronage, to create expenditures of money or increase of debt and consequent taxation therefor, and threaten taxation to supply deficiencies if the lines are purchased by the Government, and if placed upon the contract system to eventuate in the suppression of competition and the establishment through the influence of Government of a monopoly.

The sole good proposed to be gained is a cheapening of the cost of telegraphing throughout the United States, because in a few closely populated and small counties in Europe, telegraphing appears to be cheaper than in this country. Is it really cheaper? It must not be overlooked that the distances in the United States are greater between populous towns than in Europe, and that the country save in a few sections is more sparsely populated. The area of Belgium is only about one-fourth the State of New York, and its greatest length 175 miles, while three-fourths of its population live within fifty miles of Brussels, and of the four largest cities Antwerp is reached by rail in thirty minutes. In what section of our country is population so condensed? There the rate is ten cents for an average distance of seventy-five miles for an average message. From Pittsburgh to Baltimore and to Philadelphia, a distance of about three hundred and fifty miles for each point, the rate is only 30 cents, or about  $7\frac{1}{2}$  cents for each seventy-five miles of transmission, while after night twice the number of words can be sent for the same price. Between New York and Pittsburgh, a distance of about five hundred miles as the wires run, the rates are forty-five cents, or  $6\frac{1}{2}$  cents for each seventy-five miles of transmission. Between Louisville and New York the rates are one dollar, and the distance by wire is 975 miles, or about  $7\frac{1}{2}$  cents for each seventy miles. These rates have been established not only where the distances are four, five and ten times greater than the average distance of transmission in Europe, but where the population is on many routes very sparse in comparison with the dense population of Belgium, in which nation the rates for telegraphing are the smallest in sum. The rates of England and

Switzerland and France, when compared in the same manner with established companies in this country, show the same results.

It must also not be forgotten in the comparison that the cost of the skilled labor, and in fact all labor in the United States, employed on the telegraph lines, far exceeds that of England, and yet the rate for transmission has been reduced to a lower rate per mile than in Europe, under all the disadvantage of high rate of wages, long distances and sparser ratio of population. Self-interest is fast developing not only the increase of lines, but greater facilities and still lower rates. What profit then is there in giving ear to the few who, illy understanding the subject, cry that the Government should absorb the telegraph business on the plea that it will cheapen rates to the standard of Europe? That is already done or being done, without risk of expenditure of money by the Government, liability therefrom of taxation to the people, or danger of increase of the Government patronage and its attendant evils.

I think all who will dispassionately consider the subject will come to think with myself, that the further cheapening of telegraphic charges had better be left to the same power which has tunneled our mountains, constructed our railroads, opened our mines, built up our manufactures, the power of competition, driven by the impatience, the energy, and the brain of the American people.

#### Presentation.

Mr. G. A. Kraft, who for the last eleven years has been engaged in the telegraph service, having now retired from it, his fellow-operators have presented him with a beautiful gold-headed cane as an evidence of their friendship and esteem.

#### CORRESPONDENCE.

To G. A. Kraft, Esq., office W. U. Telegraph Co., Twenty-seventh street and Fourth avenue, N. Y.:

DEAR SIR—We, the undersigned, operators on No. 6, while regretting the cause which prompts your withdrawal from among us, would in a fitting manner recognize your claim to our friendship and esteem, a regard which your obliging nature, genial disposition, and social qualities have firmly established.

Accept with this token of our friendship our best wishes for your future welfare and prosperity in whatever business you may engage.

P. J. Hobart,	F. Wheaton,	J. R. Butler,
J. Batterson,	A. E. Sturges,	T. Hynes,
S. B. Curtis,	M. H. S. Jackson,	T. H. Weeks,
G. E. Pardee,	D. H. Sternberge,	G. W. Harris,
G. P. Sim,	G. Benedict,	M. P. Conway,
	Jno. Brampton.	

#### MR. KRAFT'S RESPONSE.

MY FRIENDS—I tender my sincere thanks to you all, regretting that I cannot see and thank each of you in person. Wishing you all success and happiness, I bid you farewell.

G. A. KRAFT.

#### The Chinese Woman's Telegraph.

During the recent visit here of the Chinese Ambassadors, one of them stated in reply to the inquiries of a physician, that it was not customary in China, except among the lower classes of the people, for the doctor to see or touch female patients. In order to ascertain the pulse of the sick woman, a string is tied around her wrist and is extended outside the window to the doctor, who holds the string between thumb and finger, and by this form of telegraph is enabled to count the pulsations. This seems a ludicrous plan; but it is far less mischievous than our custom of admitting men doctors to the private apartments of females. The opportunities for the medical education of women in this country are greatly increasing; and we hope the day is not far distant when the women will be able to rout the men from the sick room, and compel them to stand out in the cold, under the window sill. In China, only women nurses attend in child-birth.—*Scientific American.*

WE have received from Mr. J. D. Wheat, of St. John's Run, West Virginia, a description of a Self-closing Key, but it is exactly the plan advertised by Mr. J. B. Frey, and contains no new features to require notice.

#### Telegraph Salaries in France.

In a letter addressed last month to the *Journal la Gironde*, in response to an article a little ambiguous which appeared under the title of "*les Telegraphes a bon marche*," an employee of Bordeaux makes the following complaint:

"Another cause of delay of '*le bon marche*,' is the lack of operators, but you will not be surprised that so few young people are adopting the telegraph profession, when you know that after serving twenty years for the salary of 1400 francs, equal to about \$200, they then hope to receive 2400 francs, or about \$350 in their old age. In order to be just I should add that in the more important offices, where there is night service, extra pay is given at the rate of 50 centimes or half a franc per hour. The situation of the messenger being still more miserable it is equally difficult to procure them. This is the system which Mr. Washburne and Mr. Hubbard, of Boston, so much admire, and would foist on the American people, a government service made cheap by the employment of an inadequately remunerated service.

#### China.

There is a special agency established at Pekin, China, for the purpose of sending Russian-Chinese dispatches; this agency should have the effect of conquering the prejudice of the Chinese Government in regard to the telegraph. Until the present this government has sent its news, to distant provinces, by means of fires.

The transmission, by this means, of the news of Grand Tartary, continued 6 days. The Russian dispatches are still sent by mail, from the frontiers to Pekin. Various cities of China have been for a long time united together by telegraph wires.

#### The Gentleman.

I have stated that the forbearing use of power is a rare attribute of the gentleman; indeed, we may say that power—physical, moral, purely social or political—is one of the touchstones of genuine gentlemanship. The power of the father over his children, and the old over the young, and the young over the aged; the officer over his men, the master of a vessel over his hands, the magistrate over the citizens, the employer over the employed, the rich over the poor, the educated over the unlettered, the experienced over the confiding, the keeper of a secret over him whom it touches, the gifted over an ordinary man, even the clever over the silly—the forbearing and inoffensive use of all this power or authority, or a total abstinence from it where the case admits it, will show the gentleman in a plain light. Every traveler knows at once whether a gentlemanly or rude officer is searching his trunk. But the use of power does not only form a touchstone; even the manner in which an individual enjoys certain advantages over the others is a test. No gentleman can boast of the delights of superior health in the presence of a languid patient, or speak of great good luck when in hearing of a man bent by habitual misfortune. Let the man who happily enjoys the advantages of a pure and honest life, speak of it to a fallen fellow-being, and you will soon see whether he be, in addition to his honesty, a gentleman or not. The gentleman does not needlessly and unceasingly remind an offender of a wrong he may have committed against him. He can not only forgive, he can forget; and he strives for that nobleness of soul and manliness of character which impart sufficient strength to let the past be truly the past. He will never use the power which the knowledge of an offense, a false step, or an unfortunate exposure of weakness, gives him, merely to enjoy the power of humiliating his neighbor.—*Dr. Lieber.*

#### SHAWK & BARTON,

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES,

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.,	&c.	&c.

We continue to manufacture Instruments after the favorite

#### WESTERN UNION STANDARD PATTERNS,

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

#### COMPLETE OUTFIT OF ELECTRICAL APPARATUS,

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

#### TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

NO. 93 ST. CLAIR STREET, CLEVELAND, O.

G. W. SHAWK,

E. M. BARTON.

#### OFFICE OF THE

BISHOP GUTTA PERCHA COMPANY,

113 LIBERTY STREET,

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1883.

General Agent.

#### STICKWELL & CO'S

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JANUARY 15, 1868.

### Mr. Thurston's Address.

On page 40 will be found an address delivered by Mr. Geo. H. Thurston, before the National Board of Trade, Cincinnati, Dec. 2, which we commend to the reader for the force of its reasoning, the clearness of its statements, and the energy of its author's protest against the scheme now before Government for the absorption of the telegraph lines. It relieves us of a duty we had assigned to ourselves of presenting arguments similar in character, but which Mr. Thurston has expressed so clearly as to render the performance unnecessary. It is all the better because it comes from such a source. Mr. Thurston is a vigorous opponent of what is so glibly styled "the great monopoly," and bears it no love, but on that very account his language will impress certain minds which no utterances of any one who ever rested his shoulder against the walls of 145 Broadway, could affect. We regret that we cannot give the address entire. As it is, we have preserved its points unweakened, perhaps strengthened by the omissions our space made imperative.

One of the strongest arguments employed to influence public opinion in favor of the governmental assumption of telegraph lines, or the base proposition of a governmental competitive line, is the low rates charged in Europe. Belgium, which, in the year 1866, lost 275,000 francs by reducing her rates to half a franc per message, is the standard authority and pattern of our telegraph reformers. That half franc is the note on which all their songs are tuned. The loss by its adoption is unspoken and unsung.

Now, half a franc is equal to our 18 cents, but if the relative circumstances of the people of Belgium and of the United States be considered—the well-known poverty of the one and the general independence and prosperity of the other, the Belgian half franc is equal to the American half dollar. And yet, notwithstanding the acknowledged disparity in the social condition of the people of the two nations, the American tariff, distance being considered, is only *half* that of even Belgium for day service, and for night service less than one quarter of the cheapest of European tariffs. This point is well shown in Mr. Thurston's address.

Not only so: in Belgium the half franc message has no assurance given of promptitude. It is sent as soon as convenient, and the telegraph officers, knowing that dispatch is everything to a merchant, and which all messages in America receive, offer to give messages prompt transmission by paying *two tariffs*, or 26 cents. Now, as the average distance of transmission in Belgium does not exceed 75 miles, and, we believe, is much less, it must be apparent that the American tariff, which, from New York to Philadelphia, 100 miles, is 25 cents, and New York to Boston, 200 miles, is 30 cents, without referring at all to the vast difference in the circumstances of the people, is largely lower for genuine, prompt telegraph service, than the cheapest tariff of any kingdom in Europe. And when it is added that a message six times as long as that which in the day-time cost 25 cents is sent at night for only twice that amount, or one-third of the day cost, and as low as one-tenth of the day price when messages exceed 120 words, the marked difference between the two systems will be more apparent.

If Government assumes our telegraph system, we agree with Mr. Thurston, that those who may be supposed to expect the largest benefits from the change will be the

first to complain, and we believe further that the motive of this movement, at least so far as Mr. Hubbard, the Boston President of horse railroads, is concerned, is less the public weal than the grinding of an enormous ax, which, after cutting and hacking the public money bag of the nation, will find its way back to the hands who know best how to use it.

### Telegraph School for Women.

Among other aids to women in obtaining suitable and remunerative labor is the opening of a telegraphic school at the Cooper Institute, New York. Here, at least, instruction will be acknowledged as possible without the deceptive promises of employment, respecting which so much has been said, and which there can be no doubt has been carried too far by some of the institutions where telegraphy is taught. With the pressure constantly brought to bear on telegraph companies to cheapen rates, with competing lines drawing off that portion of the business which provided the margins of profit, and with the multiplication of short lines connecting factories and foundries with central offices, we expect to see demands made for women to serve in telegraph offices far beyond what now exists. Young men find channels of wealth in other pursuits and must follow them, they think, to meet the responsibilities and expenses of the married state. Reduction of salary consequent upon competition drives them to change. This is not generally the case with women. Marriage to them is home and an end of personal money-making for support. Thus they accept terms inferior to men because they need support only until the marriage state provides it. There are, of course, exceptions. Women of executive ability command already salaries approximating those of men. We are glad that it is so. In the telegraph there is a sphere for woman which time must widen. There is no use hiding the necessity which is becoming more and more evident. For the long exhausting heavy work the man is essential and must be had. So far, man has proved the more reliable. He has an instinctive knowledge of business composition. This enables him to detect errors which a woman never suspects. By training she will, no doubt, acquire this, but for short lines, for office work, for a variety of service yet to be introduced into the labor of telegraph offices, and for which she is so well adapted, it is easy to see that the service of woman must, in the very nature of things, be largely demanded.

### Ocean Telegraphs.

In the Senate, January 5, Mr. Morton offered a joint resolution forbidding the landing of any submarine cable in any part of the territory of the United States without the consent of Congress, which was referred to the Committee on the Judiciary.

Mr. Conkling introduced a bill to authorize the New York, Newfoundland and London Telegraph Company to land one or more submarine cables upon the shores of the United States, and to maintain and work such cables for the transmission of messages and intelligence between the United States and Europe, of any of the intermediate places, during the existence of the company's charter. Referred to the Committee on Commerce.

### A TELEGRAPH VIA THE MOON.

Mr. Sumner presented the petition of Mahlon Loomis, M.D., of the District of Columbia, setting forth that he has discovered and invented a new mode of telegraphing, dispensing with the use of wires, and using the earth, as now, to form one half of the circuit, and the continuous electrical element far above the surface of the earth for the other part of the circuit, and asking an appropriation of \$50,000 to enable him to complete the demonstration of the value of his invention. Mr. Sumner said, in presenting the petition, he merely performed a duty, but he thought this alleged invention was either a great case of moonshine, or else it marked an epoch in the progress of invention. The petition was referred to the Committee on Patents.

By a sad accident which occurred to Cyrus W. Field, Esq., about ten days ago, that gentleman has been confined to his room under the most careful surgical treatment. The accident occurred while passing over his estate, on the edge of a steep slope, on which the ice had formed so as to make walking hazardous. Approaching too near the edge, he was carried swiftly to the foot of the declivity, much bruised, but fortunately without internal injury. Mr. Field hopes to be so far recovered as to leave for England on the steamer of January 20th.

### Sitka to Japan.

The East India Telegraph Company are endeavoring to obtain assistance from Congress to extend a cable by way of the Aleutian Islands from Sitka to Japan. The accomplishment of this work will complete the girding of the earth. If Governments interfere at all in schemes set on foot by private enterprise, this seems one of those it can legitimately aid. We need connection with China, but the distance is immense and the cost great. Let Government build the oceanic part of the route as an international highway and collect a toll on messages until the private company can purchase it, or let it give such assistance as is asked to permit an early accomplishment of the great work. Six routes are being completed from England to India. Can America afford to be without one?

At the annual meeting of the stockholders of the American Compound Telegraph Wire Company of New York, held January 14th, the old board of directors, together with the old officers, were re-elected for the ensuing year.

The reports of the Secretary and Treasurer show very satisfactory progress in the introduction of the compound wire, and the results were such as to warrant a dividend, which was declared.

L. G. Tillotson & Co. are agents for this company, and of whose operations we have desired to take more special notice. We shall do so hereafter, and are happy to be informed of its prosperity.

CAPTAIN-GENERAL LERSUNDI gave a splendid banquet to Gen. W. F. Smith, President of the International Ocean Telegraph Company, at which toasts were given and speeches made expressive of a desire for the preservation of peace and good relations between Spain and the United States.

The following is a specimen of the letters we receive from gentlemen personally unknown to us, but whom we are glad even thus to know:

NORWICH, Conn., Dec. 21, 1868.

EDITOR JOURNAL OF THE TELEGRAPH:

Enclosed please find \$1 subscription for Vol. 2. There is so much of curious interest in your little bi-monthly, I should scarcely know how to do without it. When some future D'Israeli comes to write the "Curiosities of Science," it will be found that they exceed those of *Literature*, and that electricity and magnetism will contribute no small part of the material.

Truly yours,

C. O.

### The Franco-American Telegraph.

LONDON, Jan. 14.—The Great Eastern is taking on board the submarine cable of the Franco-American Atlantic Telegraph. She will sail in June next to lay the cable from Brest to the American coast.

THE Senate Committee of Commerce have called upon the Attorney-General for his opinion upon the right of Congress to regulate the landing of telegraph cables upon the coast.

AN interesting notice of a presentation to Supt. James Coleman at Memphis is crowded out, but will appear in our next number.

### Married.

On the 7th inst., at the residence of F. H. Kean, Esq., by A. T. Spalding, pastor of the Walnut street Baptist Church, Louisville, Mr. T. R. Boyle and Miss Eva Vallandigham. No cards.

On Tuesday, December 22d, 1868, at the residence of Jos. McCabe, Bridgewater, Pa., by the Rev. Mr. Morrow, M. E. Booth of Rootstown, O., to Miss Amanda Carst of Bridgewater, Pa.

December 3d, 1868, at the residence of John C. Metz, Esq., Phillipsburg, N. J., by the Rev. John Beck, James Edwin Moon, Manager B. D. R. R. office, Phillipsburg, N. J., formerly of Lambertville, N. J., to Miss R. Jane Person of Phillipsburg, N. J.

### Died.

In Augusta, Ga., of typhoid pneumonia, on the night of December 27th, Wilson Graham, Linesman for the Western Union Telegraph Company. Deceased was a native of Missouri, and was decently buried from the Catholic Church under the kind auspices of Supt. Brenner.

## The Weary Hand.

WRITTEN BY POORDOG TRAY, ESQ.

NIGHT, December 24-25, 1888.

'Tis midnight, cold and dark and dreary,  
The lines work hard and my hand is weary;  
The sleet and rain fall fast on the ground,  
My wearied ears too long have heard the sound,  
And the lines work hard, my hand is weary.

My fingers tire, 'tis the twentieth sheet,  
But still I hear the falling sleet;  
I hear the rain as it patters around  
Upon wires and roof and the frozen ground.  
And the lines work hard, my hand is weary.

My eyes are tired, I can hardly see;  
I'm here alone and no one pities me,  
And the cold, cold rain falls down very fast,  
By my watch 'tis one o'clock and past,  
And the lines work hard, my hand is weary.

My hand almost fails me, weak are my eyes,  
I'm forced to work and none will sympathize;  
My fire has gone out and still it rains,  
And the wind blows hard against the panes,  
And the lines work hard, my hand is weary.

This is the thirtieth sheet I've had to write,  
Waiting anxiously to receive "good night,"  
Tired and sleepy and hungry, and all  
I hear is "report coming" and the rain fall,  
And the lines work hard and I am weary.

I'm almost gone so sleepy and tired,  
But 'twas for this work that I was hired;  
A poor boy is a tool for others' gain—  
He is the one to hear the sleet and rain  
And to take report however weary.

The town clock has just struck the hour of two,  
And though I still labor I am not through.  
My back is very tired and my eyes pain,  
But report still comes and so does the rain,  
And the lines work hard and I am weary.

Just as the clock struck the hour of three  
I heard the welcome words that set me free:  
"Good night" came slowly over the wire,  
But still it rained and I had no fire,  
And thus the night operator does retire!

## N. Y. Telegraphers' Ball.

The annual ball of the New York Telegraphers will be held this year at the Apollo Hall, corner of Broadway and Twenty-eighth street, New York, Friday evening, January 29. These gatherings have always been largely attended, and conducted with taste and decorum. Last year many of our distinguished citizens were present, and the occasion is remembered by those who were present as most agreeable and delightful. We trust the expectation of the managers for the present year may be fully realized, and the re-union be as cheerful and successful as they could desire. Tickets \$2.

## Shawk &amp; Barton.

We have to record the opening of an establishment for the manufactory of telegraph machinery in the forest city of Cleveland, O., the members of which are already well known, and who advertise elsewhere under the name of the firm which heads this article. Mr. Shawk has for twelve years been engaged in the shops of the Western Union Telegraph Company at Cleveland, and was for four years their superintendent. He is an ingenious, careful, prompt business man, and is the owner of a system of fire alarms which, in our judgment, is the simplest in use, and which we are surprised is not more extensively known. He comes before the public bearing the highest testimonials alike for his ability as a mechanic and his excellence as a man.

Mr. E. M. Barton all operators know as one of the very best of men and most skillful of our craft. Since he was sixteen years of age he has been in telegraph harness, and wherever known he has been honored and beloved as a man of great personal probity and purity of life. He served for a long time in the New York Central office of the Western Union Telegraph Company, and has for the last few years been chief operator at Rochester, N. Y. In both of these offices, and in the society of his many friends in both cities, he has secured for himself an enviable reputation as a steadfast friend and a christian gentleman. We wish this new firm every success in a field which seems widening daily, and which is making constant demands for increased manufacture of telegraphic appliances.

## Telegraphic Cables.

WASHINGTON, JAN. 14, 1889.

Mr. Doolittle (Dem., Wis.) offered the following joint resolution:

Whereas, Cable companies organized under the authority of the United States, propose to land cables on the shores of foreign powers; and, whereas, also cable companies, organized under the laws of foreign powers, propose to land cables on the shores of the United States, and the consent of these powers and the United States is necessary; therefore,

Resolved, That the President be authorized to consent to the laying of one or more telegraph cables from the shores of any foreign power to the shores of the United States, by any company authorized under the authority of any foreign power, provided said power will also consent to the laying of cables from the United States to the shores of such powers on reciprocal terms; and provided further, till such powers give such consent, the consent of the United States is withheld, and the laying of such cables by the authority of any foreign power is declared to be unlawful.

Referred to the Committee on Foreign Relations.

"HARRISON BROTHERS & CO.,  
Proprietors of the

GRAY'S FERRY AND KENSINGTON

WHITE LEAD, COLOR AND CHEMICAL WORKS,

connected by 125 miles of private telegraph wires, with their offices No. 16 Burling Slip, New York, and 105 South Front street, Philadelphia.

PHILADELPHIA, Dec. 23d, 1888.

MR. DAVID BROOKS, City:

DEAR SIR—In the last issue of the JOURNAL OF THE TELEGRAPH there is an article the object of which is to show, theoretically, that the insulating properties of your insulator are affected by heat and cold. As the wire of ours, insulated with your insulator of the improved form has stood the test since September, 1887, we desire to say we made a very thorough test on the 16th instant while it was storming heavily, and worked the 115 miles without perceptible escape, while our factory wires, with the ordinary insulators, only 10 miles in length, were used with difficulty.

Yours, respectfully,

HARRISON BROTHERS & CO."

## EDISON'S

## DOUBLE TRANSMITTER.

## THE MOST PRACTICAL APPARATUS OF ITS KIND YET INVENTED.

Complete Sets (put up in working order), price \$400, \$450, \$500.

For further information, address:

THOMAS A. EDISON,

Care CHARLES WILLIAMS, JR.

Telegraph Instrument Maker,

109 COURT STREET,

Boston, Mass.

## Reduction of Telegraph Rates.

The Directors of the Montreal Telegraph Company, in pursuance of their long-established policy, have decided to make another large reduction in their rates on the 1st of January next. The rate from Montreal to all offices within the Province of Quebec and as far west as Toronto, including Hamilton, is to be twenty-five cents for ten words and one cent for each additional word. The following are examples of the extent to which reductions have been made:

From Montreal to	Former Tariff.	Reduced to.
Father Point and Cacouna	50c. and 4c.	25c. and 1c.
Portland	50c. and 4c.	25c. and 1c.
Whitehall	50c. and 5c.	25c. and 1c.
Pembroke and Perth	35c. and 3c.	25c. and 1c.
Pictou and Peterboro	40c. and 4c.	25c. and 1c.
Hamilton	40c. and 4c.	25c. and 1c.
St. Catharines and London	50c. and 5c.	40c. and 2c.
Buffalo	65c. and 6c.	40c. and 2c.
Port Colborne	70c. and 7c.	40c. and 2c.
Chatham	70c. and 7c.	50c. and 2c.
Detroit	75c. and 7c.	50c. and 2c.
From Sackville to Detroit	\$1.50 and 14c.	75c. and 3c.

Arrangements have also been made with the Western Union Company by which the through tariffs of the companies have been reduced to the following points:

	Former Tariff.	Reduced to.
From Montreal to Boston	60	50
From Montreal to New York	75	50
From Montreal to Chicago	\$1 50	\$1 00
From Montreal to St. John, N. B.	1 00	75
From Montreal to Halifax, N. S.	1 05	80

And from other places in nearly like proportion.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
JANUARY 15, 1889.

To all Offices on W. U. Lines:

The following changes have occurred since January 1, the date of the last tariff order. Please note them in your tariff book:

NEW OFFICES.  
Ackworth, Ga., tariff same as Allatoona, Ga.  
Alden Creek, N. Y., tariff same as Booneville.  
Bartlett, Iowa, tariff 40 cents more than St. Joseph, Mo., from Western Union offices South and East thereof, and 40 cents less from offices North and West.  
Brigham City, Utah, tariff same as Bear River, Utah.  
Charleston, Mo., tariff 95 more than St. Louis, Mo.  
Chaumont, N. Y., tariff same as heretofore.  
Cornwallis, W. Va., (re-opened) tariff same as heretofore.  
Deer Park, L. I., (re-opened) tariff same as heretofore.  
Ft. Steel, Wy. T., tariff same as Benton, Wy. T.  
Grove Port, O., tariff same as Columbus, O.  
Halifax, N. C., tariff same as Weldon, N. C.  
Haydenville, Mass., tariff same as Northampton, Mass.  
Mayfield, Ky., tariff from points in Central and East Divisions 1.40 from Louisville and 3.00 from Washington.  
North Dighton, Mass., tariff same as Dighton, Mass.  
Needham, Mass., tariff same as Newton Centre, Mass.  
Ogden, Utah, (re-opened) tariff same as heretofore.  
Plainfield, Iowa, tariff same as Waverley, Iowa.  
Prospect, N. Y., tariff same as Dunkirk, N. Y.  
Remsen, N. Y., tariff same as Booneville, N. Y.  
So. Adams, Mass., tariff same as Pittsfield, Mass.  
Temple, Pa., tariff same as Allentown, Pa.  
Tunnel Sta., N. Y., tariff same as Harpersville, N. Y.  
Vincentown, N. J., tariff same as Bordentown, N. J.  
Williamsburg, Mass., tariff same as Northampton, Mass.  
Windsor, Conn., tariff same as Windsor Locks, Conn.  
Glenwood, Mo.,  
Liberty Landing, Mo., } Offices heretofore known as Caton  
Corning, Mo. } offices will use the Map Tariff. Other  
offices will add 20c. to the rate to Macon, Mo., for Glenwood  
tariff, and 5c. to the rate to Camden, Mo., for Liberty Landing  
tariff. The tariff to Corning will be 20c. more than the rate to  
St. Joseph, Mo., from points South and East thereof, and 20c.  
less from points North and West.

## OFFICES CLOSED.

Allatoona, Ga., Benton, Wy. T., Ft. D. O. Russell, Wy. T., Iron-  
ton, Mo., Portland, N. Y., Shell Mound, Tenn., Butler, Ga.,  
So. Yarmouth, Mass., West Harwich, Mass., and North Islip, L.I.

## GENERAL INFORMATION.

Business for South Yarmouth, West Harwich, Dennisport, and  
West Dennis, Mass., will hereafter be delivered from South  
Dennis, Mass., charges for delivery 50 cents to each.

Tariff for Other Lines from Marshall, Texas, to Tyler, Texas,  
has been reduced to 75 and 5.

Those offices who have heretofore sent and checked business  
for Canada, to Rouse's Point, N. Y., will continue to do so, using  
the rate from Montreal, given in JOURNAL of January 1, with 20  
cents in currency added.

The following explanation of the tariff of the Montreal Com-  
pany in last JOURNAL will take the place of the paragraphs  
printed after the rate for additional words.

The tariff as given above for points in Canada and New Bruns-  
wick is in gold, and for points in United States is in currency.

When the rate is 25 in gold collect 40 and 2 in currency.

" " 40 " " 60 and 3 "

" " 50 " " 75 and 3 "

" " 60 " " 90 and 4 "

" " 75 " " 100 and 5 "

When messages are sent, whether paid or collect, to any of the  
offices in this list they should be checked in currency, for ex-  
ample:

Pittsburgh sends a prepaid message of 10 words to Acton, Ont.,  
via Buffalo. It should be checked thus: 10 words 90 and 40 paid.  
If sent collect, 10 words 90 collect.

If sent to Ogdensburg, N. Y., via Oswego, N. Y., thus: 10 words  
1.40 and 25 paid, or 10 words 1.40 collect.

This tariff will go into effect January 1.

The notice in last JOURNAL relative to Tyrone and Bellefonte,  
Pa., should read as follows:

On and after January 1st, Tyrone and Bellefonte, Pa., will  
check direct with all Western Union offices. Tariff for offices on  
Pennsylvania R. R. and Bald Eagle Valley R. R. same as at pre-  
sent. Offices on Philadelphia and Erie R. R. and Lackawaxen  
and Bloomsburg R. R., including Wilkesbarre, will add 25 cents  
to their rate to Lock Haven. All other offices will add 50 cents  
to their rate to Pittsburgh or Harrisburgh, or 60 cents to rate to  
Philadelphia, taking the lowest amount. Offices having "Special  
Sheet A" will use "special rate" in computing tariff to Tyrone  
and Bellefonte.

The name of the new office at Cranford, N. J., was given as  
Crawford in last JOURNAL.

On and after Jan. 20, offices having "Special Sheet A" will  
check Suspension Bridge, N. Y., at same rate as to Lockport,  
N. Y.; also, check Mechanicsburg, Pa., 15 cents more than  
"special rate" to Harrisburgh unless otherwise ordered.

WM. OATON, President.

### Arrest by Telegraph.

A few weeks ago a dispatch was received from the Chief of Police at Manchester, by the City Marshal of Halifax, N. S., requesting him to arrest two persons who were coming as cabin passengers in the mail steamer from England, on a charge of embezzlement. On the arrival of the steamer, the birds of passage were stopped in their flight from the murky fogs of England to brighter blossoms and purer air somewhere far off in the south. Counsel was retained on behalf of the prisoners, and immediately a whole host of legal questions started up to confound the minds of the lawyers and the court. Just as in old battles, when some warrior, loved of the gods, had come to grief, the gods would come to his rescue. "Apollo shrouds the youthful hero in a veil of clouds," so if any daring police magistrate lays his unholy hands upon the liberty of the subject, a cloud of legal objections is immediately raised to protect the person arrested.

The questions involved in this case are of some importance, and the discussion of them will be useful as tending to settle what the law is upon the subject of arrest by telegraph. Can any person be arrested by telegraph? That is the fundamental question. If the answer is in the negative, then one of the great uses of the telegraph will be rendered ineffectual. A man commits a foul murder, say in Liverpool, and before he can be arrested he gets on board a steamer, say for Halifax. The news of his crime is flashed across the Atlantic, a full description, reasonably enough to satisfy a police officer at least, and the name of the party, accompany it. Is it reasonable for any man to say that such a man should not be arrested? In the case in question the court ordered the prisoners held until advices from England were received. Whether this was legal or not it was universally accepted as, at least, expedient.

The telegraph has not been in operation long enough to give rise to much litigation or legislation of the character referred to, but a few more cases of this kind will impress upon the legislatures of all countries connected by ocean telegraph the necessity for some definite rules on this subject. Such rules may form a portion of the treaty of Extradition agreed upon between Lord Stanley and Mr. Johnson. Not only in criminal matters, but also in civil cases, the telegraph promises to become of great practical importance. In a late case the Chief Justice of Nova Scotia observed that in certain cases of vessels insured by letter, lost or not lost, and information was received by the insured of the loss of the vessel before the letter of instruction had arrived at its destination, the insured was bound to communicate with the underwriters by telegraph.

In remanding the prisoners in the case referred to, the court used the following language, after stating the circumstances of the arrest: In deciding again to remand these prisoners, I feel that I am exercising judicial discretion in a case of difficulty and without any English precedent to guide my course. In the case of *Linos*, that was before the Supreme Court of this Province a few years ago, and which is accurately reported in the *Halifax Evening Reporter*, the Court, while adverting to many English cases in which a reasonable suspicion of guilt proved to exist has been held to warrant the detention of the suspected party, expressed a decided opinion that an authenticated telegram, proceeding from a police authority abroad, would be sufficient to warrant the detention of a person indicated as charged with crime, at all events, for a reasonable time to allow of sufficient proof being transmitted. In this case I cannot but feel embarrassed by the mental conflict that I experience between arguments which a sense of convenience and necessity in relation to the ends of justice suggests, on the one hand, and considerations of the sacredness

of personal liberty, and the safeguards that the law has thrown around it on the other—safeguards which, from my position, I am especially charged to maintain inviolate. I feel, then, that I should, by discharging these prisoners, practically ignore, as an effective engine for detecting crime, and preventing an escape from justice of real criminals, the existence of that instrument which science presented to civilization when it invented and introduced the Electric Telegraph. When I reflect that if a convicted murderer or traitor, sentenced by an English Court, were to escape from his jailor, and, secreting himself on board an ocean steamer, transport himself to these shores, and the submarine wires were to flash beneath the sea intelligence of his escape, in anticipation of his arrival here—in that case a question identical in principle with that before me might be presented for my decision—I cannot hesitate to decide, as I do decide, that these prisoners must be detained in their present custody until after the arrival of the next steamer from England.

### Personals.

W. H. Harrington, Manager Western Union office Clinton, Iowa, designs wintering in Troy, N. Y.

We are sorry to learn that by the abolishment of the post of "constructor of lines" in the Metropolitan District, our good friend Mr. Stephen C. Hendrickson is thrown out of his accustomed employment. Mr. H. has been a faithful and skillful officer, and has served the Company well and long. We have no doubt that in some new sphere he will secure congenial employment and appreciation.

E. D. L. Sweet, Esq., of Chicago, in renewing his subscription speaks thus of his new work as Secretary of the Board of Trustees of the Young Men's Christian Association: "Farwell Hall will be completed and dedicated January 19. Though I have had a hard summer's work, I feel that it will be one I shall ever look back to with pride and pleasure."

Thomas Brown takes charge of the New Brunswick, N. J., office, vice L. M. Levy transferred to Washington, D. C.

Pennington takes charge of the Market street depot office Newark, N. J., vice P. H. Flynn transferred to New York.

Wm. P. Curl, operator main office Philadelphia, resigned.

Penny O. Bryan, of Charleston, appointed to main office Philadelphia.

E. Alex. Scott appointed to main office Philadelphia.

John E. Cardwell, of Philadelphia main office, takes charge of Lancaster, Pa., office, vice D. H. Potts transferred to Elizabeth, N. J.

Miss E. Carrie Cook takes charge of the Fifteenth street brokers' office Washington, D. C.

Del. Hackley takes charge of the Lock Haven, Pa., office, vice F. D. Squire transferred to Washington, D. C.

G. W. Cosden takes charge at Elkton, Md., vice H. A. Wells transferred to Trenton, N. J.

F. H. Gartian takes charge at Dover, N. J., vice R. A. Torrington resigned.

Ed. Sholes relieved S. A. Emery at Lanark, Ill., December 14. Mr. Sholes is a son of the late esteemed superintendent of the N. W. Tel. Co., C. C. Sholes, and a more worthy young man does not exist.

Smith Rae relieved G. D. Field at W. U. R. R. office Beloit, Wis., December 9.

W. J. Weld took charge of Rockton, Ill., office same date, vice Rae promoted.

Thoms Master relieved T. N. Shanks at Mt. Carroll, Ill., December 22.

THE speech of Mr. Orton, President of the Western Union Telegraph Company, at the banquet to Professor Morse, was as solid and effective an argument as could be devised to affect the minds of business men against the proposition to have the Federal Government seize, own, and manage the telegraphs of the United States. When Congress assembles again we shall have something to say on this proposal to overburden, with a novel and enormous business, the government machine, which is already crippled in efficiency by the vast variety of its concerns, which cannot even lay duties wisely nor collect taxes thoroughly, and which everywhere and in all things is outstripped by the efficiency of private enterprise.—*N. Y. World*.

MR. ISHABOD WASHBURN, an old citizen of Worcester, Mass., about 70 years of age, the proprietor and founder of the celebrated Washburne Iron Wire Works there, is dead. Several months ago he had experienced a severe paralytic shock, and his death was not altogether unexpected. Mr. Washburne had accumulated great wealth in the manufacture of telegraph and other kinds of wire, and will long be remembered for his munificent gifts for charitable purposes.

CHESTER, PARTRICK & CO.,

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

88 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be entrusted, whether for the construction of any or all lines of telegraph or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunlon Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunlon Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

**The Handkerchief Telegraph.**

Every person who has read the play of "Othello" remembers the ejaculation of the jealous Moor, when he called upon Desdemona to produce the handkerchief! the handkerchief! They also remember that because she did not bring forth the handkerchief, and it being found in the possession of Cassio, the black scamp crammed a pillow down her throat, producing suffocation and death. We merely remind our lady readers of this fact in order to place them on their guard, in case they should happen to be wedded to a fellow like that jealous Moor, and should be caught by him making use of a code of signals we propose to give. This code is called the language of the handkerchief, and as it is quite a fashionable mode of communicating thought in Eastern cities, and as all the fashions of the East are adopted here, we give it. It must be remembered, however, that the "code" is only to be used at balls, parties, theatres, and on the street, but never in church.

Drawing it across the lips—Desirous of an acquaintance.

Drawing across the eyes—I am sorry.

Taking it by the centre—You are too willing.

Dropping—We will be friends.

Twirling in both hands—Indifference.

Drawing across the cheek—I love you.

Drawing through the hands—I hate you.

Letting it rest on the right cheek—Yes!

Letting it rest on the left cheek—No!

Twirling it in the left hand—I wish to be rid of you.

Twirling it in the right hand—I love another.

Folding it—I wish to speak with you.

Over the shoulder—Follow me.

Opposite corners in both hands—Wait for me.

Drawing across the forehead—We are watched.

Placing on right ear—You are changed.

Letting it remain on the eye—You are cruel.

Winding around forefinger—I am engaged.

Winding around third finger—I am married.

Putting it in the pocket—No more at present.

**A Merri Superintendent.****CHRISTMAS PRESENTATIONS.**

One of the pleasantest and gayest of Christmas gatherings was the occasion of the presentation to Mr. C. G. Meriwether, General Superintendent of the Fourth District of the Western Union Telegraph Company at Mobile, Ala., of a very handsome diamond ring, by the employees of the Mobile office.

The ring itself was a very valuable testimonial, and was made more so by the very kind words in which it was presented by Mr. Wm. Sandford, the very handsome and popular Manager of the Mobile office. This gentleman's little speech was neat and appropriate, and we doubt whether Mr. M. was more astonished by the brilliance of the ring than by that of the ring of friends who pressed congratulations upon him.

There was a notable "spread," jokes went round by telegraph, and *bon-mots* were expressed via the Mobile & Ohio R.R. The superintendent of the latter road, Mr. Fleming, and of the Southern Express Company were on hand; the drama and the press were represented by Messrs. De Leon and Waldron; there was a feast of reason and a flow of soul, and all went merry as a Cowbellion's bell.

We know of no one of our friends more deserving of such a compliment than Mr. M., and we hope he will soon take the "daughter of some good mother" and let her wear it as his marriage gift, and trust his shadow may never be less.

Thus saith the Mobile *Register* and *Tribune*, and the JOURNAL OF THE TELEGRAPH says amen.

Here is the correspondence:

MOBILE, Ala., December 25, 1868.

C. G. MERIWETHER, Esq., Supt. Fourth District Western Union Telegraph Co.:

Dear Sir—It is with great pleasure that I am permitted in behalf of the operators and employees of the Fourth Dis-

trict of the Western Union Telegraph Company, to ask of you the acceptance of this beautiful diamond ring as a Christmas present from them, as a slight token of their appreciation of you, as their executive head, and for the impartial manner in which you have discharged the duties incumbent upon you.

Wishing you a Merry Christmas and a Happy New Year,  
I remain yours very truly,

WILLIAM SANDFORD.

MOBILE, December 25, 1868.

WM. SANDFORD, Esq.:

Dear Sir—Allow me to return you and all the employees of the fourth district my most sincere thanks for this most beautiful and costly present. I accept it and shall always prize it not only for the value it possesses in itself, but for the kind spirit in which it is given. I shall keep it as a valuable memento of this occasion and as a kind remembrance of you all. May the personal friendships founded on regard and esteem, formed for many of you long years ago when we labored side by side in the ranks, continue to shine in the future with as bright and as pure a light as that which now flashes from the gems in this ring. It is a source of extreme gratification to me to say that in all my efforts to conform to and carry out the orders of my superior officers, I have always found a cheerful and prompt obedience on the part of every manager and employee on the district. It is to this promptness and obedience on their part that I am indebted for any success that may have followed any of my efforts. I wish you all a Merry Christmas and a Happy New Year. During the coming year may you all be able to answer at all times when duty calls, and may the *Grand Chief Operator* who has called several of your number away during the past year to work on that line which extends into "that undiscovered country from whose bourne no traveler returns," fail to sound the last call for any of you. Yours, very truly,

CHARLES G. MERIWETHER.

The *Tribune* adds: We had hardly recorded the presentation of the ring mentioned above when we heard of a new "telegraph ring" in Montgomery, Ala., who sent him by all odds the handsomest Meerschaum we have seen for many a day.

Pure meerschaum mounted in gold and inscribed with name and date, is in itself "a joy forever." But the intrinsic value of this costly gift is far less than that added to it by the kind words of presentation in the following correspondence:

MONTGOMERY, Ala., Dec. 25, 1868.

MR. C. G. MERIWETHER, Supt. 4th Dist. W. U. Tel. Co.,  
Mobile, Ala.

Dear Sir: The undersigned, employees of the Western Union Telegraph Company, at Montgomery, Ala., desire to tender you as a "Christmas gift," and as a slight testimonial of their respect and esteem, the accompanying "Meerschaum Pipe."

It is earnestly hoped by each and every one that this offering will prove an acceptable one, and be the means of adding an additional charm to your enjoyment of the "fragrant weed."

Yours, very truly,

C. W. HILLS,  
VIRGIL P. MOON,  
JOHN L. JONES,  
O. K. GALLASPIE,

S. E. HOLT.

THE WEST. UNION TELEGRAPH CO.,  
SOUTH. DIV., SUPT'S OFFICE, 4TH DIST.,  
MOBILE, Ala., Dec. 26, 1868.

Gentlemen: Your magnificent Christmas present came to hand by express to-day. Allow me to thank you most heartily.

I shall always value it, not only for its intrinsic worth, but for the kind expressions of esteem and regard for myself, which accompany it and which render it doubly valuable.

Thanking you again kindly, I wish you all a Happy Christmas; and may you one and all live to enjoy and celebrate many of them.

Yours, truly,

C. G. MERIWETHER.

To Messrs. Hills, Lines, Moon, Murray, Cooke, and others, employees of Montgomery (Ala.) Office.

## Lightning Rods.

It is known how important it is to be able to be always assured of the material worth and of the constant working of the lightning conductor. A conductor which imperfectly conducts the electric fluid is no longer a preserver from the lightning, but a formidable accessory. The savant M. H. De Parville proposes a very simple and a very practical means of ascertaining the integrity of conductors. The process of M. De Parville consists in constantly passing the current from a small pile through the lightning rod, and leading the conductors to a spring sounder. The sounder remains quiet when the lightning rod works well; on the contrary, it resounds when the electricity is no longer passing, or when (exceptionally) it has been forgotten to recharge the pile.—*Jour. des Telegraphs.*

## Foucault's Ship Telegraphs.

Dr. Foucault has introduced, on board of the steam packet *Europe*, belonging to the Transatlantic Company, a telegraphic system of his invention, destined to increase the security of the vessel, and to facilitate the transmission of the orders to the crew. From their cabins the officers can correspond with the helmsman, and they are immediately advised of the approach of another vessel, as well as of all the accidents which may happen.

This system is provided with an alarm clock, and the transmission of signals is so rapid that in an instant all the sailors receive the necessary instructions. It is said that the Minister of the Navy intends to apply the invention to the vessels of war in the French navy.

NOTE.—We have had the pleasure, through the courtesy of Dr. Foucault, of seeing the operation of his signals. In directing the course of the ship from the pilot bridge the commander turns a pointer to the north, starboard, or larboard, as the case may be, and which can only be replied to by obedience to the order given, the wheel performing the office of manipulator. In like manner the amount of veerage allowed the pilot at sea is given, and any departure from this causes an alarm-bell to ring in the captain's office.

The following is the latest news from Paris:

"The telegraph wires of the United States, in working condition, in 1848, was near 16,800 kilometres (about 10,450 miles). In 1858 this number had increased to 64,000 kilometres (about 40,000 miles), and before the end of the present year there will be 168,000 kilometres (about 105,000 miles) of wire finished and in working order. If it increases in this proportion the 400,000 kilometres (about 250,000 miles) of wire, which they regard as still being necessary, can be easily finished before 1878. But there is a serious difficulty, the streets of New York are already bristling with posts filled with wires; experience has shown that their working becomes more difficult as the number of wires are increased. Likewise in storms, the posts filled with wires offer so much surface to the wind that they are frequently overthrown, especially in the winter. They prefer, then, instead of establishing new wires, rather to seek the means of increasing the rapidity of transmission. They have already created a vocabulary of signals, representing entire words, and even entire sentences, for common use; the transmission is much quicker, but it will be very difficult to apply this system to the dispatches which are addressed to the press and which forms one of the principal elements of traffic."—*Jour. des Telegraphs.*

## The French Cable.

Recent publications represent this enterprise as cloudy, and ventilate a few unpleasant facts concerning it.

1. It is represented as an exclusively anti-American affair. To prove this, the names of the Baron Erlanger, the European agent of the late confederacy, William Henry Schroeder, of London, Hon. Robert Lowe and others, regarded as hostile to our government are cited as its projectors. This we do not regard as having any special significance, although it might for a time possibly affect the employment of the new cable.

2. The value of the exclusive rights on the shores of France and the United States are doubted. The grant of the Legislature of the State of New York has no value, inasmuch as only Congress can confer it. Thus, a payment of \$50,000 in gold, and \$50,000 more promised, as payments for the rights thought to have been secured, are lost or spent in vain.

3. The American trustees, in whose hands the landing ground in Duxbury, Mass., has been placed, are members of the Coast Survey, and as government officers, are disqualified from holding any such trust.

4. The stock is represented as having been secured by a trick in advertising that in London, where the enterprise must have been looked upon as hostile, £1.5 was offered on £1 paid in, leading to an immediate subscription in France of the entire residue.

Aside from all these questions, which, after all, amount to very little, the commercial success of the enterprise appears to us as questionable. It is fallacious to carry out an arithmetical increase of business, based upon a reduction of rates. There must be an actual commer-

cial or social necessity for communication to make the medium of carrying it on remunerative. Is there such an intercourse between France and America as to make this direct cable a success? Four-fifths of the cable intercourse so far has been British. Will the new French cable change that relation? and is there in waiting any social or commercial necessity on which any great enlargement of intercourse may be predicted? It may be that there is. Time will solve all these questions. What the world is most interested in after all, is in providing such accessibility of communication as shall bring the populations of the globe so near to each other as to foster the feeling of a common interest and a universal brotherhood. Whatever tends to this is welcome.

A PARLIAMENTARY return shows that there are in Great Britain and Ireland 90,668 miles of wire for public use, and 4,969 miles of wire used for railroad companies only. The number of miles of posts and underground lines constructed is 21,751 open to the public, and 245 used for railway purposes only. The average number of wires per mile is 4.16. There are 4,695 miles of submarine telegraph cables (including the Atlantic cable) connected with places in the United Kingdom, and 8,146 miles of wire. The average number of these wires per mile is 1.73. There are 3,381 telegraph stations open to the public.

The arrangements for the purchase of the British Telegraphs are actively going on, and a commission appointed by the Accountant General has nearly concluded the inquiry into what the net profits of the company really are. A complete collection of the instruments used has been arranged in the library of St. Martin's le Grand. It is said to be a most interesting display, and one which shows in a remarkable manner the vast progress which has been made since the first application of electricity to the purpose of telegraphy.

## Russia.

The establishment of the Electro-Magnetic Telegraph in Russia dates from the year 1853. The first lines were those from St. Petersburg to Moscow, Cronstadt, Warsaw and Koenigsberg. With the establishment of this last line, for which an agreement was concluded with Prussia, commenced the international telegraphic correspondence with the other States of Europe.

From that time the telegraph system was extended over all Russia. In the course of 13 years the two capitals were put in communication with the most important and the most distant cities, and with all the neighboring States. It is to be remarked that the execution of the telegraphic system presents infinitely more difficulties in Russia than in the rest of Europe, as much from the immense distances as of the climate, of the smallness of the population of many of the districts and high price paid for transportation of materials. In 1865 there were 61,450 versts of telegraph with 323 stations, and they sent 1,644,375 messages. No one can contemplate the former cost, in time and money, necessary for sending dispatches, without counting the road horses killed on post routes they required, upon many of the points, from one to two months to reach, without feeling the great change the telegraph has effected.

It is a fact not generally known, perhaps, that Washington drew his last breath in the last hour of the last day of the last week of the last month of the year, and in the last year of the century. He died at 12 o'clock Saturday night, December 31, 1799.

A BEAUTIFUL THOUGHT.—The sea is the largest of all cemeteries, and its slumberers sleep without monuments. All other graveyards, in all lands, show some distinction between the great and small, the poor and rich; but in the ocean cemetery the king and the clown, the prince and peasant, are all alike undistinguished. The same waves roll over all—the same requiem by the minstrels of the ocean is sung to their honor. Over the remains the same storm beats, and the same sun shines; and there, unmarked, the weak and powerful, the plumed and unhonored, will sleep on until awakened by the same tramp.

## New Postal Regulations with Great Britain.

THE new postal convention with Great Britain goes into effect on the first day of January, 1869. It provides as follows:—

LETTERS, 12 cents per single rate of one-half ounce in the United States, or 6 pence (12 cents) in Great Britain, prepayment optional. A fine of 5 cents in the United States, or 2 pence (4 cents) in the British post-office, will, however, be levied and collected in addition to the deficient postage on each unpaid or insufficient prepaid letter received by one country from the other.

NEWSPAPERS, 2 cents each in the United States, or 1 penny each in Great Britain, if not exceeding four ounces in weight.

BOOK-PACKETS, including printed papers of all kinds, etc., and also patterns or samples of merchandise, including seeds and grain, when not exceeding one ounce in weight, 2 cents in the United States or 1 penny in the British post-office. When exceeding one ounce and not exceeding two ounces in weight, 4 cents in the United States or 2 pence in Great Britain. When exceeding two ounces and not exceeding four ounces in weight, 6 cents in the United States or 3 pence in the British post-office, and when exceeding four ounces in weight, an additional rate of 6 cents in the United States or 3 pence in Great Britain, will be charged for every additional four ounces or fraction thereof.

The postage chargeable upon *all articles of printed matter*, including newspapers, books, and also patterns or samples of merchandise, *must be fully prepaid at the mailing office in either country, and is in full to destination*, the receiving country delivering the same in all cases without any charge whatever.

## The Bronze Doors of the Capitol.

THE bronze doors designed, one for the entrance to the House of Representatives and the other for one of the doorways of the Senate chamber at Washington, and which had their inception some fifteen years ago, are now in their places and receiving their finishing touches. Each door weighs entire eight thousand pounds, its casing six thousand more, so that the total weight of the bronze-work in each door is fourteen thousand pounds. The designs upon the panels illustrate the history of the discovery of America by Columbus, and sprang from the genius of Crawford and Rogers, the former of whom died before his portion of the work was quite completed. The sum total of the cost to the Government will be about fifty thousand dollars.

A NEW invention—by M. Delaunier, of Paris—for destroying fire-damp in mines has been lately laid before the Academy of Sciences. It consists of a copper conductor, broken at intervals, but joined by very fine gold wire soldered to the copper, the gold wire being surrounded by flowers of sulphur, which ignite easily. By passing strong currents of electricity through the copper wire, the gold wire becomes red-hot, and thus ignites the sulphur, which burns any noxious gases which may be present. It will, of course, be understood that the electric current is made to pass through the apparatus before the descent of the miners into the mine. The Academy of Sciences have, it is stated, reported very favorably on M. Delaunier's invention.

M. DELUMIER, in a communication to the Academy of Science, states that the following mixture forms an exciting liquid for galvanic batteries of great energy and economy, disengaging no deleterious fumes or gas. Dissolve twenty parts by weight of proto-sulphate of iron in thirty-six parts of water. Then stir in seven parts of a solution of sulphuric acid (equal parts); then in the same manner add one part of diluted nitric acid (equal parts).

## Electricity as an Illustration.

There is scarcely anything more freely or effectually used in the oratory of the lecture room or the pulpit, as an illustration, than the electric fluid, or its co-relations, light, heat, magnetism, and the like. One can scarcely read a newspaper, secular or religious, without remarking this fact. Dr. Cheever was accustomed to employ the peculiarities of the lightning and the telegraph wire with great power and beauty. Here is a specimen from another noted religious writer:

"I have seen a heavy piece of iron hanging on another—not welded, not linked, not glued to the spot—and yet it cleaved with such tenacity as to bear not only its own weight, but mine too, if I chose to seize it and hang upon it. A wire charged with an electric current is in contact with its mass, and hence its adhesion. Cut that wire through, or remove it by a hair's breadth, and the piece of iron drops dead to the ground, like any other unsupported weight. A stream of life from the Lord, brought into contact with a human spirit, keeps the spirit so firmly that no power on earth or in hell can wrench the two asunder. From Christ the mysterious life stream flows, and to Him it returns again. In that circle the feeblest Christian is held safely; but if the circle be broken, the dependent spirit instantly drops off."—*Arnold*.

## Removal of Telegraph Wires.

About one year ago the Keystone Telegraph Company, afterwards merged into the Pacific and Atlantic, placed four wires on the poles of the Western Union Telegraph Company along Market street from Third street to West Philadelphia.

On last Friday night these wires were removed, and on Saturday an injunction was granted by Judge Allison restraining the Keystone or Pacific and Atlantic Co. from again placing their wires on the poles referred to.

The Pacific and Atlantic assumed the right to use these poles under their contract with the Pennsylvania Railroad Company, which allows them the use of the railroad company's poles between Philadelphia and Pittsburg, but which did not and could not give them the right to use the poles on Market street in this city, in which the Pennsylvania Railroad Company had no right, beyond that of having their own railroad wires thereon, which privilege they enjoy, in return for certain facilities furnished to the telegraph company when the poles were set up.

## A Curious Experiment.

Take a piece of pasteboard about five inches square, roll it into a tube with one end just large enough to fit round the eye, and the other end rather smaller. Hold the tube between the thumb and finger of the right hand (do not grasp it with the whole hand); put the end close against the right eye, and with the left hand hold a book against the side tube. Be sure and keep both eyes open, and there will appear to be a hole through the book, and objects seem as if seen through the hole instead of through the tube. The right eye sees through the tube and the left eye sees the book and the two appearances are so confounded together, that they cannot be separated. The left hand can be held against the tube instead of the book, and the hole will seem to be seen through the hand.

## Repudiation in the St. Paul Chamber of Commerce.

ST. PAUL, Minn., December 22.—The Board of Directors of the Chamber of Commerce last evening passed a resolution repudiating their subscription to the Mississippi Valley National Telegraph Company, on the ground of misrepresentation.

SOME years ago a man in Berlin assisted an old man who had slipped on the pavement. A few days back he was surprised by receiving fifteen thousand dollars, left him by the person he had so slightly benefitted.

**L. G. TILLOTSON & Co.,**

11 DEY STREET, NEW YORK,

**MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS**

AND

**MATERIALS OF EVERY DESCRIPTION.**

General Agents for the

**AMERICAN COMPOUND TELEGRAPH WIRE COMPANY,**

The Compound Wire has now stood every test to which it can be subjected. Over twelve hundred miles of it are now in operation with the most satisfactory results.

**OREIDE METAL,**

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Asels*, which was patented August 15, 1885. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office order, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

## Trial By Telegraph.

BY HON. J. D. CATON.

In the spring of 1849, St Louis steamers were daily arriving at the landing at Ottawa, and generally left teeming with the throng rushing to the gold-regions of California, then lately discovered. Telegraph communication had already been established between Ottawa and Chicago, but it was so new that many looked upon it as a myth, and it had secured the entire confidence of but few, of whom I was one.

One day a constable came to my chamber with a telegram from some one in Chicago, desiring the arrest of a man described for the larceny of a watch.

The officer stated that he recognised the accused, who had just arrived from Chicago, and who had already taken passage on the steamer then at the landing, and which would sail in three hours, and desired my opinion as to his duty in the premises. I told him if he would make a complaint before me, setting out the telegram in his affidavit, and stating that he believed that the party was guilty of the larceny charged, I would issue a warrant upon it. This was done, and very soon the accused was before me. He was a laboring man of respectable appearance. He stated that he had boarded with the complainant in Chicago, that he had procured the watch in a fair trade, of which the other party had become dissatisfied, and had made some threats before he left Chicago, and gave the name and residence of a witness who would prove these facts. Accused also stated that he had taken passage on the boat with several companions, bound for California together. That to be taken back to Chicago to vindicate his innocence, would break up all his arrangements, and result in most serious inconvenience at least.

The whole bearing of the man impressed me with the belief that he was telling me the truth, and I feared I had acted hastily and imprudently, if not illegally. I had gone too far to let the man off on his own statement, and yet I feared that to detain him would be a great wrong.

Soon it occurred to me that if I could arrest a man by telegraph, I might try him by telegraph. I immediately sent a dispatch to Hon. J. H. Woodworth, then Mayor of Chicago, whom I well knew, stating the case, and asked him to have brought before him the complainant and the defendant's witness, and examine them, and see if there was reasonable cause for detaining the prisoner, and to report by telegraph, in two hours if possible; well-knowing that then, as now, Chicago was a fast place, and always did business quick.

Before the expiration of the two hours I received a report from Mayor Woodworth, stating that he had examined the complainant and the defendant's witness, and that he was satisfied that there was not sufficient ground for the charge of larceny. Of course, the prisoner was at once discharged, and with his friends rushed in triumph to the steamer, followed by quite a crowd who had become interested in the

novel proceeding, and among whom a general sympathy had arisen on behalf of the accused. In three minutes after he was on his way to the new Eldorado, but whether he made his pile or not I do not know, for I have never heard of him since.

This was the first, if not the only trial, I ever heard of being conducted by telegraph eighty miles off. But it seemed much more of a mystery than it would now. I still believe that my whole course was legal. I am one of those who believe that the law is capable of adapting itself to all the improvements of advancing civilization.

OTTAWA, Ill., 1869.

## Magnetic Traveling Stones.

They have walking stones in Australia, and, as we are informed, they have traveling stones in Nevada. Here is a description: They were almost perfectly round, the majority of them as large as a walnut, and of an irony nature. When distributed about upon the floor, table, or any other level surface, within two or three feet of each other, they immediately begin traveling toward a common center, and there huddle up in a bunch, like a lot of eggs in a nest. A single stone removed to a distance of three and a half feet, upon being released, at once started off with wonderful and somewhat comical celerity to join its fellows; taken away four or five feet, it remained motionless. They are found in a region that, although comparatively level, is nothing but barren rock. Scattered over this barren region are little basins, from a few feet to a rod in diameter, and it is in the bottom of these that the rolling stones are found. They are from the size of a pea to five or six inches in diameter. The cause of these stones rolling together is doubtless to be found in the material of which they are composed, which appears to be loadstone or magnetic iron ore.

## Major Abasa's Yarn.

Major Abasa, of the Collins overland telegraph expedition, told me of a peculiar mode of effecting marine insurance. I do not believe it will ever be popular among American sailors.

"The Chukchees in their trading excursions frequently cross Behring's Straits by way of the Diomed Islands. Their voyages are made in boats formed of seal-skins sewn together and stretched over light frames of wood. The boats dance like corks upon the waves, and when heavily laden in anything beyond an ordinary breeze they are far from safe. The owner of each boat is generally the captain, and has a crew of six or eight men.

"When a storm arises, and the boat must be lightened, its owner looks after its welfare. He throws his crew into the water and reserves his goods to the last."

"But," I asked, "do the men never object to this peculiar jettison?"

"I believe not," said the Major. "They are under the impression that duty requires the sacrifice. They are pagans, all of them, and drown themselves with a complacency unknown to Christian nations."

## The Telegraph and the Government.

OPINIONS OF THE PRESS.

[From the New York Tribune.]

We have said that the Government ought to let the telegraph business alone. It is outside of its province altogether. The scheme to annex the telegraph to the Post-Office proceeds nominally upon the assumption that there is an identity between the carrying of letters in a bag by stage, rail and horseback, and the sending of telegrams on wires. The two differ wholly, having nothing in common save final communication by writing. They are as unlike as the express package business and the carriage of newspapers by mail. The Government might as properly push the Adams and the Merchants' Union Express Companies out of their business, and carry bundles and parcels all over the United States, as to undertake to do telegraphing for the people. There is no country in the world so supplied with telegraphic facilities as are the United States. In Europe, containing the accumulated wealth of two thousand years of busy civilization, having a population of 288,000,000, and containing 39 cities each possessing over 100,000 inhabitants, there is but one telegraph to every 60,249 persons. In the United States, having a population of only 31,000,000, and containing but ten cities of 100,000 inhabitants, the remotest history of the country scarcely reaching back 250 years, there is a telegraph office to every 7,549 of population.

Beyond all question, we Americans have the best telegraph system in the world, and one that provides perfectly for its own extension to meet future wants, without taking a dollar from the Treasury or imposing a tax on the people. There is no need of the interference of the Government in this thoroughly established and perfectly managed business. The proposal to do so is meddlesome and mischievous.

If it were adopted, where would a limit be put to this extension of the functions of Government into the domain of private enterprise? There is now strong talk in England in favor of the ownership and management by the Government of all the railways in the kingdom. If Congress should vote to assume and carry on the business of telegraphy, inevitably there would come in time a howl that the Government should provide the people with cheap fares and freights; and a political party would be formed to effect the purchase of all our railroads, that they, too, may be run by the United States. The dike erected to confine its functions to civil and military administration is already broken down in many places. Where will the overflow of its authority stop if it goes into telegraphing? It will not stop until the simply representative character of the Government is lost; until the self-helpfulness and freedom of the people are gone; until the Federal machine is smashed by a mountainous bankruptcy; until the scoundrelism which permeates the non-collection of the whisky revenue shall characterize office-holding all over the United States.

This fatal career once entered on, there will be no

retreat. The beginning would touch the end. The construction and operation by the Government of a line of telegraph from Washington to New York would inevitably involve in time the purchase of the other lines and their operation by the Postmaster-General. This man, in nineteen cases out of twenty, would probably be a second-rate lawyer, starved out of his profession into politics, and as unfit to superintend a system of telegraph as to sail a frigate. The Washington rule, of three times as many employees as are necessary to do the work, would be forthwith introduced into the Telegraphic Bureau. Fifty thousand operators, messengers and laborers would be spawned upon the country. They would be officially born with a constitutional aversion to hard work and with an incurable tendency to shirk. They would of course be of the "twenty per cent." breed. They would chronically want their salaries raised, and they would periodically get them raised. They would be politicians—for their places would be controlled by Congressmen and party leaders, and would be largely filled for partisan purposes. Every change in the Federal Administration would change, to a great extent, the officials and employees of the Telegraphic Bureau. Unsteadiness, irresponsibility, unskillfulness, neglect and waste would certainly characterize its service. The Government would lose enormously. Every interest in the country would suffer more or less. The Press would suffer most. But so widespread and comprehensive would be the injury, that there is not a family in the United States which uses the telegraph for messages of death, of new life, of safety, of sorrow, messages of request, appointment, inquiry, response, order, and countermand, that would not experience delays or failure in the receipt or delivery of dispatches that require, and do now get through the existing lines, speedy and accurate transmission. Can there be an honest question that this result would follow the assumption of telegraphy by the Government? We call on Congress to put its foot on this Government Telegraph scheme so hard as to discourage its resurrection for at least a decade.

### Telegraphing by Government.

We use the telegraph very extensively, and pay it a good deal of money: so that there are few whose personal advantage from cheapening its use would be greater than our own; yet we do not regard with favor any of the bills looking to the establishment of a Government Telegraph. Here are some of our reasons:

I. The prevalent tendency in our day is toward a further restriction rather than an enlargement of the sphere of Government. We have (for instance) a good many public markets in this city, which are, for the most part, public nuisances. Had the city left this whole business of purveying free to private enterprise, only overseeing it in the interest of public health, few can doubt that our supply of food would have been better and cheaper than it is. The same is the case with many other attempts to serve or save the citizen through the agency of Government. Most certainly, we would not limit the sphere of Government to the mere prevention of breaking heads and picking pockets; but we should ponder long before enlarging it.

II. A Government Telegraph is usually proposed as an adjunct of the Post-office. Our Government already claims and enforces a monopoly of the business of carrying letters, charges its own prices, collects some \$15,000,000 a year from the people for letter-carrying, and then loses some \$6,000,000 a year by the business. We submit that it should show a better balance-sheet on this account before extending its sphere of operations.

III. We never owned any telegraph stock, and expect to own none; we are a daily and heavy customer

to telegraphs, and expect to live and die such. We presume that a Government Telegraph would somewhat cheapen the cost of messages; but the money invested in establishing it would never be returned to the Treasury. The clamor for a reduction of charges (as now with letters) would steadily overbear any hope of profit. Can it be right, we ask, to tax the whole people for the benefit of that small minority who send messages by telegraph? Would it not be better to start Government establishments for potato-growing on a gigantic scale, so as to supply the poor cheaply with wholesome and nourishing food? Where one wants cheap messages, many would be benefited by having a sure and ample supply of cheap potatoes.

IV. Government, in this and other free countries, is and must be largely an affair of party. The Government of this country has been, is, and must be, to a great extent, the rule of the dominant party. Would it be well to have the telegraph under the absolute control of either party in an excited Presidential election? Could the outs safely use it? Could the people implicitly trust it? Remember how the mails were rifled under Jackson, with the tacit approval of Postmaster-General Kendall, on the assumption that it was right to take and burn Abolition documents if circulated in Slave States. Consider Gen. Jackson's and Gov. Marcy's official recommendations that the circulation of such documents be prohibited by law. We should not like to have the telegraph controlled, throughout the ensuing Presidential canvasses, by our political adversaries, nor yet by our political friends.

V. The Government is heavily in debt, and its finances are not in good condition; yet it is bored and importuned for subsidies on this side and on that—all of them on the pretense of public advantage; many of them with just grounds for such assumption. If the Northern and Southern Pacific Railroads could both be built within the next five years, we believe they would add five hundred millions of dollars to our national wealth within the twenty years succeeding. We demur to their present construction by Government aid, simply that the state of our finances forbids it. But, if our Government is able to build telegraphs where they are not wanted, why not railroads where they are the very first necessity of settlement and civilization?

We might go on for an hour longer, but let the above suffice for the present. We think the Government should let the telegraph business alone.—*N. Y. Tribune.*

[From the New York World.]

### The Proposed Governmental Telegraph.

Unfortunately for the peace of Congress and the interests of the owners of Western Union Telegraph stock, Washburne, of Illinois, once went to Europe, and while straddling about Belgium and France, contracted some facts, statistics, and crude impressions concerning the management of telegraphs by government, which have broken out on him here at home in the form of a disease. "Washburne of Illinois" crossed the sea eastward—a watch-dog of the shaggiest, savagiest strain. He recrossed the sea with a kunocephalic idea that the arbitrary system of Louis Napoleon, which made the magnetic telegraph an instrument of state and "the fingers of the police," was the one thing necessary to make the people of the United States prosperous and happy. He was in love with Napoleon the telegrapher. Of all that he saw in old and wondrous Europe, he brought home only the idea that telegraphing should be taken out of the hands of the people of the United States and made a function of government. He proposed to annex the telegraph to the post-office.

There was never such a hallucination as Washburne's idea that the people of Europe have greater telegraphic facilities than the people of the United States have, and his deduction therefrom that telegraphy performed by a government is cheaper and better than that performed

by individuals or a company. Here are the statistics of telegraphs constructed and operated under governmental control, as compared with those constructed and operated under private control:

#### UNDER GOVERNMENT CONTROL.

Name of Country.	No. of Offices.	No. of Messages sent.	Population.	Proportion of Offices to Population.
Austria.....	851	2,507,472	39,411,309	1 to \$6.311
Belgium.....	356	1,128,005	4,964,451	1 to 14,000
Bavaria.....	.....	.....	4,541,556	.....
Denmark.....	89	308,150	2,468,713	1 to 27,000
France.....	1,209	2,507,472	38,302,625	1 to 31,600
Italy.....	529	1,760,889	25,925,717	1 to 49,300
Norway.....	73	269,375	1,433,488	1 to 19,000
Prussia.....	538	1,964,003	17,739,913	1 to 33,000
Russia.....	308	836,653	68,224,832	1 to 221,000
Switzerland.....	252	668,916	2,510,494	1 to 10,000
Spain.....	142	533,376	16,302,625	1 to 109,000
Totals.....	4,347	12,486,311		

#### UNDER PRIVATE CONTROL.

Name of Country.	No. of Offices.	No. of Messages sent.	Population.	Proportion of Offices to Population.
Great Britain and Ireland.....	2,151	5,781,189	29,591,009	1 to 13,714
Domin. of Canada.....	382	573,219	3,976,224	1 to 10,400
United States.....	4,126	12,346,952	31,148,047	1 to 7,549
Totals.....	6,659	18,741,360		

—which, being interpreted to the Washburnian comprehension, means that in Continental Europe, where the telegraphs are built and operated by monarchs as arms of the civil administration, there are but 4,347 offices among a population of over 250,000,000—only one office to every 60,249 people; while in the United States, where telegraphy has been a free business to everybody, and has been wholly developed as a private enterprise, there are 4,126 offices in a population of 31,000,000—a convenient office to every 7,549 inhabitants. These facts ought to be conclusive. But again: the extent of miles and wires belonging to a single American company, the Western Union Telegraph, is more than twice that of the government of France, three times that of Prussia, and equals the combined systems of Belgium, France, Switzerland, Austria, Prussia, Spain, Italy, and the lesser German States all put together. Once again: The Western Union Telegraph in one year, 1868, added more than 5,000 miles of wires to its lines—a single item of its resources equal to the entire telegraph system of Belgium. More: In Belgium, one message is sent to every seventh person; in Great Britain, one to every fifth person; in the United States, one to every two and a half persons. The proportion of telegrams to letters in Great Britain is 1 to 121; in Switzerland, 1 to 69; in Belgium, 1 to 37; in the United States, 1 to 22. There cannot be a doubt, except in the "Washburne family," that the people of the United States are more abundantly provided with telegraphic facilities, and use the telegraph to a greater extent than any other people on the earth. What excuse, therefore, can be found for the scheme to shove the government into the business of telegraphing, unless it is to vastly multiply Federal offices to be filled by General Grant's appointments?

The question of the comparative cheapness of governmental and of popular telegraphy, raised by Washburne, can be settled in like summary fashion. The total number of telegrams transmitted in Europe in one year, 1866, was 18,683,000, costing \$15,286,500. Their average cost was 81 5-6 cents. The Western Union Telegraph Company alone, in 1867, transmitted 10,067,768 messages, at a cost to the public of \$5,728,000. Their average cost was 57 cents. In 1866 the Western Union Company furnished the press of the United States with 14,751,181 news messages, at a cost to the proprietors of the papers of \$521,509, or three and a half cents a telegram! That quantity of news delivered to the press alone for \$521,509 was greater than the entire telegraphic correspondence of Continental Europe in the same year, for which the arbitrary and meddlesome governments charged their subjects \$11,507,632. We have before us a list of sixty of the principal telegraph stations in Europe and the same number in the United States, with the tariffs of charges and the distances in air-lines from London and New York, respectively, from which it appears

that the rates from London average more than twice as much for the same distance as those from New York.

But what need is there to accumulate facts of this character? The above should be conclusive. They demonstrate that there is no necessity for, and no justification of, the addition of a governmental system of telegraphy to the wholly sufficient system we now enjoy. The scheme to annex the telegraph to the post-office, which Mr. Washburne is working to engineer through Congress, can have no other practical result than immediately to increase the public expenditures, to add to the oppressive burden of our taxes, to multiply offices to be filled with partisans, and in the end to break down all private lines, and finally to greatly increase the cost of transmitting messages; for the majority of the people—who do yet not use the telegraph, but find the mails sufficient for their wants—would not stand a system of telegraphing for the benefit of the minority which annually presented a deficit of income as compared with expenditure, and drew upon the common treasury for the deficiency.

We protest, in the name of our over-taxed and over-governed people, against this mischievous and wasteful scheme. The publishers and readers of newspapers have a special interest in defeating it. Washburne's bill provides for a general tariff of one cent a word on his government lines, with an additional charge of three cents for delivery, and stipulates that a reduction of not more than 50 per cent. shall be made for press reports. This rate would increase the average cost of news for the press of the United States more than 300 per cent., and would compel the newspapers to submit to a tax of a million dollars a year for the privileges they now enjoy. Of course, there would have to be a corresponding increase in the price of papers and the charges for advertising, or a compensating diminution of the quantity of news received by telegraph. In either way, the public would be largely the losers.

[From the Brooklyn Union.]

### The Government and Telegraphs.

It does not follow that because some Governments have taken the telegraph lines under their control, that of the United States should do likewise. The Governments which we are urged to follow into the telegraph business are "paternal." It is their pride that they take care of their people; that they restrain them from going on too rashly, lift them up when they fall, and give them employment on Government works projected for the purpose when they find them out of work. The Government of the United States does nothing of the kind. It is not paternal. It is based on the presumed capacity of the people to attend to their own affairs and take care of themselves. It regards itself as the agent of the people, to attend to the general affairs which it is commissioned to attend to, and to no others.

The telegraphic business does not come under its commission.

Some imagine that the management of telegraphs by the Government may be legitimised by analogy with its management of the Post Office Department. Not so. The Constitution gives the control of the Post Office to Congress. It says nothing about telegraphs. If the Post Office system had been organized with its ramifications extending as now to every hamlet in the country, and all by private enterprise, as the telegraphs are now, at the time of the adoption of the Constitution, that would have said nothing about post offices. There were no post offices or mail routes then; there was no one but the Government to establish them, and no prospects of there being any one but the Government to do it, for a generation. The people were suffering for the want of them, and the Government was very properly directed to establish them. We have telegraph lines, all that will pay, convenient enough to all settled neighborhoods, and better managed than the Government will ever manage them. It will be folly to transfer them to the Government.

If any fancy that greater responsibility will be obtained by Government control, let them remember when they have a valuable package to send, they forward it, for the sake of safety, by a private express company, rather than by the Government Post Office.

If they think that economy will be subserved, they may remember that while it is the interest of private manage-

ment to be economical, Government management is notoriously extravagant and profligate. While the Post Office Department fails to meet its expenses, the private carriers of mails, whether for the Government or for persons, make large profits. The Government is obliged to affix heavy penalties to independent carriage of the mails, in order to prevent express companies and private parties coming up and taking the Post Office business from it. Even if the Government should manage to reduce the rates to the senders of messages, the difference would be more than made up for in the taxation necessary to supply the deficiencies in the Telegraph Department, as the people have now to supply the deficiencies of the Post Office Department.

If it is thought that new lines are wanted, which the Government will build and private parties will not, it must be thought on the other side that if they will pay, private parties will build them, and if they will not pay, the Government cannot afford to build them.

If the object of the new plan be to do away with a monopoly, that object can be as effectually and more cheaply accomplished by the enactment of a free telegraph bill, giving to any company the right to construct telegraphs where it will upon complying with proper conditions and raising enough money. This will develop legitimate competition and keep prices within bounds.

For the Government to assume control of the telegraphs will be for it to take upon it what does not belong to it, what it cannot manage economically and properly, what will be a source of expense to it, and what will prove a fruitful source of corruption, and entail upon it an army of jobbers and corruptionists, who will grow and fatten upon it as long as it holds on to the telegraphs, or rather so long as they hold on to it, for they will prove a veritable old man of the sea.

### Telegraph Suit Decided.

CHICAGO, January 6.—The Chancery branch of the Supreme Court case affecting the interests of rival telegraph companies, was decided yesterday by Judge Jameson. The questions of the right to use the poles originally erected by the Great Eastern Railroad Company was involved. It was moved in the Court to tear down the wires of the rival companies, but the Court decided only the personal quarrel. The injunction is dissolved, and no injury accrues to either of the companies.

### The Electric Light.

We had occasion to refer to this light at the time of its exhibition on board of the French steamer *St. Laurent* last October, and recur to it again with great pleasure, as it appears that for the purpose of signals in time of fogs, for the use of ships at sea, and for our lighthouses, nothing equal to it has been invented. The principle of induction, upon which our physicists have been at work since its discovery by Faraday in 1830, is now pretty thoroughly understood, and it is high time that a cheap, convenient, and practical magneto-electric machine was invented.

The French machine was sufficiently perfect to be used on the voyage at a trifling expense. It was called the Berlioz electric light, and was, in fact, a modification of the apparatus invented by Clarke. By revolving sixty-four reels of copper wire before forty series of horse-shoe magnets at the rate of three hundred turns a minute, a double current of electricity is induced in the copper wires, the one direct as they approach the poles, the other reversed after they have passed them. In this arrangement no device for breaking the current is required, as it is found that, though the current is interrupted at each reversion, the light is not perceptibly affected unless the interruption exceeds one-twentieth of a second. The apparatus was about five feet square, and required one or two horse power to drive it.

The light is produced by the combustion of two carbon pencils in a reflector. Very much depends upon the regularity with which these pencils are fed into

the flame, and this difficulty was overcome by the late eminent physicist Foucault. He invented a clock-work that runs five hours without winding, and feeds the carbon points exactly in the ratio of their combustion, and there is no interruption in the light.

Another important point is to render the rays of light parallel, so that none shall be lost. This is accomplished by a parabolic mirror placed behind the light, and the effect is further heightened by the use of the Fresnel lens. The power of the light obtained in this way is something remarkable. To produce the same amount of light with an oil-flame, the size of the flame must be two thousand times as large as that of the electric light. The French company claimed that the light was equal to that of sixteen hundred candles, and yet that its cost was only about twelve cents an hour.

The effect of such a concentration of light is similar to the heat effects of the oxyhydrogen blow-pipe; nothing but the most opaque substances can resist it. It penetrates the densest fog, and casts its rays for miles. A gentleman residing two miles from where the *St. Laurent* was lying happened to be on the piazza of his house when the reflector was turned upon it, and he was able to read a book with perfect facility. If our ferry boats carried such a reflector, the pilots could see across the river in the darkest night, and, by moving the apparatus, could sweep the whole horizon, and avoid all danger of collision. While this concentration of light at one point, thence to be thrown by powerful lenses to great distances, is the best possible arrangement for signalling and piercing for fogs, it is not so good where more diffused light is required, and hence the electric light, as well as the oxyhydrogen light, have not been so successful for public buildings as they have been in streets or squares where light is required only to illuminate a certain path. Concentration is wanted for signals, and diffusion for general lighting purposes. It is possible that some of the difficulty could be overcome by a different arrangement of the burners, but, as at present applied, the want of diffusion is a very serious drawback.

### The Pacific Telegraph.

LETTER FROM PERRY M'D. COLLINS.

WILLARD'S HOTEL,  
WASHINGTON, January 2, 1869.

To the Editors of the *Evening Post*:

In your journal of December 26 you publish an article headed "A Pacific Telegraph," in which the "Collins Overland Line" is referred to. As the question of a "Pacific Telegraph" is one which the *Evening Post* has always taken a lively interest in, I desire, through your columns, to state very briefly its present status. That the overland route, or rather that portion left unfinished by the Western Union Company, has been abandoned, is true, but the general proposition of connecting our Pacific coast with Asia has not for a moment been abandoned by me.

Under the grants to myself by Russia, Great Britain, British Columbia, and the United States, more than one-half of the overland line and its connections has been constructed. First, on the American side up to within 260 miles of Sitka, in Russian America; and secondly, on the Asiatic side continuously, except one section on the Amour River, for the construction of which all the materials are now on the ground, on to Europe, across the whole of Asia.

The break in the line, as it may be stated now, exists between a point on Simpson's River, 260 miles southeasterly of Sitka, to a point (Poseyet) on the Asiatic coast, 42° N. L., 134° E. L. from Greenwich, a distance of but about 2,700 miles by way of the Aleutian and Kurile Islands, along which it is now proposed to construct this last link, which will give us a continuous telegraph around the globe.

From Hakodadi, in Northern Japan, it is proposed, in the present plan, to lay cables to Nagasaki and Yokohama, and from Nagasaki to Shanghai, thus uniting China and Japan in the telegraphic system; the distance from Hakodadi to Shanghai, by way of Nagasaki, is about 1,100 miles.

The whole plan is now before Congress, and would have been acted upon at the last session but for the delay in the settlement of the purchase of Russian America.

The route indicated in the article referred to is much longer than the route determined upon in my plan; on the route by way of the islands of the North Pacific there need be no section of greater length than five hundred miles, and that section, if advisable, can be reduced by touching at Kamschatka.

The approaching completion of the Pacific Railroad, and our steamers plying between San Francisco, Japan and China, give us the solution of the Pacific Telegraph; for who can believe that commerce, considerations of national necessities, and American enterprise, will much longer hesitate to provide the chief agent in subjecting the vast commerce of Asia to our rule. With the telegraph completed from our Pacific coast so as to unite with the Russian system overland to India and Europe, connecting Japan and China with San Francisco, we at once divert and direct the whole tide of Asiatic commerce from the West to the East.

With this telegraph London would have to communicate through New York and San Francisco, in order to conduct the commerce of Europe with Japan and China. The ideas, the monetary exchanges, and the daily wants of that vast commerce would become so engrafted upon our own commerce and people, that in the future we would not only command but control the European trade of the East, and reap therefrom what by position and progress is our legitimate right.

Very truly your obedient servant,

P. McD. COLLINS.

#### A Clincher.

M. R. WASHBURNE TURNED AGAINST HIMSELF.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR: In reading the bill proposed by Mr. Washburne in May last for the construction of a Government Telegraph line from Washington to New York, which was referred to the Committee on Post Offices and Post Roads, I perceive that Mr. Washburne bases his calculations, not on the practical workings of the telegraph, but upon figures. He estimates that 2,000 words can be transmitted each hour by a single operator, and that he can work ten hours a day, thus making 20,000 words a day's work for each operator, and upon this estimate Washburne proposes to meet the deficiency in the Post-office department.

Without considering at this time the unconstitutionality of the bill, as such business was no more contemplated by the framers of our Constitution than the building of railroads, or opening stores for supplies; and without demonstrating, as we could easily do, the danger to our institutions of exposing all secret correspondence to the espionage of officials who might use their knowledge to retain their power, a danger which cannot exist under the present system, when all postal communications are under seal, and which it is unlawful for the postmaster to read; we will simply demonstrate the futility of Washburne's argument by facts taken from the Post Office itself.

It is well known that the postal system at present in operation is not only defective, and that letters are not delivered promptly, but that the Government loses money in carrying letters at three cents for each letter of half an ounce in weight. As the Government charges six cents an ounce for all letters and for all written communications, we will base our estimates

of the true expenses of the Post Office on the present established rates of postage, and prove to Mr. Washburne that the present deficiency in the Post Office is owing to the *excessive and outrageous profits made in carrying letters*, and that, as the business will increase with each reduction in rate, the true cure for the present evils is not to violate the Constitution and enter into business of which Government officers have no knowledge, but to reduce the present rate of postage to a proper and just profit.

Now it is well known that it is easier for a man to sort 2,000 letters an hour than to read and telegraph 2,000 words in the same time, especially as all telegrams are filed and numbered in telegraph offices. As Mr. Washburne estimates ten hours as a day's work, each man in the Post Office can sort 20,000 letters daily. Allowing a like time for distribution, a man can sort and distribute 10,000 letters a day, and if his services be valued at \$4 a day, the expense of sorting and distributing letters is *only one twenty-fifth part of a cent on each letter*. Now, supposing the letters to be only half an ounce each (which is the most unfavorable view to take of the matter in regard to profit, these letters would weigh 5,000 ounces, or about 313 lbs.—about one-seventh of a ton. As most letters are written to places within 200 miles of each other, we will, by way of caution against excessive estimates, estimate the average distance at 300 miles. Under our present system, the Government pays freight on letters, on the average, for that distance. At ten dollars a ton for freight for 300 miles, the railroad companies would not lose money, and most freight is carried at less than this rate. Supposing, now, the freight be estimated at double this rate, the Government would pay \$20 a ton for carrying letters for 300 miles. As it takes 64,000 letters to weigh a ton, the actual cost of transportation is 1-32d part of a cent for the freight of each letter. Now, adding the cost of sorting and distributing letters, 1-25th part of a cent, and the cost of freight 1-32d part of a cent, we find the expenses of the Post Office, if properly managed, are *less than one-tenth of a cent on each letter*. Now, at three cents postage on each letter—and much more than that for a large portion of the letters—we find that the Government should realize thirty times the cost of the service performed by it. But, instead of a profit, we find that the Government *loses money*, and Mr. Washburne proposes to make a department which ought to make *three thousand per cent. on its letters*, but loses money by its mismanagement and shameful contracts for mail service, make up its losses by entering into a business which has never afforded large profits under individual management, *even at rates fully treble those proposed by him*. If the Franklin line of telegraph, with a modest capital, cannot earn a dividend, at 40 cents a message, from New York to Washington, how can the Post Office make money at one-third of this price? How can a department that loses money in a business affording 3,000 per cent. profit, make money in a losing business?

The true secret of reform in the Post Office Department is to reduce the rates of postage to one cent a letter, which will afford a modest profit of 1,000 per cent., according to Mr. Washburne's own reasoning; thus we shall stimulate letter-writing, and place the facilities of the Post Office within the reach of a very large class of our citizens, to whom each cent is needful to eke out their necessary expenses. Let us try this course first, and keep the clerks in the Post Office fully employed, and not violate the spirit of our Constitution in miserable experiments, and squander the public money in an undertaking in which individuals dare not venture their own.

J. R. H.

THE more merit a man has, the more does he applaud it in others.

#### A Big Thing.

A few days before the banquet given to Prof. Morse, a gentleman on Wall street, desirous of procuring a ticket, sent to the Secretary of the Banquet Committee to purchase one, giving the messenger twenty dollars for that purpose.

The messenger was a fat, rubicund lad, with a bloom on his cheeks and a sparkle in his eye which a Broadway belle might envy, but he was sublimely ignorant of the Delmonican charges for refreshments, which sometimes stagger banqueteers at that palatial resort of men and women of long purses and dainty appetites. So when "Bob" presented himself for a dinner ticket, he expected to hear back with him a heap of change, and was much surprised at the delay of the secretary in changing his twenty-dollar bill, which his eyes followed scrutinizingly to the drawer where it was deposited.

"Ain't you goin' to give me no change back," at last inquired Bob, as a cloud, half anger, half astonishment, circled round his very open eyes, and the ruby of his cheeks grew deeper.

"Oh, no! my lad," replied the official; "the tickets are twenty dollars each. It is all right."

It took at least thirty full seconds before Bob could believe that he had heard aright, and that it was at all possible that any dinner given to mortal man could command such a price. During these thirty seconds Bob's breath went and came, and his eyes glistened the secretary as if he were the gentlest of all gentle thieves, and he, Bob, the victim of a very polite villainy.

"Twenty dollars for a dinner ticket!" at last he exclaimed in a voice between a sigh and a yell. "By golly, ain't that a big thing for old Morse?"

"What do you mean?" inquired the Secretary, kindling a little at the idea that the banquet was regarded as a speculation.

"Why, nothin'; only ain't old Morse goin' to make a big thing out o' that? It can't cost the old fellow more'n ten at the most, an' I should think it couldn't cost him more'n five. How many are going to be there?"

"About two hundred."

"Golly," exclaimed the now thoroughly excited Bob, after a brief pause, during which he was engaged in an earnest use of the multiplication table to arrive at the product of 200 times 20, "that's four thousand dollars! Jiminy! old Morse'll make more'n two thousand out o' that dinner, won't he?"

The Secretary, of course, endeavored to set Bob right on the gastronomic speculation which had thus burst upon his bewildered vision, and tried to impress upon Bob's mind that Prof. Morse had nothing to do with the money for the tickets, and also explained to him the magnificence and costliness of the banquet for which the Delmonicos were to charge \$4,000. But the idea had evidently stuck, and the blue eyes and the cherry cheeks turned towards Wall street, reading "twenty dollars a ticket" on the Broadway mud, and up on the clock of old Trinity, and on the folds of the flag of Wells, Fargo & Co., and was fully persuaded that the easiest way of making money was by selling dinner tickets at twenty dollars a piece.

EDITOR JOURNAL OF THE TELEGRAPH:

The regular monthly meeting of the Elizabeth, N. J., Y. M. C. Association was held January 25. Several of the clergy and quite a large number of ladies were present. Mr. F. L. Pope, well known throughout the telegraphic community, read a very interesting essay on his travels in British North America while in the service of the Russo-American Telegraph Company. The essay was well received and complimented by several of the members present.

**Another Happy Superintendent.**

PRESENTATION TO COL. JAMES COLEMAN.

The telegraph office on South Court street, where business goes at all times with clock-like regularity and quietness, was the scene of a very pleasant affair on Christmas day, and mirth resounded above the ticking of the telegraph machines. The occasion was the presentation of a splendid and valuable gold watch, manufactured by the celebrated Nardin, costing over four hundred dollars, to Col. James Coleman, superintendent of the sixth district of the Western Union Telegraph Company, by the employees of the office and other friends.

At an early hour in the morning Col. Coleman, who had accepted an invitation to dine with a friend, received a message from John Van Horne, Esq., general superintendent at Louisville, to the effect that he apprehended that there was a conspiracy in the sixth district, and he wished Col. Coleman to be in the office at half-past three o'clock, that he might have an opportunity of "conversing" with him over the wires in regard to it. Col. Coleman was somewhat uneasy relative to the matter, which he could not understand, and he was promptly in attendance at the time mentioned, and notified the Louisville office of the fact. A reply was instantly received from Mr. Van Horne to the following effect: "The conspiracy has burst up and you are in the hands of the kuklux."

Major Will A. Woodson, agent for the Associated Press, then stepped forward and explained the riddle in the following terms:

"Colonel: For nearly eighteen hundred years a good old custom has existed of presenting on this day testimonials of appreciation and affection to those who have endeared themselves to us; and in behalf of the employees and others of your district, allow me to present you this watch, as a token of our esteem and regard for one in whom we have ever found all those qualities which men delight to honor. Take it, sir; and when you gaze upon its truthful face, as it 'checks off' the hours of time, rest assured that there will be no 'error sheets' sent back, and may it serve to recall the memories of those who have united in the offering." [Applause.]

He then handed the elegant watch on which was engraved inside the case the following inscription:

"Presented to Col. James Coleman, superintendent, by the employees and others of the sixth district of the Western Union Telegraph Company. Memphis, Tennessee, Christmas, 1868." The watch was manufactured by James Nardin & Co., is a full chronometer, very heavy cases, and cost four hundred dollars.

Colonel Coleman, who was visibly affected, responded as follows:

"In receiving this beautiful and substantial testimonial of regard from your hands, in behalf of your brother operators and co-laborers of the telegraphic fraternity of my district, taken so suddenly by surprise, I am unprepared to make the proper acknowledgments and give expression to my feelings in the manner in which this handsome honor conferred upon me deserves. But rest assured that I am not insensible to gratitude; and the feelings produced by this unexpected and generous act, on the part of my brothers of the mystic art, is deeply engraven upon the tablets of my heart; and it will always be a source of proud satisfaction and an evidence of the high esteem in which I am regarded by those with whom I am daily associated and who know me best. I cannot say I merit this marked distinction. We have labored together in the cause of our company and the public, and I congratulate myself that there is not a more faithful, competent and gallant corps of men in the service of any department of the telegraph than those in my employ. The public has intrusted you

with the most responsible and delicate duties, and in all of which you have performed your labors and discharged your duties with the most entire satisfaction. Our own relations have always been of the most genial character, and not an unpleasant sentiment has ever passed between us. The public owe you more than most of them are aware. After the toils of the day your labors do not cease. There is not a single night in the year, not even excepting the sacred Sabbath, but your duties summon most of you into the ranks of midnight toil, and while the man of trade and commerce and speculation enjoys the sweet comforts of his home fireside or the delights of repose, dreaming of brilliant speculations, large gains and future bright hopes, you are still at your post, faithful to the trust imposed upon you by him, transmitting to and fro, almost to the ends of the earth, his communications, while all are slumbering in the quietude of night. And yet there is no class of men so poorly rewarded, and whose labors are so little appreciated by the public as the telegrapher, simply because they are ignorant of the obligation they are under to him. You are the representatives of an honorable profession, and of a powerful company with a capital of more than \$40,000,000, and whose wires extend from the Atlantic to the Pacific, and from the lakes to the Gulf embracing a large territory. Still continue to serve your company and do your duty to the public faithfully, and I will always endeavor to promote your interests and welfare. I feel that on this occasion I have a double reason to rejoice—both for the honor conferred upon me by you, and that liberty has been restored to our unfortunate and distinguished citizens who have been so long banished from their native land. I tender again to you my sincere and grateful thanks for the beautiful and costly present; and although of much intrinsic value, the spirit in which it is given enhances its value far beyond price. The remembrance of this evidence of your esteem and friendship shall live forever in a faithful and sincere heart. It is sweet to feel that we have the love and confidence of our friends. I wish you, gentlemen, a most happy Christmas, and in the future many long and peaceful years, and that all the crosses of life will be only 'crosses' of the lines." [Applause.]

**China and the Appliances of Modern Civilization.**

[From the London Telegraph, Jan. 5.]

\* \* \* Were China opened up by railways and spanned by telegraph wires it would, through force of habit, begin to lose its present dread of foreigners, and the danger of attacks on our countrymen would disappear. But many of those even who know China will scout such an idea as absurd. China, the most stubbornly antiquated of countries, echoing with the sound of the railway whistle! The notion might seem as preposterous as the plan of making a railway to the moon. Nevertheless, with all their hatred of foreigners, the Chinese have a keen eye to the main chances. Let them see that a thing is profitable, and, after hesitating for a time, they will use it. Show them that railways and telegraphs will pay, and in the course of a generation the Stephensons and the Wheatstones of the West will have effected a vast change in the Celestial land. Already, indeed, the appliances of modern civilization have done much to shorten the distance between the West and the East. Take one striking example of the fact. Kiakhta is a town on the border line between China and Asiatic Russia. A telegram sent from that town at half-past ten on Saturday morning last arrived at our Foreign Office on Sunday morning. Some time ago it was a boast that, by means of pony mails, letters could be sent from Pekin to Kiakhta in three weeks. But let a telegraph be constructed between that capital and

the frontier town, and London might communicate with Pekin in a single day. Thus our diplomatic agents in China could at once receive instructions direct from headquarters, and the risk of war between the two countries would be proportionately lessened. The great fact, however, is, that the telegraphic agency has at last made its way even into the remote, untraveled wilds of Central Asia, and that the most distant and most thinly peopled countries are obtaining the means of instantaneously communicating with the centres of civilization.

**Indian Telegraph Rates.**

The following official order has been issued:

"From the first of January next, the maximum rate of a message of twenty words from London to Calcutta, and vice versa, will be £2.17 (equal to about \$20). This tariff will apply to eight routes, as follows:

1. By Holland, Austro-Germanic Union, Turkey.
2. Belgium.
3. France.
4. France, Switzerland, Austria, Servia, Turkey.
5. France, Italy, Turkey.
6. Northern Germany, Russia, Persia.
7. Holland, Germanic Union, Russia, Persia.
8. Belgium, Northern Germany, Russia, Persia.

The fourth of the above routes will be especially utilized for Indian correspondence by a convention between the States concerned. The sixth is the promised line of Messrs. Siemens Brothers."

On the issue of this order the government of India issued the following:

"Notify to the press, and bring into operation on October 1, the following new telegraphic tariff for messages transmitted between any two telegraphic stations in India or British Burmah.

1. For every ten words of ordinary English language, one rupee.
2. For every ten words in foreign language, or words of concealed meaning, or in cypher, two rupees.
3. For repeating a message by order of the sender, twice the value of a single charge.
4. Railways and other private lines will charge precisely the same rates, and divide in equal shares the cost of messages passing over more than one line."

The Indo-European traffic has all along been in, to say the least, an unsatisfactory state as regards transmission of messages, and, if not radically remedied, will render reduced rates only productive of increased irregularity and injury.

The Telegraph Department of India has always been worked at a loss.—*Engineering.*

HERE is a veritable communication for the JOURNAL, which we give *verbatim et literalim*. Don't laugh.

EDITOR JOURNAL OF THE TELEGRAPH.

"The story what I am about to relate to not only to my Readers but to my Brother ops that they may be on their guard. I will begin. There is a young man on our line his private signature is 'A' and his call is 'Gd' and he was paying his attentions to a very nice young lady her first name was Emma and one day he popped The question to her to have him and my Readers what do you think she said she said my Boy you are most too young yet you will have to wait a little longer for me to decide that great question This is true for he told me himself 73 OPERATOR

PLEASE answer this question through the columns of your paper. After six o'clock, p. m., I often hear the phrase "Night message," after check of a message. What is it for, and what does it mean?

If you will answer I will be much obliged. Yours respectfully,

E. L. MAIZE,  
Huntingdon, Pa.

Answer: "Night messages" are dispatches which the senders agree may be delivered the next morning, and be sent during the night. These messages are received at lower rates than the ordinary tariff.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, FEBRUARY 1, 1869.

### The Argument.

During the past fortnight a sharp and exhaustive examination of the status of the American telegraph system, and the feasibility of attaching it to the Government as a part of the postal service of the nation, has been progressing before a Congressional committee at Washington. Some of the elements of this investigation have not been over pure. There has been brought into the examination of a subject of the deepest significance to our future, an amount of long-maturing and well-husbanded malice. Even the means taken to perfect the condition of telegraphic property by ascertaining its true condition under the most rigid tests, and under the manipulation of a skillful foreign engineer, for the purpose of immediate rectification, have been used to prove the still existing condition of all such property. All this proves the existence of a hostility inconsistent with the dignity of legislation, and yet is the sure proof to us that a project which has to resort to such aids, must be powerless in accomplishing its purpose. A false argument is either the offspring of a weak mind or of a false purpose.

The range of evidence, however, has been wide, voluminous, and interesting. The spread of information thus obtained will so reveal the telegraph system, its rapid spread throughout the world, especially in our own land, its efforts to adapt itself to all public and social necessities, the variety and sublimity of its mission, as to render it more than ever a recognized necessity of our advancing civilization. The logic of the facts presented by the telegraph companies has been sharp, overwhelming, unanswerable. Even with a somewhat extensive knowledge of the main arguments in this investigation, we have been surprised at the complete demonstration which the naked, unaided facts of the case has given. These evidences we will from time to time furnish our readers.

Aside, however, from all the figures which have been given, a deeper consideration has urged our resistance to all governmental interference with this and kindred enterprises. The centralizing desire, of which this movement is but an evidence, is the legitimate progeny of the late war. Power in the Government during that conflict was a necessity, and its use sharp, arbitrary, unsparing, was acquiesced in and demanded. But its display, even after war had ceased, dazzled and captivated the public mind. It was a transient worship of that which might easily have established a despotism which would have sucked the national blood from all its arteries, and made Washington not only the regulator but the absorber of enterprise. Nor was it to be expected that men which the war developed, patriotic enough, but instinctively enamored by foreign tour with the displays of imperial power, should at once lose the taste of the sweetness of dominion, and be content with the limits which universal peace point out as the safety of a healthy and free government. Yet in these very limits, especially as applied to the development of popular enterprises, are bound up the destinies of this great nation.

Herbert Spencer says: "While representative government is, by its intrinsic nature, better than any other for administering justice or insuring equitable relations of citizens to each other, it is, by its intrinsic nature, worse than any other for all the various additional functions which governments commonly undertake. To the ques-

tion, 'What is representative government good for?' our reply was, 'It is good, especially good, good above all others, for doing the thing which a government *should* do. It is bad, especially bad, bad above all others, for doing the things which a government *should not* do.'

"To this truth we may add a correlative one. As fast as a government, by becoming representative, grows better fitted for maintaining the rights of citizens, it grows not only unfitted for other purposes, but dangerous for other purposes. In gaining adaptation for the essential functions of a government, it loses such adaptation as it had for other functions, not only because its complexity is a hindrance to administrative action, but also because, in discharging other functions, it must be mischievously influenced by class bias. So long as it is confined to the duty of preventing the aggressions of individuals on each other, and protecting the nation at large against external enemies, the wider its basis the better; for all men are similarly interested in the security of life, property, and freedom to exercise the faculties. But let it undertake to bring home positive benefits to citizens, or to interfere with any of the special relations between class and class, and there necessarily enters an incentive to injustice. Therefore do we say that *as fast as representation is extended, the sphere of government must be contracted.*"

These sentiments are our own. We believe in the old democratic motto, "That government is best which governs least." We protest against an interference with popular enterprise which must, in the nature of things, injure both government and people. Especially do we resist that which, if assented to, would be an admission that the purity of representative government is less dear to us than the mere cheapening of a commodity which must, by the pressure of public opinion, and the general relation of other values, sooner or later find its true status and limitation.

### Ocean Telegraph Projects.

It is always obnoxious to object to a public undertaking which promises general advantage, and yet there are not unfrequently, questions of right and public propriety involved in the fairest and most philanthropic schemes, which claim consideration. There are many things puffed to apparent success by paid advertisements, which have in themselves merit, which as simple proposals challenge approval and support, yet, which may be so related to other considerations as to render them essentially vicious and full of harm.

Here, for example, is a company which asks permission to land a cable on the shores of the United States to connect directly with Europe. Connection with Europe is desirable, as are all plans to unite nations together in the strongest and friendliest bonds. It seems a surly thing to object, yet see how it places the American people. The company who thus asks permission to land a cable on our shores, has already secured a monopoly of the shores of France, so that a simple grant of the privilege of landing a cable on the American shore, is, in fact, the grant of a monopoly of cable communication between America and Europe. Are we ready for so one-sided a scheme as this? If grants are to be given to foreign organizations, let these, at least, be reciprocal. The grant given to Europe to connect with America, should be met with like grants to lay American wires on the shores of Europe. We suspect that our telegraphic philanthropists will find this a harder diplomatic feat than they are willing to admit.

There is another consideration which it is obnoxious to urge, however true in itself, and however fair as between man and man. Here is the Atlantic cable, which after immense labor and a heroism of hope and perseverance which has challenged the admiration of the world, has been successfully laid. Has this investment of brain, and courage, and money no claims upon public protection? Is the solution of the problem of sub-atlantic communication at such a cost to be rendered unremunerative by the schemes of foreign capitalists, or by an unjust public sentiment? We know how weak such an argument always appears. Nothing provokes a reader laugh. Yet there is a justice in even this. If the product of inventive genius secures from Government seventeen years of absolute protection to enable the inventor to obtain remuneration for his skill, why should not the courage and daring and

skill which has performed the largest service of the century, at immense cost, and at so great hazard, be equally protected? We may provoke a smile by the proposal, yet we make it in full view of all that it demands and means, that Europe and America grant to the existing cable company, under distinct requisitions as to its liberal management, the same protection which would be accorded to any inventor in any civilized country for the product of his brain. If this would not be justice, we would like to know why? If the inventor of a rat trap or a washing machine, or the concocter of some villainous pill is protected for seventeen years in his invention, however useful or devilish, why not protect that which the world acknowledges a blessing to mankind.

The circumstances connected with this enterprise render these views of public justice increasingly impressive. For nine years the land lines built to meet the cable paid no dividend, and were maintained at great expense. The Atlantic Cable Company up to this time has not divided more than nine per cent. Its annual income cannot now be stated as exceeding six per cent, regard being had to contingencies and provision for accidents. Common justice seems to demand that such protection be given to those who have invested so largely their means in this international enterprise as shall render their property of reasonable value, and induce the use of capital in other schemes of public utility.

One thing at least should be done, and must be, if right is to govern legislation. If any concession or privilege be granted to a new enterprise, which confers shore rights on a part or the whole of the American coast, the same privilege should be granted to the pioneer company upon whose experience these new enterprises are undertaken.

### A Day of Rest.

The N. Y. Times, commenting on an article in *The Liberator*, which urges the Jews to transfer their Sabbath from the seventh to the first day of the week, forcibly says:

"Best being the great cardinal idea on which Sunday is based, it is and should be doubly prized by us overworked Americans. Already, the nerves and brains of our people are taxed beyond endurance. On every hand, we see frightful evidences of this in the increase of paralysis, insanity, attenuation, nerve disease in every form; we see our people, as they get into the harness of life, abandoning all relaxation and amusement, or plunging into it, if at all, in the excitements of wine, gaming, horse-racing, &c., &c.; and we see, as a matter of course, men and women wrecks at forty, or lying fast asleep 'under green bedclothes,' their work and their lives but half done.

"Now whatever views men may have about the proper observance of this divine day, whether they advocate the practices of Catholic Rome, or Puritan Boston, all will admit that it ought to be a day of rest. We hold it to be a vital thing, a reviving and renewing of life, that all our people on this one day of seven—even if they do not go inside a church—lay aside the plow and the hammer, drop their buying and selling, shave and wash and dress themselves decently, walk about with their families, read their books or newspapers, and thus thoroughly change the drift of their thoughts as well as their occupations.

"We believe this is a vast benefit, inasmuch as it secures a relaxation of the tension of daily toil and speculation, even if it does nothing more; and we know that this rest of one day in seven is a most important fact in securing health to our people."

[Note] We would be glad if it were possible to have every man and woman connected with the Telegraph in full enjoyment of an unbroken Sabbath. We know that there is a desire which we trust to see more executive manifest, to limit as much as possible the service of that day, by restricting the hours during which the offices are accessible to the public. The public interest and the claims of humanity seem to require that during some period of the Sabbath the telegraph be accessible. We ask that no man be needlessly employed on that day, and that the time of service to those on duty be as limited as possible.

### Married.

On the 12th inst., at St. John's Church, Toledo, O., by the Rev. R. High, Rector, E. P. Wortman, Esq., operator of the Western Union Telegraph Company, to Miss M. J. Hazard, all of Toledo.

## Opposition Lines.

Every now and again an interested inquirer drops in, who, after the opening civilities are over, introduces the subject of the telegraphic future, with an evident eye to the sanity or insanity of buying stock at current rates.

"Ain't this a good time to buy?" said an anxious-eyed man to us a few moments ago.

"Buy what?" was our innocent reply.

"Why, Western Union stock; don't you think it cheap at 36?"

"Yes, of course it is, it is really an investment drawing 11 per cent., and in a business which can scarcely fail to be permanent."

"But don't the opposition lines hurt you? They say they are doing a heavy business."

"Oh, bless you, no," we replied, blandly. "Opposition lines are useful things, they sweeten the temper of a great many people; they are a kind of safety valve for the grumblers, and act much like rough flannel on the skin in cold weather, they keep us alive, keep the blood up, you know."

"Ah, my friend," responded our less sanguine visitor, "but don't they bleed you badly? don't you think you ought to choke 'em off some way, and make a sure thing of it?"

"Tut, tut, tut," we replied paternally, "there is no need of choking; besides it is not orthodox, you know. The only way is to mind our business, get our tariffs all equalized, as we have been doing, grease the wires well, and, don't you see, our business increases every year?"

"Well," persisted our pertinacious visitor, "they must hurt you some any how, and I guess I'll wait and see before I buy."

"A very safe course, indeed," we replied, and which we commend to all doubters, "let every thing alone which is not like the moon, the only thing of the kind in the market. And don't forget, there's stars round the moon, and they may grow."

A little irritated at our frankness, our visitor drew up somewhat closer, and inquired very softly—

"Now, do you know what these fellows are doing, any how? If you do, tell me, won't you?"

"Certainly, certainly, here it is all plain as day, and we handed him the following statement, showing the receipts of the Atlantic and Pacific Telegraph Company to have been about 1½ per cent. of those of the Western Union Telegraph Company for 1868, and a balance, which, deducting dues, may be regarded as nil.

## ATLANTIC AND PACIFIC TELEGRAPH COMPANY—REPORT FOR 1868.

## RECEIPTS.

The amount of money received and due from all sources in the operating department, from January 1, 1868, to same date 1869, is..... \$106,891.20

## EXPENSES.

Paid other lines.....	14,442.25
Office rents, salaries of operators, messengers, lights, fuel, etc.....	55,482.81
Construction (loss, etc.).....	4,225.69
Extra instruments, stationery and equipments.....	3,691.22
Salary of inspectors and expenses.....	2,324.47
Changing location, reconstruction and repairs.....	9,057.83
Extra battery.....	1,801.15
Bonus on rents.....	735.94
Taxes.....	2,167.38
General office expenses.....	5,242.41
Division superintendents and their line expenses.....	3,383.56
Office furniture and fixtures.....	1,859.92
Profit and loss.....	213.90
	<b>\$104,628.53</b>

Balance on hand..... \$1,262.67

"That looks as if they hadn't made much, eh?"

"Not very."

"Well, I reckon I'll buy 100 shares, any how," said our departing guest, and away he posted to Wall street to get his 100 shares, and is very gratified to see Western Union on the rise.

## China Advancing.

The news from China shows that the old exclusive empire is advancing with the age. The Burlingame mission and the manner in which it has been received are producing the best effects upon the Chinese Government and people. Steam and the telegraph will do much more. It is surprising to see how the former exclusive regulations and intercourse with regard to foreigners are breaking down one by one. The Yang Chow affair has been settled satisfactorily, and the Chinese Government, under the liberal policy of Prince Kung, has proclaimed freedom of action and protection to foreign religious establishments, missionaries and travelers. Americans are working at the Chefoo gold mines as freely and as safely as they could in their own country. Evidently an extraordinary revolution is going on in China. Now is the time for our enterprising citizens to extend their inventions and trade with the empire, and for the East India Telegraph Company and the Pacific Telegraph Company to lay their cables to China and along its coasts. Looking at the liberal disposition of the Chinese Government, there appears no reason to doubt that concessions would be made for telegraphs in the interior if the concession already granted for a line along the coast to connect the principal cities and seaports were carried out. Now is the time for American enterprise to get a strong foothold in that rich and populous empire.

The aids asked to carry out the extension of the telegraph from our Pacific coast to India we hope will be speedily granted. We shall be glad if the year 1870 finds Asia and America bound by the same ligaments which now unite us to Europe. It would be a wondrous epoch in the world's history if on the 4th of July, 1870, or even 1871, Gov. Curtin should repeat his banquet oration in Yeddo, and in long isolated Japan tie the knot which would complete the girdling of the world.

## Telegraph Beggars.

We have already noticed the project of Hall & Co., a firm hailing, we think, from Boston, to build a line of iron poles from Boston to Washington on which to erect a cable with numerous conductors, to enable them to do which they asked special governmental privileges. But we did not know until we read the following brief announcement that this modest firm had asked the favor of getting their material from Europe free, after getting foreign manufacturers to make their cables and machinery and supply them with all they needed, to the neglect and injury of our own workmen. To be sure nothing can be got without asking for it, and Hall & Co. may think that their virtuous enterprise may induce a suspension of the tariff in their favor, perhaps, even, that a national ship may be detached to transport their European poles and cables; but we think Major Tillotson, now that he has got through with the great Erie ball at Turner's, and seen all his fair guests—those "angels dropt from the sky" of which a juvenile Jenkins writes—safely home, will scarcely permit this to be done without a stout remonstrance. We beg to inform Messrs Hall & Co. that Major Tillotson is a man of many inches, and don't sleep long when the enemy is around. Yet we have no idea that any such absurd permit will be given for any such purpose.

## "TELEGRAPHIC MATERIALS."

"Mr. Brooks presented a petition of Messrs. Tillotson & Co. against the petition of certain telegraph companies to import duty free all the materials necessary for the construction of telegraphs."

While we are thus speaking of Mr. Tillotson we can not avoid scissoring a paragraph out of the *Sun*, in which the aforementioned Jenkins describes with the most sublime enthusiasm the recent "Erie" banquet at Turner's Station:

"Among the gentlemen present, Mr. L. G. Tillotson figured most prominent. He was one of the prime movers of the affair, and was in his glory at the success of the entertainment. He was here, there and everywhere; now entertaining some beautiful partner with his peculiar grace; then entertaining a circle of 'auld acquaintances' whom he discovered present."

## The December Statement.

We are sorry to be obliged to omit the usual official monthly statement of the business of the Western Union Telegraph Company, the accounts from some distant offices not having been received by the Auditor at the time we go to press, so as to permit its completion. We shall give it in our next. Meanwhile, we may say that the business was as good as the average of the previous months, indicating a healthy state of activity throughout the country.

## Telegraphers' Mutual Life Insurance Association.

The following assessments reached us too late for acknowledgment in our last issue. We are glad to inform the association that the response to the last call has been prompt and general, only twelve of the whole number having failed to remit. Of these twelve, some have gone to distant parts of the country and could not be notified, while a very small number have defaulted without some good reason.

The association is to-day on a better basis than ever, and it is expected that upwards of a hundred new names will shortly be added, which will make its membership about 500:

W. J. Purdon,	D. H. Fitch,
Fred. C. Gay,	Geo. W. Lee,
Josiah A. Cure,	James A. Allan,
John H. Cochran,	John C. Sullivan,
H. L. Smith,	J. C. Hamley,
W. H. Allen,	N. H. Browne.

## A Timely Book.

We are not a little pleased to know that in about one month from this date, a book, entitled "The Modern Practice of the Electric Telegraph," will be published. The author is Frank L. Pope, widely known as a clear-headed, practical, educated expert. He has devoted to the work great labor, has illustrated all his topics which were susceptible of it, by elegantly executed engravings or cuts, and has followed exhaustively, in his usually clear and succinct style, the whole of the practical telegraphic operations—the machinery, building, modes of testing and discovering faults, the care and use of batteries, and every practical point connected with the business which an operator or amateur desires or needs to know. We do not say too much when we claim an obviously existing necessity for just such a book, and we think we do not err in claiming for Mr. Pope abundant fitness for the task he has undertaken, a part of which has been placed for inspection in our hands.

The evident need of a manual so clear in its directions for the performance of telegraphic service, has induced the determination to issue, at once, a large edition, no doubt being entertained of a prompt and large demand. It should be in the hands of every operator, and no manager can afford to do without it. Its treatment of the modes of locating obstructions alone is worth more than the price of the book. Lines are now to be under more vigorous inspection than ever. The English regulations for testing are being applied here, and valuable machinery has been imported for carrying out a thorough use of the best modes for rendering our wires of maximum efficiency. This book will be a most valuable companion and guide, and has our cordial wishes for its success.

The price of the book will probably be \$1.25, and which we will furnish to all who desire it. To aid its circulation, we offer to send for five new subscribers, and a remittance of \$5, a copy of the "Modern Practice" free. As a digest of existing knowledge of the telegraph system, free from all technical mysteriousness, we urge an immediate order for so useful a book.

We are requested to direct the attention of every office to the Tariff Circulars issued semi-monthly, and to request that immediately on the reception of the JOURNAL the proper entries be made. There can be no uniformity unless this is faithfully and regularly done.

YOUNG AMERICA.—Who will not sympathize with the young gentleman of three years, "a child of freedom, whose home is with the setting sun!" His mother writes that mosquitoes and sand-burs are many in number and copious in size in her locality. One day her little man, while rambling out of doors, managed to get one of the before-mentioned burs inside the rear portion of his little pants. Running into the house, and holding the minute unmentionables as far as possible from the person, he cried out: "Oh, mamma, I's dot a skeetie bite in my—my—back room!"

# Journal of the Telegraph.

## The Electric Ball.

The telegraphers of this city gave their annual ball at Ferrero's Apollo Hall last evening. The ballroom was crowded with a most fashionable and select party. The electric ball is always one of the best given in this metropolis, and those who attend it never go away unsatisfied. All the directors, presidents, superintendents, operators, clerks and not a few of the old messenger boys were present enjoying themselves. The music was by Wallace, and consequently Offenbach had a good show in the dancing. Mr. William Orton, Dr. Green, Mr. McAlpine, Judge Palmer, General Lefferts, Mr. G. B. Prescott, Mr. John Horner, Mr. William Hunter, R. H. Rochester and a number of other leading telegraph men were present. Many of these gentlemen had their families with them and the whole arrangement was a happy and successful one; perhaps, the most enjoyable of any yet given. The party broke up at a seasonable hour, and next morning every man was at his post sober.

The following were the Committees:

### RECEPTION COMMITTEE.

M. H. Redding, Chairman.

Waldo H. Collins,	John C. Stewart,
Walter O. Lewis,	M. S. Roberts,
Joseph L. Edwards,	Thomas T. Dennis,
Alfred S. Downer,	William H. Clarke,

Robert M. Mattocks.

### FLOOR COMMITTEE.

John B. Oltman, Director.

Martin K. Tompson,	A. H. Watson,
Horace C. Fardon,	Jos. W. Burnham,
W. C. Chapman,	Edward Gordon,
Geo. W. Roberts,	Harry P. Jones,
Geo. K. Walcott,	Jere. G. Case,
Thomas Brennan,	John McKeachie,

Frederick C. Gay.

### MANAGERS.

Waldo H. Collins,	M. H. Redding,
John B. Oltman,	Martin K. Tompson,
	John C. Stewart.

## Delaware Asserts Her Authority over Telegraph Cables Landed on Her Shores.

WILMINGTON, Jan. 27, 1869.

The State Legislature has adopted a joint resolution declaring the authority of the State over the landing of ocean telegraph cables on its shores, alleging that the Atlantic coast of Delaware is peculiarly favorable for the landing of the French cable, and appointing J. P. Comegys a commissioner to confer with the company forming that enterprise.

The Postal Committee has notified parties interested *pro* and *con* that all debate on the Postal Telegraph must end on Tuesday next, when the Committee will give it a final hearing.

## The French Cable.

WASHINGTON, Jan. 28, 1869.

The French trans-Atlantic Cable Company will ask to be heard to-day through counsel against the adoption by the Senate Committee on Foreign Relations of the resolution referred to that Committee, which requires the consent of Congress before any foreign sub-marine cable can be landed in the United States.

They propose to lay their cable the coming summer, and declare that the present resolution is in the interest of the Newfoundland and Valencia line.

The first instalment of the French cable—125 miles in length—which will be stowed in the fore tank of the Great Eastern, has arrived at Sheerness in the hulk Iris. The testing-room for the use of the electricians is to be placed on the upper deck, and its construction is in a forward state. A sufficient length of the core of the cable (to be used for testing purposes) has been supplied on board, and workmen are busily engaged fixing it ready for connection with the instruments.

## TARIFF BUREAU.

### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
FEBRUARY 1, 1869.

To all Offices on W. U. Lines:

The following changes have occurred since January 15, the date of the last tariff order. Please note them in your tariff book:

### NEW OFFICES.

Carroll, O., tariff same as Columbus, O.  
Canal Winchester, O., tariff same as Columbus, O.  
Sandy Hook, Md., tariff same as Harper's Ferry, W. Va.  
West Point, Ark., tariff same as Augusta, Ark.  
Clearfield, Pa., } Tariff as follows: Offices between Erie and  
Phillipsburg, Pa. } Scranton on the Philadelphia and Erie, and Lackawaxen and  
Bloomsburg Railroads will add 40c. to their rate to Lock Haven, Pa. Offices between Pittsburgh and Philadelphia on Pennsylvania Railroad same as to Bellefonte, Pa. All other offices will add 50 cents to their rate to Harrisburgh and Pittsburgh, or 60 cents to their rate to Philadelphia—taking the lowest rate. Offices having "Special Sheet A" will use reduced rate to Harrisburgh, Pittsburgh and Philadelphia in computing rate to Clearfield and Phillipsburg, Pa.

### OFFICES CLOSED.

Berlin, Md., Harper's Ferry, W. Va. Business for Harper's Ferry will hereafter be checked to and delivered from Sandy Hook, Md.

### GENERAL INFORMATION.

On and after February 1, the charge from London to Spain will be (20 words) - - - - - \$1 75  
Portugal and Italy, (20 words) - - - - - 2 00  
For each 10 or fraction of 10 words beyond the first 20,  
- - - - - One-half rate.

Explanation has been asked as to what is meant by "sending by cheapest route," or "taking lowest rate."

We explain by taking, for example, the directions given above for finding tariff to Clearfield and Phillipsburg, Pa., and supposing your rate to Harrisburgh to be 50 cents, to Pittsburgh 40 cents and Philadelphia 60 cents. The rates given for Clearfield and Phillipsburg are 50 from Harrisburgh, 50 from Pittsburgh and 60 from Philadelphia. Adding these to your rates we have 90 cents via Pittsburgh, 100 via Harrisburgh and 120 via Philadelphia. The rate taken will be 90 cents, it being the "lowest rate" or the rate showing "cheapest route."

The tariff to Madison, Wis., is given in JOURNAL of October 1, 1868, as 50 and 3 from Milwaukee; it should be 40 and 3.

Becancour, Ont., in list of Montreal line offices in JOURNAL of January 1, should read Becancour, Que., and Willeley, Mass., in same JOURNAL, Wellealey. Phillips, Mo., in JOURNAL of January 1, should read Phelps, Mo., and Alden Creek, N. Y., in last JOURNAL should read Alder Creek, N. Y.

WILLIAM ORTON, President.

## Banquet Letters.

OMITTED IN OUR LAST NUMBER.

2 PARK STREET, Boston, Dec. 24, 1868.

Messrs. C. W. FIELD and WM. ORTON:

GENTLEMEN—I have had the honor to receive your invitation to be present at a banquet to be given to Prof. S. F. B. Morse, LL.D., on Tuesday evening the 29th inst., and deeply regret that my engagements make it absolutely impossible for me to enjoy the pleasure of being present on so interesting an occasion.

It will be impossible for me to say any thing new on the great subject of telegraphy—the leading marvel in an age of marvels, and I shall not attempt to do so. Certainly it is conspicuous among those great agencies and institutions of our times which have so contributed to the advancement of humanity, and which have rendered Republican Government on a wide scale, not only perfectly easy and simple in its workings, but almost indispensable to highly civilized states in the future.

Nothing would give me greater pleasure than to assist in doing honor to one who has been so foremost and distinguished in this great science as Professor Morse, and I must, therefore, beg you to accept the expressions of the deep regret which I feel at my inability to attend, and of my sincere thanks for the honor of your invitation.

With great regard and respect,

Pray believe me very truly yours.

J. L. MOULT.

## DURANT'S

### NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 4, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

### SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

### RAILWAY TELEGRAPH OFFICES.

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

### THE BUNNELL REPEATER.

by the use of this Instrument, is rendered practically self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

### THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

### MADE INTERCHANGEABLE.

so that a duplicate of any portion can be furnished at any time. The ordinary resistance of this Relay is equal to about Twenty five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

### THE USUAL DISCOUNT TO DEALERS.

Mr. Gerrit Smith, chief operator on the Eastern wires in the Western Union office, 145 Broadway, New York City, makes the following statement in regard to this instrument:

"As far as I have been able to notice the working of Mr. Charles Durant's Relay, which has been experimented with in this office for several weeks past, I have no hesitation in pronouncing it in every respect fully equal to the claims of its inventor, 'A Self-Adjuster.'"

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868. Address all orders to

CHARLES DURANT,

Office and Factory 38 Nassau Street,  
New York City.

## Telegraph Lines.

BY R. W. O'BRIEN.

You may talk of discoveries new,  
Improvements, inventions and skill,  
How potent a compound is formed  
Of number one brains and a will;  
Of your steamers, abounding in life—  
Resisting both tempest and squall—  
Of your railroads—and other roads, too—  
But the telegraph masters them all!

What though your prow cuts the waves,  
Unaided by oar or by sails;  
What though the iron horse flies,  
With an arrow-like speed o'er the rails;  
The monarch of steam is surpassed—  
Is distanced in all his designs—  
And even the iron horse, too,  
Is checked by the magical lines!

They stretch over Asia's dominions,  
O'er Africa's desolate sands,  
And Europe has "line upon line"  
Throughout all her populous lands;  
From the rock-tow'ring cliffs of Gibraltar  
To the shore where the Arctic surge rolls—  
Not even the Czar can prohibit  
This continual rising of poles!

How the cynical scoffed at the cable,  
And thought it a joke mighty rare,  
To call it a Yankee contrivance  
Because 'twas AN OCEAN affair;  
But now, with the continents talking  
'Neath miles of tempestuous brine,  
We'll tell them this great correspondence,  
Resulted from "dropping a line!"

Then success to the knights of the magnet,  
The heroes of spark and of click,  
The only known persons who prosper  
Transacting a business "on tick!"  
Here's the motto inscribed on their banner,  
Which now to the air is unfurled:  
"Our lines have gone out through the earth  
And our words to the ends of the world!"

## Sound Telegraphs.

JANUARY 22, 1869.

FROM JOURNAL OF THE TELEGRAPH:

The article entitled "Still another Telegraph," in your number of the 15th inst., reminds me of an old idea of mine, regarding the manner in which speaking tubes may be very much improved, as their genuine merit deserves they should be. In the present way of arranging the tubes, it is seldom that more than two openings or mouthpieces are placed on the same length of pipe; and this is necessarily so, for if there were more, the puff which proceeds from the sending station would sound the whistle, and thus draw the attention of all of the other stations to what concerns but one. To be sure, this is avoided by agreeing upon a code of whistles, but the additional skill and harsh noises thus necessitated are by no means desirable in any place, and decidedly objectionable in counting houses, salesrooms and the like.

I would propose a single main tube running perpendicularly from the principal station to the top of the building, each floor having a branch tube entering through the rooms, with mouthpieces attached as desired. At each speaking place, answering in *lingua telegraphica*, to "office," to be placed an ordinary Morse sander; or in situations where greater elegance of tone is desirable, a small electro-magnet gong. The instruments to be connected by wire and worked by the proper amount of battery; their use would be, to call the attention of the party needed, and do away with the horrible shrieks of the whistles, while in being un limited in number, they would possess a sterling advantage over the whistles; which can not be multiplied indefinitely, or even indeed to any considerable extent.

By an arrangement of valves, which will at once indicate itself to the reader, the party who is called,

knowing who wants to speak to him, may close all the various openings in the tube between them, forming, as it were, but a single tube, and leaving all the rest of the unoccupied pipe to be used if needed by other stations beyond; while at the same time he shortens the tube, and renders the talking easier and plainer.

To those who have never thought of the matter, a proposition such as this may seem of small importance, but having seen evidences of the difficulties experienced and expenses attendant upon attempts to secure efficient communication between the various parts of large buildings, I am by no means willing to so admit it. I have in my mind one of the largest mechanical establishments in the country, where it was endeavored to connect the headquarters of the different foremen with the drawing office, by means of an electric telegraph, using the Morse register; and I have also in my mind the disastrous and expensive failure which a little thought might have predicted. The advantage of tubes for rapid and efficient communication are too plain to need demonstration, but the difficulties of connecting properly the extreme portions of an extensive edifice, without an undue multiplication of tubes, have been unsurmountable. With the system proposed, I am vain enough to think, these difficulties vanish; and as no trouble whatever may be expected from distances (Biot having found it possible to converse in a low voice, with a friend 3,120 feet distant, through empty water pipes in Paris), I have hopes of its adoption, and should be happy to elaborate my plan to any one desiring it.

I am quite sure, however, that no danger to the electric telegraph may be expected from the sound telegraph of Mr. Vaughan of London, which, indeed, unless it be arranged very differently from the manner stated, will meet with no success at all. "Wires free from insulation, whether conveyed beneath the earth or under water," will not transmit sound to any distance, for the precise reason that an electric wire would fail in such cases, the leaking of the vibrations from the conductor. Sound is nothing but a series of pulsations or waves which make themselves sensible to us by their impact upon the tympanic membrane of the ear, and then by an exquisitely beautiful arrangement to the brain. The waves having to traverse greater or less distances, according to the density of the medium through which they proceed, we are prepared to understand that sound will travel fastest in densest bodies, and that its velocity in water is four times, and in iron about seventeen times its velocity in air. Although the sound to be transmitted though the wires would lose but little of its intensity, by escape to the rarer atmosphere, it would be altogether lost, in a comparatively short space, if the earth or water be substituted; while the same thing would result through the supports or poles, if strung through the air like our ordinary lines.

The transference of sound, and its reappearance at a distance, was illustrated by Sir Chas. Wheatstone, by what is probably the most beautiful illustration at the means of the lecturer on this part of science. Resting upon the sound board of a piano, placed in a room beneath that in which the lecture was delivered, was a wooden rod or pole, which, passing through without touching the floor, had on its upper end a thin wooden board or frame, similar in design to the sound board of the piano. Upon the piano being played by an operator, the sound, traveling through the rod, distributes itself to the thin board on its upper extremity, whose delicacy and larger surface enables it to transmit the musical notes to the air; and in this manner the most difficult and beautiful pieces of music may be made to sound from a wooden board. The effect being enhanced by the removal of the board, when the music ceases, to be renewed when the board is replaced. The cause of the cessation being the inadequacy of the rod, because of its small surface, to

set the air in motion. But, beside the escape, a sound can never compete with an electric telegraph, for the reason that sound moves too slowly. Through the air sound is propagated, the temperature of the air being 32° Fahr., but 1,092 feet per second; through iron wire at 68° Fahr., 16,130 feet; and through copper wire, at the same temperature, but 11,666 feet, while galvanic electricity is speeded with a velocity of from, probably, 30,000 to 50,000 miles in the same time. To send a single sound from New York to Philadelphia, would thus require half a minute, and proportionately with greater distances, electricity being, to all practical purposes, instantaneous.

It is impossible to substitute for electricity any other physical force than light, which being probably but a different sort of motion in the ether than electricity, is the only one save gravity comparable with it in velocity.

Respectfully,

A TELEGRAPHER.

## Self-Closing Key.

Here is another device for insuring the closing of keys, which is worthy of attention. The use of the foot is natural and easy, while the hand is left at entire liberty. It came to us accompanied by the following note:

HUNTINGDON, Carroll County, Tenn.

DEAR SIR—I enclose you a rough sketch of key-closer which I have used for some time and find to answer the purpose very well. Also, a ground wire which has never given me any trouble. The cost of the attachment is nothing but the time and trouble, as any operator with an ordinary amount of ingenuity can put it in himself in a few minutes.

I do not write under the impression that I have discovered the "North Pole" or a "Mare's Nest," but because requested by several old operators who expressed themselves pleased with its working qualities.

Yours, respectfully,

F. O. HARRIS.

The sketch needs no description. A rod is connected with a spring treadle, which, when depressed by the foot, keeps the key open. When the foot is removed the rod bears against the back end of the key and closes it. Nothing can be simpler. The device for a ground wire we are not so sure of. A is a drop covered with tin, hinged at the top and the wire made to pass on either side. To this a ground wire is attached and connection is made by the pressure of the knee. This part of the device looks like an aid to laziness. The other is good.

A music dealer in Nashville, Tenn., transmits music from the top floor of his new building to his store by means of wire—music by telegraph. He expects to locate a string band in his store, and, by telegraphic means, play there for the accommodation of balls which may take place in any of the country towns. What won't people try to do by telegraph?

## Miscellany.

## Christmas Carols.

Here is one of our Christmas clippings which the Banquet crowded out:

In these latitudes the air of Christmas seldom echoes the old carols; and yet there are many of them pleasing in melody, and in sentiment quaint and touching. The French call them "Noels," a term which they also apply to Christmas itself. In fact, the word was anciently used as a cry of applause, much in the same way as we now shout "Bravo." The derivation of the word "Noel" is uncertain. Burney, in his "History of Music," asserts that it is a corruption of *natalis*. It seems more probable, however, that it is derived from *nouvelles*, tidings, news—especially as we find that Chaucer and the old English writers spell it "nowell." All the noels or carols turn upon events connected with the nativity of Christ; and in some the treatment of the subject borders on the grotesque. In one of the "Burgundian Noels" of Gui Barozai the account of the salutation is excessively quaint. The angel addresses the virgin with all the refined courtesy of a Fifth avenue exquisite:

Po lai fenetre el antri  
Et peu de quelque distance  
Al li fi lai reverance  
Car el eto ben epri  
Del vo gar, mai chere amie  
Diti d'ene douce vol.

"Having entered by the window, he came within a short distance of the lady, to whom he made a profound bow, for he was much smitten. 'God you guard, my dear friend,' said he, in a sweet voice."

In many of the English carols the entire progress of this great drama is, with daring poetic license, arranged on board a ship!

There comes a ship far sailing then,  
Saint Michael was the steersman,  
Saint John sat in the horn;  
Our lord harped, our lady sang,  
And all the bells of heaven they rang,  
On Christ's Sunday morn.

But generally the carols give the circumstances of the nativity substantially as they are found in the Gospels—though with such quaint touches and additions as the genius of the poet could contrive. A curious wood cut of the Nativity has been preserved, with the following legend: "A religious man inventing the conceits of both birds and beasts drawn in the picture of our Saviour's birth, thus expresses them: 'The cock croweth, *Christus natus est*. The raven asketh *Quando?* The cow replieth, *Hac nocte*. The ox cryeth out, *Ubi, ubi?* The sheep bleateth, *Bethlehem*. Then the voices from the angels sounded, *Gloria in excelsis*.'"—

## Flowers.

It is said that almost all kinds of flowers sleep during the night. The marigold goes to bed with the sun and rises weeping. Many plants are so sensitive that their leaves close during the passage of a cloud. The dandelion opens at five or six in the morning and closes at nine in the evening. The daisy opens its day's eye to meet the early beams of the morning sun. The crocus, tulip, and many others, close their blossoms at different hours towards evening. The ivy-leaved lettuce opens at eight in the morning, and closes forever at four in the afternoon. The night-flowering cereus turns night into day; it begins to expand its magnificent, sweet-scented blossoms in the twilight; it is in full bloom at midnight, and closes never to open again at the dawn of day. In a clover-field not a leaf opens till after sunrise. So says a celebrated author, who has devoted much time to the study of plants, and often watched them in their slumbers. Those plants which seem to be awake all night he styles the bats and owls of the vegetable kingdom.

## Signs and Omens.

We heard a story the other day which pleased us "much," and here it is:

"Vell, don't dinks mooch of dem dings, und I don't pelieve averydings; but I dells you sometimes dere is some dings in sooch dings as dose dings."

"Now de oder night I sits and reads mine newspaper, and mine frau she speak and say:

"'Fritz,' de dog ish howlin'."

"Vell, I don't dinks mooch of dem dings, und I goes on and reads mine paper, und mine frau she says:

"'Fritz, dere is somedings pad is happen—de dog ish howlin'."

"And den I gets oop mit mineself, and looks out troo de vines on de porch, und de moon vas shinin', and mine leedle dog he shoomp right up and down like averydings, and he park at the moon dat vas shinin' so pright as never vas. Und as I hauled my het in de winter de old woman she says:

"'Mind, Fritz, I tell you dere somedings pat ish happen. De dog ish howlin'."

"Vell, I goes to pet und I shleeps, und all night long ven I wakes up dere vas dat dog howlin' outside, and ven I dream, I hear dat howlin' vorzer ash nefer. Und in de mornin' I kit oop und kits my preckfast, and mine frau she look at me and say ferry solemn:

"'Fritz, there is somedings pad ish happen. De dog vas howlin' all night."

"Und shoost den de newspaper comes in, und I opens him—und by shings! vat you dinks! dere was a man died in Philadelphia!"

**CURIOUS RIDDLE.**—It is said the following riddle, circulated by an emissary of the Austrian Government, was the *real* cause of Count Bismark's illness. The riddle is this:—In Prussia proper (that is, in *old* Prussia, and not in any of the new provinces *sewed* on to the kingdom by the *needle-gun*) there lived a blind beggar; that blind beggar had a brother; that brother died; *the man who died had no brother*; what relation, then, was the blind beggar to the man that died? This was too much for Bismark; nor were his feelings alleviated when it was suggested that the "blind beggar" might have been the *sister* "of the man who died," which was, in fact, the simple truth of the matter.

It is one of the worst of errors, to suppose that there is any other path of safety than that of duty.

INTELLECT is not the moral power; conscience and honor, not talent, make the man.

WHEN James T. Brady, the celebrated lawyer of New York, first opened a lawyer's office, he took a basement room which had been previously occupied by a cobbler. He was somewhat annoyed by the previous occupant's callers, and irritated by the fact that he had few of his own. One day an Irishman entered.

"The cobbler's gone, I see," he said.

"I should think he had," tartly responded Brady.

"And what do you sell?" he inquired, looking at the solitary table and a few law books.

"Blockheads," responded Brady.

"Be gorra," said the Irishman, "ye must be doing a mighty fine business—ye hain't got but one left."

## Don't believe in Telegraphs.

There was a man who lived in Cass County, Georgia, many years ago, who had once been in the State Legislature, and never neglected an opportunity to emphasize the fact. He was a perfect infidel as to new discoveries and new sciences, being perfectly satisfied that if the world should turn over all the water would spill out of his well; and only giving in to steam cars

by slow degrees. But all the vials of his contempt were poured out upon the idea of a telegraph, and he was wont to say that nobody need try to come "the green" over him in that way, for he had been in the Legislature. Finally, the State road was built, and one day workmen began to put up telegraph posts right in front of his house, and to stretch the wire. His exultant neighbors thought they had him on the occasion, and asked:

"Well, old fellow! what do you think of telegraphs now?"

He was cornered, but died game. Drawing himself up an inch taller, he said:

"Gentlemen, when I was in the Legislature I gave this subject my very attentive consideration. And I said then, as I say now, that it may do for letters and small bundles, but it will never take a cotton bale—never!"

## Taste Not.

Drunk! Young man did you ever stop to think how terrible that word sounds? Did you ever think what misery you brought upon your friends, when you degraded your manhood by getting drunk? Drunk! How it rings in the ear of a loving wife! How it makes the heart of a mother bleed! How it crushes out the hopes of a father, and brings reproach and shame upon sisters. Drunk! See him as he leans against some friendly house. He stands ready to fall in the jaws of hell, unconscious as to his approaching fate. The wife, with aching heart, sits at the window to hear her husband's footsteps, but they come not! He is drunk! Drunk! He is spending the means of support for liquor, while his family is starving for bread, his children for clothing. Drunk! His reputation is going, gone! His friends, one by one, are leaving him to his fate. He goes down to his grave "unhonored and unsung." Drunk!—*Ex.*

## No Person is Without Influence.

Some persons fall discouraged on the highway of life, because they cannot be this or that great or eminent person. Why not be willing to be *themselves*? No person, who ever has or ever will live, is without influence. Why not make the most of that? Since you cannot grasp that which you wish, why let what you have slip through your fingers? No person in the world is exactly like you. You have your own faults, but you have also your own excellencies. Give them air. Because you are not a poet, should you not be a good merchant? Because you cannot go to college, should you therefore forswear the alphabet? Because you cannot build a palace, should you not rejoice in your own humble roof, and that because it is your own? Will not the sun shine into your windows if you do not obstinately persist in shutting it out? If you cannot have a whole hot-house full of flowers, may you not have one sweet rose?

## A Pittsburgh Conundrum.

Why should the employees of the Pittsburgh Western Union Telegraph Office emigrate to the far West?

Because it would require but a little *More-land* at a *Low* price to provide comfortable *Holmes* for all hands. In the way of provisions, beside the certainty of finding a *Buck-out* there, they could subsist on *Fish-or*, *Fruit* or better still that great staple of the West, *Maize*. As to fuel, they have a *Full-wood* supply while the *coal-stock* on hand would always be two *Full-tons*, with *Coal-tar*, beside. They could *Stough* their traps away, and with one *Kir-by* the wagon and another *Kerr* loose they could do the journey up *Brown*. The most shallow observer (if this were *Dun-*) can see that it would produce una-*Lloyd* happiness. So all *Will-I-am-sure* join in the sentiment, "Let us be *Hauff* for the West and hoe our own *Rouse*."

JENNIE.

THE Emperor of Russia contemplates building a railroad from China across Asia to the capital of Russia, his purpose being to prevent the United States, with its railroads and steamers, from monopolizing the whole China trade. Agents of the Russian Emperor are now in the United States engaged in studying our railway system.

CHESTER, PATRICK & CO.,

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

38 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

CHARLES WILLIAMS, JR.,

109 Court Street,

BOSTON, MASS.,

MANUFACTURER OF

TELEGRAPH INSTRUMENTS,

BATTERIES,

AND MATERIALS OF ALL KINDS.

WM. KIDD,  
A. BOODY.

C. H. PRIBOR,  
C. S. OTIS.

KIDD, PEIRCE & Co.,

BANKERS,

19 BROAD STREET AND 57 EXCHANGE PLACE,

NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission

S. S. STAFFORD'S COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 83¼ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

A. S. OHUBBUCK,

HOTEL STREET,

(Adjoining the Post Office,)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

CHAS. T. & J. N. CHESTER,

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS,

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

SHAWK & BARTON,

Manufacturers of

ELECTRICAL INSTRUMENTS,

And Dealers in

TELEGRAPH SUPPLIES,

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zinca,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.,	&c.	&c.

We continue to manufacture Instruments after the favorite

WESTERN UNION STANDARD PATTERNS,

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

COMPLETE OUTFIT OF ELECTRICAL APPARATUS,

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

NO. 38 ST. CLAIR STREET, CLEVELAND, O.

G. W. SHAWK,

E. M. BARTON.

OFFICE OF THE

BISHOP GUTTA PERCHA COMPANY,

113 LIBERTY STREET,

SAMUEL C. BISHOP, General Agent.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1893.

General Agent.

STICKWELL & CO'S  
EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 80Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

 Having adopted the use of  
**OREIDE METAL;**  
 which is much richer and finer than brass, he now presents his  
 work in a style and of a quality that are unsurpassed.  
 His Relays were awarded

**THE FIRST PREMIUM**  
 at the late Great Fair of the American Institute, N. Y., and their  
 superiority is generally acknowledged by operators who use them.  
 Aside from the advantages apparent upon inspection of these  
 magnets, their acknowledged merits consist in the construction of  
 the helix, which was patented August 15, 1865. This being of naked  
 copper wire, so wound that the convolutions are separated from  
 each other by a regular and uniform space of the 1-800th of  
 an inch, the layers separated by thin paper. In helices of  
 silk insulated wire the space occupied by the silk is the 1-150th to  
 the 1-300th of an inch; therefore a spool made of a given length and  
 size of naked wire will be smaller and will contain many more con-  
 volutions around the core than one of silk insulated wire, and will  
 be a proportionally stronger magnet, while the resistance will  
 be the same.  
**PRICES.**  
 Relays with helices in bone rubber cylinders, very  
 fine..... \$19 50  
 Small Box Relays..... 16 00  
 Same in Rosewood..... 17 00  
 Medium Box Relays..... 17 00  
 Same in Rosewood..... 18 00  
 Large Box Relays..... 18 00  
 Main Sounders, same as the above, with heavy arma-  
 ture lever, without local connections..... 75 cents less  
 Pocket Relays, with all the adjustments of the above  
 and good Lever Keys..... 22 00  
 Excellent Registers..... 40 00  
 Pony Sounders..... 6 75  
 Keys..... 6 50  
 All other appliances made to order. Extra spools for replacing  
 such as may be spoiled by lightning, furnished at \$1.25 each. Old  
 spools taken at the price of new wire by the pound. Goods sent to  
 all parts of the continent with bill C. O. D. Or, to save expense of  
 returning funds by express, remittance may be made in advance by  
 certified check payable in New York, or Post-office orders, in which  
 case he will make no charge for package.

NO. 6.

NEW YORK, FEBRUARY 15, 1869.

VOL. II.

## GEN. ANSON STAGER.

Anson Stager, General Superintendent of the Central Division of the Western Union Telegraph Company's lines, was born in Ontario County, N. Y., April 20th, 1825. Like a large majority of those who entered early into the telegraph service, Mr. Stager was "of the fourth estate," having at sixteen years of age engaged in printing under the instruction of Henry O'Reilly—himself, afterward, a pioneer in the building and operating of telegraphs.

In October, 1846, Mr. Stager commenced work as an operator in Philadelphia. He shortly after removed to Lancaster, Pa., and upon the extension of the line across the Alleghenies was the first operator who worked in Pittsburgh. In the Spring of 1848 he was made chief operator of the "National lines" at Cincinnati, in which position he served so acceptably that in 1852 he received the appointment of Superintendent of the lines of the Mississippi Valley Printing Telegraph Company. In July of the same year, through the absorption of the New York State Printing Telegraph Company's lines by the Mississippi Valley Printing Telegraph Company, his supervision was extended over that State.

Mr. Stager was prominent in organizing the various lines and interests leased by and consolidated with the Western Union Telegraph Company, and upon the organization of that Company he assumed, and has since occupied, the position of its General Superintendent. The extensive and elaborate system of railroad telegraphs at present in use on all the railroads in the West and Northwest is his work. The intimate connection existing between the telegraph and the railroads of the country, combining two great and distinct interests—that of the telegraph company in the revenue-earning business of the railroad lines, and that of the railroad companies in the transmission of their own messages, the moving of trains, comparison and adjustment of accounts between stations, and all the detail of correspondence that attaches to railroad ing, is one affording ample opportunity or clashing and confusion. By the admirable simplicity, complete adaptability and perfection of detail of Mr. Stager's system of contracts and plan of operating railroad lines, these interests work together in entire harmony. Telegraphic facilities are always at the disposal of the railroads in emergency, and have again and again given most vital aid, while a reciprocal promptness to assist the telegraph is invariably shown by the railroads when occasion arises.

The days of the growth of the Western Union Telegraph Company, from its little nucleus of a single wire from Buffalo to Louisville, Ky., to its full and perfect stature, were anything but days of idleness to its officers, and Mr. Stager was a busy man all these years. Riding by stage-coach, steamboat and rail (and there were no sleeping cars in those times) by night, consulting, directing, making contracts and executing the

work they called for, by day, he occupied the time until 1860—to what practical effect the growth and success of the Western Union Telegraph Company in the territory over which his supervision extended best testify. When Sumter was fired on, the Governors of Ohio, Illinois and Indiana took possession of the telegraph lines in those States for military purposes, putting them at once in charge of Mr. Stager as representing themselves in their official capacities. This trust was not transferred during the war. Mr. Stager accompanied Gen. McClellan in his West Virginia campaign, during which he established the first system of field telegraphs used during the rebellion. When Gen. McClellan was transferred to Washington, Mr.

GEN. ANSON STAGER.

Stager was called by him to that Department to organize the military telegraph. This he accomplished, remaining in charge thereof until November, 1861, at which time he was commissioned Captain and Assistant Quartermaster, and by order of the Secretary of War, appointed Chief of United States Military Telegraphs throughout the United States. He was subsequently commissioned Colonel and Aid-de-camp, and assigned to duty in the War Department, and was also placed in charge of the cypher correspondence of the Secretary of War. The cryptograph used in this correspondence through the entire war, which baffled the most persistent efforts of the rebel telegraphers and officers to translate it, was, in all its detail, his, though he lays no claim to its germ.

Col. Stager remained in the service until September, 1865, and was breveted Brigadier-General for valuable and meritorious services. Following the close of the war, the consolidation of the Southwestern and American Telegraph Companies with the Western Union Telegraph Company, necessitated a re-organization of the latter. At this time the General Superintendency of the consolidated company was offered to and urged upon Gen. Stager. For reasons of his own, preferring to remain in the West, he declined the appointment. A result of this was the creation of the present three "Grand Divisions," the Central, Eastern and Southern, Gen. Stager accepting the General Superintendency of the Central, which left him in charge of the same territory as before the re-organization, with his headquarters at Cleveland. At present he is completing his arrangements for removing them to Chicago, where he will in future be found.

Of clear, quick and accurate judgment, full of vital force and energy, self-reliant and persistent, Gen. Stager stands in the front rank of his profession, a man of distinguished administrative and executive ability. Not less quick in action than in conception and decision, his errors are more liable to be those of commission than omission, though few of either sort stand against him. In controversy, he greatly prefers the initiative, having an abiding faith in the proverbial "first blow" as the best half of the battle. Attaching himself to a friend, he adheres impervious to outside influences, and whoso having gained his confidence, loses it, may be assured that the reason is somewhere between themselves. His genial disposition and high spirits surround him with friends and give him a popularity both in his business relations and in the social circle. His age is forty-four years, though he looks younger. He has a moderate competency, the result of savings and some fortunate investments and ventures, and with ordinary good fortune, may look forward to an easy future and a comfortable old age.

M.

## A "Key-Warmer."

Some ingenious person has patented a "key-warmer" for pianos and organs, the design of which invention is to keep the keys of the instrument from chilling the fingers of the player. I can tell him of a piano and organ key-warmer which is very simple and effective, though I am not aware that it has ever been patented. It consists in a *roasted potato*. For some winters past I have known it to be used by many ladies in divers places. The roasted potato, wrapped in a bit of flannel, is taken to church in a small bag, whence it can be brought out when needed to be held in the hands of the fair lady who acts as the unpaid organist or harmonium player. Fingering the icy keys of an organ in a cold church on a winter's day is certainly a chilling performance; and there are some who read this who may thank me for the hint of the

roasted potato. It will retain the heat during the service. One trial will prove the fact, as the advertising grocers say—*Once a Week*:

### OPINIONS OF THE PRESS.

#### The Government and the Telegraph.

[From the New York Times.]

A very strenuous effort has been made by those who urge the government to enter into the business of telegraphing to convince the public that the service would be much more economical than it is at present, and that telegraphing could thus be made much cheaper and more accessible to the great mass of the people.

The expenses of our Post Office Department (which Mr. Washburne proposes shall do the telegraphing for the people of the United States), exceeds its income by over six millions of dollars. That concern cannot guess within one hundred millions the number of letters it transmits per annum. It helplessly sends over 4,500,000 letters to the Dead Letter Office every year. It has no more than forty-six free-delivery offices, in a total of 29,387 post-offices in the United States. It is a political machine from top to bottom, liable to change and reconstruction after every presidential election, and subject to partisan service previous to and during every election. But let us look for a moment to the interest which the publishers and readers of daily newspapers have in the change proposed. In the year 1867 the Western Union Telegraph Company delivered to the Press of the country 294,503,630 words of news, at a cost of three and a half cents for a message of twenty words, or one and seven-tenths of a mill per word. This service was principally performed at very late hours of the night. That it was well done, that it was zealously done, every manager of important morning papers in the country can truthfully testify. The superintendents and operators of the main receiving and distributing offices of the company were in sympathy and accord with the press. The interests of both were identical and reciprocal. Patience and courtesy marked the intercourse of the company's agents with the representatives of the newspapers. Nothing on this score was left to be desired. In a word, the service of the press by the Western Union Telegraph Company, its painstaking, its industry, its liberality, its disposition to oblige, were perfect. A change of this service from the company, or another organization like it, to the government, must be a change for the worse. There can be no doubt about this. The clerks of the telegraphic branch of the Post Office Department would surely partake of the spirit that characterizes nearly all American governmental employees. They would be indifferent, unsympathetic, generally supercilious, disposed to shirk work, and would do no more and no better than was necessary to retain themselves in place. Beyond that they would subside into mere office-holding. Their responsibility would be to their departmental chiefs. It would not be possible for these to be animated by a constant desire to earn profits, for they would not have a shareholder's interest in earning profits. Therefore, all that impelling motive to satisfy the public, which is essential to the growth and profitableness of a business, would be wanting to the bureaucratic managers of the government telegraph, and would be found wanting in their subordinates. The service of the press would inevitably fall off in zeal and vigor, less news would be published, and the interest which the great papers now have for their readers would be

impaired. The consideration of economy connected with the proposed assumption by government of the telegraph business possesses more interest even for the newspaper press than the quality of service the change would bring. The 14,725,181 words furnished to the press of the United States by the Western Union Telegraph Co. in one year cost only \$521,509. It is a striking and very suggestive fact that this quantity of news is greater than the entire telegraphic correspondence of all Continental Europe, from which the paternal government therein charge and receive \$11,597,632 a year. The following table will show a warning contrast in this respect between the European system of control by the State and the American system of private management. The number of messages delivered to the press is obtained for this comparison by dividing the total number of words furnished to the press by twenty, the standard in Europe:

STATEMENT SHOWING THE AVERAGE COST OF TELEGRAMS IN CONTINENTAL EUROPE AND THE AVERAGE COST OF PRESS TELEGRAMS IN THE UNITED STATES, WITH TOTAL AMOUNT OF EACH PER ANNUM:

Total number of messages transmitted in Continental Europe for the year 1866.....	12,905,538	Total number of messages furnished to the newspapers of the United States for 1866.....	14,725,181
Gross receipts for the above.....	\$11,597,632.71	Gross receipts for the above.....	\$521,509
Average cost of telegrams in Continental Europe.....	81 cents.	Average cost of press telegrams in the United States.....	3½ cents.

This exhibit shows the economical results of leaving

There is nothing like it in Europe, and there never will be anything like it there until Europe is democratized. Consider the immense machinery which the Western Union Telegraph Company already has in harmonious and precise motion all over the United States. It possesses 3,331 telegraph offices, 50,760 miles of line, 97,416 miles of wire, 265 submarine cables, 6,389 skilled employees. The publishers of newspapers should, in the interest of their readers, cling to their present telegraphic news system tenaciously, and should regard with jealousy and oppose with vigor every movement of the government in the direction either of a control of the general business of telegraphing, or an incorporation of it into any department of its civil or military administration. It is impossible for the government to perform a service or to manufacture a product as cheaply as individuals or corporations can. If it should, by its interference, break down the existing admirable system of obtaining telegraphic news at low rates, it would be compelled to raise the rates, or to present to Congress and the people the annual deficit of income as compared with expenditure which now characterizes the service of the Post Office Department. Fluctuations of rates, and, in the end, permanently higher rates, would inevitably be the consequence. Mr. Washburne's bill to annex the telegraph to the post office provides for a general tariff of one cent per word for telegram,

with an additional charge of three cents for postage and two cents for delivery, and stipulates that a reduction upon press reports shall be made of not more than fifty per cent. This rate would increase the average cost of news to the press of the United States more than three hundred per cent., and would compel the newspapers to pay an extra tax of a million dollars a year for the privilege they now enjoy. As a matter of course, whatever increases the cost of newspapers to those who make them, increases their cost in a corresponding ratio to those who read them. The operation of the proposed change, therefore, upon the press, and through it, upon the great mass of the reading public, would be exceedingly injurious, and we feel warranted in calling upon the press of the country to expose and resist it.

### In Congress.

#### AMERICAN AND ASIATIC TELEGRAPH COMPANY.

Mr. Morgan, of N. Y., from the Committee on Commerce, reported back a bill to encourage and facilitate telegraphic communication between the Eastern and Western Continents with an amendment in the nature of a substitute.

It provides that the American and Asiatic Telegraph Company shall have the exclusive right for fourteen years to construct and maintain a line or lines of submarine cable to connect the two continents, provided such line or lines shall commence at Cape San Juan, Washington Territory, and be laid by way of Alaska, and provided work be begun within one year from and completed within three years from the passage of this bill.

Section two authorizes the Secretary of the Navy to detail one or more steam vessels to assist in making soundings, transporting material and laying cable.

Section three provides for giving the United States priority in the use of the lines and the right to connect military posts with them; also authorizes the Secretaries of War and Navy to protect them when necessary.

The last section reserves to Congress the right at any time to add to, alter or repeal the foregoing provisions.

the Press and the Telegraph perfectly free. It shows the repressive and wasteful effects of governmental interference with the business of the people. The collection and transmission of news by telegraph is one of the greatest benefits Americans enjoy. Negatively they owe it to the fact that the government has hitherto wholly let the telegraph alone, and has minded its business of political administration. Positively, they are indebted for it to the combined enterprise and public spirit of the press and the Western Union Telegraph Company, the latter transmitting the reports gathered by the former at a price which barely covers the cost of the labor employed, and which leaves nothing to repair wear and tear of lines or to pay interest on the investment to construct them. This system is the best in the world for the press and the public.

### The Postal Telegraph Scheme.

[Reported for the JOURNAL OF THE TELEGRAPH.]

Remarks of Hon. William Orton, President of the Western Union Telegraph Company, before the Congressional Committee on Post Offices and Post Roads, at the final audience given to parties interested in the Postal Telegraph schemes presented by Mr. Hubbard and others, Washington, February 2, 1869.

Mr. Orton having been notified by the Chairman that five minutes were allowed him in which to address the Committee, spoke as follows :

MR. CHAIRMAN—I am exceedingly sorry that I am allowed but five minutes in which to close this case. I think it was in the month of October last that I received a copy of a communication over the signature of Mr. Hubbard, in print, although not published, addressed to the Postmaster General upon the subject which Mr. Hubbard has been presenting to this Committee. We had been engaged some months previously in collecting data from authentic sources, and in the preparation of a reply to a paper submitted by the Hon. Mr. Washburne of Illinois, toward the close of the last session of Congress. We included in our statement a discussion of the points raised by Mr. Hubbard. When I came to attend the sessions of this Committee and the discussions upon this subject, I had the proofs only of our paper in my possession, which I turned over to the Chairman of the Committee. On the first day of the argument I received a copy of the communication from the Postmaster General addressed to Congress, containing a copy of a communication from Mr. Hubbard to the Postmaster General, which I found, on examination, was a materially different document from the one which I had been reviewing. Of course I was unable to take up the statistical portions of that statement from simply a cursory glance at it, and point out the errors of fact and the fallacies of deduction, and I waited until my return home to make that investigation. I have here before me what I had hoped to have the opportunity to present to the Committee—a dissection and review of the new document in detail, including the Report of the Postmaster General. Being unable, for lack of time, to present it to the Committee in its present form, I shall be under the necessity of printing it for circulation.

I now assert that every material statement alleged to be based upon the telegraph systems of Europe, and which has been presented here as the foundation for the claim of this scheme, is either erroneous in its direct statement, or erroneous in its arrangement, and still more erroneous in the deductions therefrom. I hold in my hand a portion of what I had prepared, from which I will read a further extract from the report of the Belgian government, concerning its own telegraphs :

"Previous to 1815, the unexceptionally favorable financial situation of the Belgian telegraphs was due to the international tariff. It is because this resource has ceased to increase in sufficient proportions to compensate for the increased expenses of the interior telegraph, that the Belgian government has made so radical a change, and has sought to obtain from an exceptionally low tariff an increased traffic. The financial situation before mentioned permitted it to risk this experiment, but, as it proves, it has not met with the wished-for success."

And these are the facts : that in 1866 the gross expenses of the Belgian telegraph service were 1,317,496 francs, and its receipts for business done within its own territory 408,634 francs, leaving a deficiency of over 800,000 francs. In 1867, the gross receipts of the Belgian service were 1,128,703 francs, and the gross receipts from inland messages (i. e., within its own territory), 480,000 francs, leaving a deficiency of about 650,000 francs. So that in two years the deficiency, so far as its own territorial business was concerned, was 1,456,000 francs, and although it received a large sum for the right of shooting messages through its air, to and from neighboring nationalities, there was still a defi-

ciency in the two years of over 300,000 francs, which had to be raised from the people by taxation. And that is the telegraph system the facts concerning which are distorted and presented here, and sought to be made the basis of a scheme for the organization of a new speculation, which, its projector admits, cannot succeed without Congressional aid.

Now, sir, a word or two more concerning Mr. Hubbard's statistics. In the October pamphlet he stated the number of letters transmitted by the mail in the United States, I think, at four hundred and fifty millions. In the recent paper it is stated at over seven hundred millions. I have before me the statistics of the postage stamps and stamped envelopes issued for the years 1866 and 1867. I take it there can be no more letters sent through the mail, during a given period, than there are stamps issued, assuming that each stamp represents a letter, which we know is not the fact. The total number of stamped envelopes and postage stamps issued by the Post Office Department for the year ending June 30, 1866, was 293,294,000 ; for the year 1867, 343,158,000, making an average for the two years of 318,000,000. The error, however, is not material, except as it shows the unreliability of his statistics. There are 46 cities of the United States in which letters are delivered free ; and yet here are San Francisco with a population of 56,000, Charleston with 50,000, Richmond between 30,000 and 40,000, Mobile, Dayton (Ohio), Springfield (Mass.) and a large number of others, where there is no free delivery at all.

The proposition, Mr. Chairman, to add anything more to a Department which, in the last fifteen years, has run the Government in debt over forty-six millions of dollars, of which about one-fourth has accrued during its present administration—I say such a proposition is absolutely preposterous.

I suggested rather than presented as a point, on the last occasion when I had the honor of addressing the Committee, the possibility of your not having the right to confer upon this proposed company the privileges which they ask in respect to rights of way on railroads in the States. I now make this further point after having carefully considered the subject and examined the authorities relating thereto, that you have no right to incorporate a company to embark in a private business within the States. There are precedents for the incorporation of a company to carry on a function of the Government authorized to be carried on by the Constitution ; but none which concede to Congress the right to incorporate a company to carry on a purely private business within the States. Whether the Government has any right of eminent domain within the States is an abstract question. The fact is that it claims no such right and does not exercise it. In the year 1865 the Attorney General came to the Legislature of the State of New York, the Government desiring to purchase 150 acres of land whereon to erect a fort. The owners of the property had refused to sell. The Government came to our Legislature not only asking permission to purchase, but asking the State to put the Government upon the same footing that they put railroad companies in the State, and to make provision for condemning the right of way under officers appointed by the State. And such I have ascertained to be the uniform action of the Government in such cases in the States. This bill proposes no plan of condemnation, no mode of ascertaining the value of the private rights proposed to be taken, but assumes to give directly the right to invade every State, to hold real estate therein against the explicit provision of State law, to take private property with no other provision for compensation therefor than that in the event that its owner can prove that he has been damaged, a mode is pointed out for determining the damage. I submit that there is no exigency which requires the

exercise of so doubtful powers, powers which I do not believe can be rightfully exercised at all. In conclusion permit me to add :

The United States Post Office Department charges three cents postage for a letter delivering free at only forty-six offices out of a total of more than twenty-nine thousand, employing but eight hundred and thirty-seven carriers, and makes a total loss of nearly six and a half millions per annum. The Western Union Telegraph Company transmits telegrams at an average of one-half the Government rates in Europe, provides nearly a hundred times as many free delivery stations as the Post Office Department, transmits press dispatches for less than it costs the Government to send its letters through the mails, and yet manages to realize fair profits, out of which it is rapidly extending its wires to points where mail service is unfrequent and irregular, is increasing facilities to meet the growing demand for telegraphic intercourse between the great centres of trade and commerce, and at the same time is steadily reducing its tariffs without regard to the operations of competing lines. We submit, very respectfully, that there is no occasion for governmental interference with the enterprises of its citizens which produce such results, and especially none for saddling upon a Department which is already losing annually a sum nearly equal to the whole telegraphic receipts of the country, an inexperienced company of speculative contractors who confess their inability to enter the open field of legitimate competition by the fact of their application to Congress for aid.

### New Telegraph Stock for Wall Street.

The last annual Report of the Postmaster General included and adopted a communication from Gardiner G. Hubbard, on the subject of a postal telegraph, in which he gives the history of the telegraph in the United States. He says, among other things : "Between eighty and ninety companies were in operation in 1850. These lines were constructed by parties interested in the different patents of Morse, House and Bain ; competition between them was the rule. They were built without any comprehensive plan or knowledge of the wants of the community, wherever subscriptions for stock could be secured or stock sold by enterprising contractors. The owners of the patents received from one-third to one-half of the stock issued, the contractor the remainder. The lines were poorly constructed, of poor materials, poorly operated and maintained, and were generally worth no more than the stock paid for building them. Every new enterprise has been projected and carried out by a set of unprincipled sharpers, whose prime object has been to fill their own pockets at the expense of credulous stockholders."

The last "new enterprise" of note, whose ruin Mr. Hubbard mentions, was the United States Telegraph Company, whose expenses for 1865 were \$771,763, and whose earnings were \$668,422. Its losses that year of \$103,341 broke it. The line was sold.

Our readers can now understand why it is utterly impossible to place new telegraph stock on the market. But Mr. Gardiner G. Hubbard has hit upon a scheme which he thinks will sell half a million of such stuff, and, perhaps, many millions. He has persuaded the Postmaster General to submit to Congress a "bill to incorporate the United States Postal Telegraph Company, and to establish a postal telegraph system," which is to make Hubbard and his associates a body politic and corporate, with perpetual succession, having power to build and operate lines over all post roads and routes within the United States. There's a charter ! That is what the wise Mr. Wemyss calls "portable property." The bill authorizes the Post-

master General to establish a postal telegraph system, with certain provisions. The last of these provisions (the cat is to be looked for at the bottom of the meal-tub) enacts, with words of inexorableness, that if the Postmaster General shall, within six months after Hubbard gets himself and his friends chartered, offer to make a contract with them for the transmission of messages at prices named, "they shall, on their part, make such contract." Our sympathy for these victims of arbitrary power culminates in a horrid doubt if we live under a free government, when we read further on in the section: "That at the expiration of such contract the Postmaster General shall have the right to require the corporation hereby chartered to renew the said contract for another term of ten years." The section imposes the dreadful penalty on Hubbard and friends as a body corporate of being knocked into two disfranchised cocked hats successively, first for refusing to contract with the Postmaster General; second, for refusing to renew the contract for ten years! When our readers get through laughing, they will begin to feel that Hubbard has a genius for selling telegraph stock. But they don't know Hubbard.

Sec. 5 of the bill establishes his postal telegraph system. The first provision of it frees Hubbard from all telegraphic service save the very cream of the business. His postal telegraph is to be set up only at railroad stations and in cities and villages containing 5,000 inhabitants and upward! Surely Hubbard's telegraph stock will sell.

The second provision brings Hubbard and his telegraph to all men's hearts and doors by requiring messages to be received, among other places, at every street letter box. That's accommodation! and it is simple malice to say that a commercial or financial order, or a message of sickness or death, of appointment or response, would never be thrown into a lamp-post box to wait the tardy coming of a carrier. And none but a base emissary of the Western Union monopoly would malignantly hint the immaterial query: how many cities are there in the United States which possess street letter boxes?

The 4th provision insures "special and immediate free delivery" of messages by carriers within the limits of free delivery of letters from post offices, &c., &c. There are 29,387 post offices in the United States. How few people know that there are forty-six free delivery offices! Hubbard, you are charming!

It is in the sixth provision, that with three words, "priority of transmission," Hubbard's genius to sell a new telegraph stock flashes for an instant with the power of a calcium light. The Western Union monopoly is vulgar. It has always refused special privileges. It is governed by a couple of mean maxims—"equal rights to all," and "first come, first served." This reduction of the rich and poor, the powerful and the weak, the crafty and the simple, to a common level before its wires is low and disgusting. Hubbard's telegraph is the thing for gentlemen. It will give wealth its proper power. It will allow to combinations the advantages which are justly due to strength, and will speed cunning and smartness on their lawful way to sweep up a market or "scoop" a street. Hubbard, your stock is sold!

The sixth section, second provision, is designed to divide the telegraph business between the old companies and Hubbard's new one, on the principle upon which the platter was licked clean between Jack Spratt who ate no fat and his wife who ate no lean—Hubbard is to have the fat. He is "required" to extend his lines "to cities and villages that may hereafter acquire a population of 5,000 inhabitants and over. Such lines shall be provided between Washington, New York, Boston and Chicago, within twelve months from the execution of the contract; to Cincinnati, St. Louis and New Orleans within two years; to

every city and village of 5,000 inhabitants and over, situated east of the sixteenth degree of longitude, west from Washington, within three years, and to every other such city and village within five years from the execution of said contract." East of the sixteenth degree is in effect east of the Mississippi river, and is the seat of American population, industry and wealth. The lean of the telegraph business, west of the Mississippi, and among the buffaloes and Indians, and through the Rocky Mountains, and in all towns and villages having less than 5,000 people, is to be left to the Western Union and other organizations. Hubbard, we burn to know you.

But it is a clause in the ninth section of the bill which expands our confidence in Hubbard as an engineer of new telegraph stock into enthusiastic faith. We quote: "All messages, except those marked 'priority,' on which extra rates have been prepaid, shall be transmitted in the order in which they are received." Let this postal telegraph bill become a law, and Hubbard's lines be built or bought, what immense speculations would take place in breadstuffs, in government securities, railroad stocks, in gold, in cotton, in sugar, in everything that can be engrossed, or the price of which can be put up or put down by the transmission of news, or the exclusion of news! Cliques in New York, Chicago and elsewhere, would devastate the markets. The corporate property and municipal debt of the whole country would pass into the hands of a few men. Hubbard telegraph stock sell! Why, the fury to get it in Wall street would be so great that the Commissioners to open the subscription books would be torn in pieces in the struggle to obtain priority. All that Mr. Hubbard has to do to sell ten millions of his stock is to pass his United States Postal Telegraph Company bill, and get Johnson to sign it.

Press your scheme, Mr. Hubbard. Don't let it go over to the next Congress. Try to pass it at this session. Just fetch it once under the fire of the yeas and nays of the House of Representatives, so that we can see how much higher than a kite this job so swollen with patriotic false pretenses, so contrived for monopoly so careless of the people's interests, so designed for robber-like speculations, can be knocked.—*N. Y. Tribune.*

#### The Coming Despotism.

The progress toward despotism would be exceedingly rapid, if all the schemes now proposed in Congress should be adopted. We have plans to build levees and railroads and canals, to tunnel mountains and mine ores and bridge rivers, at government expense, and, not content with setting up new establishments, the reformers are proposing to seize all the telegraph and railroad lines and operate them under the control of the government officials. Of course, this would be a wonderful improvement! Everybody knows that the government manages everything so economically and honestly! The postal department, for example, and the collection of taxes—what private corporation would be tolerated whose business was so badly conducted? But because Uncle Sam has been unfaithful in little things, it is proposed to entrust to him far greater responsibilities.

The railroad scheme will hardly pass at this session, we suppose. But there is danger that the telegraph bill may be pushed through, mainly because it is rumored that a ring of great strength has been organized to make money by means of the transfer. With parties interested, there also are associated others who seem really to imagine that the people will gain in some mysterious way by the transfer. Among these, strange to say, is Mr. Washburne, whose guardianship of the treasury seems to be strangely relaxed in this instance. We do not see how any man can doubt that

the management of telegraph lines by government would soon result not in profit but in enormous loss to the Treasury. Another host of office-seekers to be appointed, and when appointed to clamor for a twenty-five per cent. increase of salary; another batch of offices and public buildings to be established and repaired at the public expense, and consequently in the most costly manner; another big hole for leakage and stealage—really Mr. Washburne must have extraordinary confidence in the success of his efforts if he thinks he can protect the Treasury against all these new inroads!

Our experience as a nation has surely been thrown away if it has not taught us that anything can be done by private enterprise more promptly, thoroughly, cheaply and reliably than by government agents. Whether it be building of ships or guns, transmission of supplies during the war, or of packages and letters in peace, private enterprise has in every field proved its ability to eclipse the doings of hired officials. There are a dozen private companies to-day which would undertake to manage the whole postal department of government more satisfactorily, and at far less cost than it is managed now. Instead of putting new burdens upon shoulders so manifestly unable to bear them well, it would be better to let out as much of the government business as possible to private companies. But above all, we trust that the Treasury will not have another hole bored into it by the success of the telegraph scheme. We are having money enough stolen already by rings and combinations, without adding a new avenue for leakage and stealage.—*Missouri Democrat.*

#### The First Steamer on Great Salt Lake.

*Editors of the American Artizan:*

I had the pleasure about four weeks ago of starting the engine of the Kate Connor, the first steamboat ever run on Great Salt Lake. She is fifty feet long by ten feet beam, has side wheels, and is owned by Gen. P. E. Connor, of Stockton, Cal., and was built by Mr. G. Hayward, of this city. The engine was arranged and her reversing gear attached by myself. She is now engaged in hauling ties for the Central Pacific Railroad. The locomotive was within forty miles of us on Saturday last, on the eastern line.

W. J. SILVER

SALT LAKE CITY, January 19, 1869.

HERE is a specimen of a decidedly new idea in the way of advertising. These theatrical telegrams are enclosed in envelopes marked "Immediate," and, of course, receive very prompt attention:

THE LYDIA THOMPSON BURLESQUE TELEGRAPH COMPANY.

This Company was incorporated and established in Europe for the purpose of producing a repertoire of the best modern Burlesques by the leading dramatists of the day in America, supported by the most complete and powerful Company, comprised of artistes holding the highest position in the profession.

ALEX. HENDERSON, Sole Manager.

RECEIVED AT BROADWAY,  
January 1869.

To Burlesque Patrons:

The Lydia Thompson Burlesque Troupe open at Niblo's Garden 1st February in "The 40 Thieves." It will be splendid. You can secure any seats you may wish, a month in advance.

JARRETT & PALMER, Niblo's Garden.

Next to Sincerity, remember still,  
Thou must resolve upon Integrity.  
God will have all thou hast; thy mind, thy will,  
Thy thoughts, thy words, thy works.

### Paraffined Battery Jars.

One of the necessary requisites, in order to obtain the full strength and economical use of a galvanic battery, is perfect insulation. If an ordinary glass jar is inserted in a larger vessel filled with mercury, and the jar filled with mercury so as to leave the upper surface projecting above, and one pole of a battery of a thousand cells is placed in the mercury outside, the other pole of the battery in the mercury within, and a delicate galvanometer in the circuit, a steady deflection (constant of galvanometer, say 500 degrees, with one cell through 100,000 ohms) of 5 to 50 degrees is obtained, varying according to the quality of the glass and dimensions of the jar; the common or ordinary glass giving greater resistance than the finer qualities, or such glass as contain metallic oxides in its composition. The actual conduction of glass is so small as to be of little or no consequence, practically; but if water is substituted for mercury the deflection is much greater, owing to the hygroscopic properties of glass; or, in other words, its affinity for moisture, which is infinitely increased when a liquid is used of the nature of a solution for battery purposes. If one of these jars is employed in the test, with water, there is no apparent deflection. If we use a trough sufficiently large to hold a hundred, and make branches of the one pole sufficient to enter each of these jars, with the other pole in the trough, there is less deflection than with one glass jar in the mercury test—the size of the jars being equal in both cases. An approximate idea is thus obtained of the conductivity of these jars as compared with glass. The ordinary stone jar, under the mercury test, when perfectly dry, shows greater resistance than glass, but with water it gives scarcely any resistance, being extremely porous. When used for battery purposes the liquid flows through the jar, forming a crystalline deposit upon the outer surface, which conducts in a short time sufficiently to divert the greater portion of the current from its proper channel or conductor, and for this cause the material of the battery is soon exhausted, even when not in use. The material of these jars is the same as used for earthenware insulators. As a non-conductor it stands infinitely higher than glass, and is not chemically affected by acids. These jars are manufactured at the Brooks Patent Paraffine Insulator Works, No. 21 Aspen street, Philadelphia, and are tested for absolute resistance in the same manner as insulators.

### The American Institute.

#### THE TELEPHONE.

Dr. Van der Weyde explained the construction of a new instrument, called the "Telephone," by which certain sounds are telegraphed to any distance. Upon the fact that a magnetic current sent through the wires produced a lengthening and shortening of the wires, and that the vibrations thus produced were musical, and could be made audible by a sounding-board, the inventor based the construction of his instrument. This, as presented by Dr. Van der Weyde, consists of a small box, to which there is attached a speaking tube. In the centre of the lid of the box is a bladder or rubber diaphragm, extremely sensitive in its vibrations to musical sounds sent through the speaking tube. On the diaphragm is placed a platinum wire connected with a battery. Immediately over this wire, but not in absolute contact with it, is another wire, which is connected with a coil and sounding-board placed at any distance—whether in California or two rooms away. When a person sang into the box, the musical wavelets, according to a well-known law of acoustics, produced corresponding vibrations in the rubber diaphragm. This in its turn produced, for every vibration, con-

tact between the two wires. By this means a current was sent through to the coil and sounding-board, where its pitch could be readily distinguished.

Much interest was evinced in the instrument. Some gentlemen went into an adjoining apartment and sang "Yankee Doodle." By placing the ear near the coil and sounding-board already alluded to, which were connected with the instrument by means of wires, the measure could be rapidly distinguished, but in one unvarying tone. The use of the expression "telegraphing sound" must not be understood as conveying the sound as transmitted, as it is by the ordinary conductors. The fact in the case of the Telephone is that a musical note sounded in New York by means of its vibrations sends currents along a wire which, in lengthenings and shortenings, produces another sound in San Francisco or Constantinople. The Telephone will not transmit ordinary conversation. Though imperfect at present, it is believed that it contains the germ of a very important adjunct to telegraphy.

### Galvanic Action of Copper-Bottomed Ships in Dock.

The Elk, 2, twin-screw (composite built) gunboat, 465 tons, 120-horse power, launched during the past winter from Portsmouth Dockyard, and subsequently fitted with her engines and boilers, was placed ten weeks since in the old shipping-basin of the yard, to wait there the finishing of her pair of screws, which were ordered to be cast from enlarged patterns. On Tuesday last she was taken out of the basin again and docked to receive her screws, which had in the meantime been completed for her. On attempting to clean the ends of the shafting, however, to receive the screws, it was discovered that galvanic action had been at work to such an extent that the "key" pieces on the shaftings were reduced to plumbago, and other parts of the metal "honeycombed." The fact appears to be that the small area of water in the old ship basin is but seldom open to the admission of the tide, has always three or four copper-bottomed vessels floating upon it, and is, therefore, a chemical bath, whose power has been so unexpectedly, yet convincingly, displayed upon the screw shafts of the Elk.

### The Telegraph and the Coast Survey.

The United States Coast Survey is now engaged in taking astronomical observations to establish the exact longitude of several far Western cities. For this purpose the telegraph is brought into requisition, and by its aid the desired result can be arrived at to a nicety.

All that is wanted is a cloudless sky at the different points to enable the observers to see the heavenly bodies. Last night the wires of the Western Union Telegraph Company were connected through from Cambridge University, Boston, to Salt Lake City; but owing to the obscurity of the stars at the last named place, no observations could be made, and the experiments were deferred until to-night, when, if the weather proves favorable, it is contemplated to place San Francisco in direct communication with Cambridge. The wires worked splendidly last night, notwithstanding the immense distance. The route was from Boston, via New York, Buffalo, Detroit, Chicago, and Omaha, to Salt Lake City, and only three "repeaters" were used, namely, at Buffalo, Chicago and Omaha.—*Buffalo Courier*, Feb. 6.

NOVEMBER 30, 1868.

To the Editor of the Journal of the Telegraph:

There is no character extant to represent the underscoring of words. Such a character, I think, would be useful. I would suggest the use of . — . — .

Respectfully, M. C. B.

### Rewards for Lengthened Services.

EDITOR JOURNAL OF THE TELEGRAPH:

Among other conditions upon which the telegraph of Great Britain falls into the control of the Government, is the following: That each and every officer and clerk, who has been five years in the service of the telegraph company, will, if he has no offer of appointment from the Postmaster General of equal value to that held by him under the companies, receive, during his life, an annuity, graduated according to the number of years he has been in the telegraph services, but equal to two-thirds of his previous emoluments." Again: in France, after 20 years' service in the telegraph, an addition of 1,000 francs per annum is made where 1,400 francs were previously paid.

It seems to me that these two items furnish a plain recognition of a humane and generous principle, which reflects great credit upon the author or whoever first put it into practice, and one that all employers and corporations might pursue with equal credit and wisdom, namely—that an operator, if prompt, energetic and reliable, is, from year to year, earning something more than his current salary. His chances for promotion are so slight that perhaps not one has yet, when setting out to become an operator, calculated upon reaching any of the few positions worthy of unswerving toil through all one's boyhood and most of one's manhood.

From year to year his services become more valuable to his employer—from year to year he lessens the probability of embarking in other pursuits, and becomes more and more dependent upon his chosen profession, and more and more firmly welded to it.

Without the old experienced operators and managers, the Western Union Telegraph Company would not be the staunch, unflinching structure it is.

In view of this fact, it appears to me that it would be politic as well as praiseworthy to offer some inducement to operators and others to remain in the business after having followed it so long, and of which they have become masters in its every detail, through amassed practical information picked up from month to month.

I should like to see the views of the editor on this subject, without inserting anything from this manuscript, if he perhaps can embody the idea and demonstrate it more clearly than I have.

Very respectfully,

TWELVE YEARS AN OPERATOR.

### A New Machine.

The Philadelphia *Post* thus reports the invention of a new machine which has startled the people of the Quaker City:

"The latest vehicular invention (but still, like a great many late inventions, one of the earliest known) is the property of a Milesian of this city. He calls it a 'wheelocipede.' It has the advantage of only needing one wheel, and is not only one of the most useful of this description of vehicles but absolutely the safest. The operator rests his feet upon the ground, and his whole body upon his feet, and guides the arrangement by means of a pair of bars. It is capable of use in building operations, for the conveyance of earth, sand and such materials, and will doubtless supersede, in the end, all the other descriptions of velocipedes."

### An Electrical Sewing Machine.

A sewing machine driven by electricity may now be seen in actual use in Paris. The foot is now no longer needful; the "hand" has only to direct the needle. The invention, although the machine can only be adapted for the lightest work, may be worthy of attention here.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, FEBRUARY 15, 1869.

### Very Stupid.

The *Press*, of the City of Brotherly Love, is a paper of mark and enterprise, looked up to by many an intelligent reader as the very *beau ideal* of a wise and just journal, and a paper, withal, of which Philadelphia is justly proud. When the discussion of the Postal Telegraph question arose, the papers which have any decided influence on public opinion treated it with a fullness and intelligent comprehension of its bearings, which even strengthened the convictions of those who were most familiar with the argument and most interested in the result of its discussion. On opening the *Press*, however, we were surprised to find a brief and impotent article of a score of lines, tersely asserting that, as it was essential to Government in time of war to have the telegraph under its control, and at such a time a dangerous power in private hands, *ergo*, the whole telegraph system ought to be under Government control.

Now we claim that there is nothing in the prospects of the nation to justify placing the telegraph or anything else on a war basis. We are entering, we gladly believe, an era of unexampled peace and progress. The telegraph must, by its very nature, be the indicator of the nation's enterprise. In private hands it cannot avoid keeping pace with the public necessities. Self-interest will compel it. Wherever a nugget of gold is found, or an oil well pours out its 100 barrels per day, or a horse fair congregates masses of men, the telegraph, by reason of a strong sympathetic interest, quickly finds its way. Now all this in private hands is easy, and natural, and spontaneous. It is a part of the common enterprise, a touch of the popular excitement and enthusiasm which men rub into each other as they rush after new enterprises and fire up the iron horse after new El Dorados. What could Government do in such cases? Restricted by legislation, unsympathetic because of the absence of the stimulus of personal interest, uninfluenced by any fear of the injury which would befall a private company if it refused the prompt provision of obvious necessities or even to anticipate them, public impatience would compel a thousand small lines to be built to do what an isolated red tape authority could never provide.

As to war periods, it is known that in our late struggle the telegraph lines were at once placed in Government control. Government had only to make the demand to secure compliance, prompt and unquestioned. There is no cause for doubting that, under similar circumstances, should they ever unhappily arise, a similar promptitude would be shown. To put a great vehicle of popular intelligence in governmental shackles for a century, in anticipation of their use by the Secretary of War, we regard as wisdom most unwise, and as a fear most unfounded.

In another paper, published in the saline atmosphere of Syracuse, N. Y., as well as in the *Press*, the present controversy is represented as a proposal by Government to *absorb* the telegraph system. It is no such thing. It is partly a proposition to start a Government opposition to existing lines, and partly a Boston job to secure a final monopoly of the whole business. It is in great part a speculation, cunningly netted with patriotic phrases and unmeant philanthropy. To the *Press*, to all the press, it would be a miserable calamity and cheat. The offer to do the telegraph business of the nation *below cost*, proves a

villainy on its face. It is like the offer of a clerk we know to one supposed to be influential in appointments to secure him against dismissal, to give him a monthly sum *equal to his whole salary*. The stealings were his most valuable revenue. When Government, in earnest, offers to absorb the telegraph system of the United States, and public opinion sustains the undertaking, the companies who now control it will be found ready to give up their property on fair valuations of its worth. Meanwhile they intend to oppose all the schemes now pressing acceptance as alike without merit and unjust. In this they will be sustained by the good sense of the nation.

### Telegraph Pensions.

We have received a communication, which will be found elsewhere, referring to the arrangement made by the British Government, by which, when the Telegraph System of Great Britain has been absorbed by Government, all unneeded employees of the defunct private companies are to be provided with pensions. Reference is also made to the system in France by which men who have been long in the Telegraph service are rewarded by an advance of 1000 francs per annum. These are referred to with the suggestion that some similar mode of providing for faithful men, who have served their companies well and long, may be as just in America as in Europe.

The addition of 1000 francs, or \$200, to French salaries of old employees, very commendable as it is, is a good deal dwarfed when it is known that ordinary salaries do not average more than \$300 per annum, if, indeed, so much. The wonder is, that men fit for such employment can be obtained at all on salaries so small. The British arrangement referred to is certainly a just one, for when government steps out of its course to absorb the active enterprises of the nation, and destroy the competition which fed and animated so many men, it was due to them that some consideration be provided for their lost livings. This feature of the recent telegraph movement in Great Britain is certainly refreshing.

It would indeed be a comfortable thing to many of us who have given our strength and heart to the success of the Telegraph in this broad land, could we look forward to a day when a Company could say to us, "Old fellow, you have worked hard and long, your hair is gray, your step has lost its elasticity, your thin bent carcase needs rest, go, take it, and we will fodder you to the grave." But we have no such expectation, and know that it cannot be. Private companies have no seeds of immortality in their organization which can warrant any such provision. They are studying out, daily, the means of self-existence, to which every added dollar gives assurance, and the limitation of our incomes, their possible reduction, the question whether you or I are worth our monthly checks, is the subject of their anxious and constant enquiry. When we die, the first thought may be "poor fellow, he served us well," but the next will be, "is it necessary to fill his place?" "Can't we save the salary he drew?" Could some of us as they carry us to Greenwood or Mount Auburn or Mount Hope come to life a few moments and listen from beneath the plumes which nod above the gilded cart that carries us to our rest, we might hear a bearer ask his fellow:

"Who will take Smith's place?"

And the answer will make our head duck down into a contented coffin:

"Nobody: none needed!"

And all this is natural and necessary. The executives of companies are like the rest of us, men appointed to work, over whom a like economy is practiced whenever possible. Some man can demand position and big pay by reason of fitness and power, but when ill health takes him from his chair, another quickly sits down in it.

So, good friend, we must stomp it out on that line all through. It is one of the hard features of every pursuit, and especially under a free government like ours, that there is no friendship in business, and no gratitude. We are left free to work or starve as we choose. Sometimes a revered man is pensioned by a revering people, but oftener still it is refused because the sense of independence burns even in the ashes of the old age of a man who has battled nobly his own way through life. We could not live thus pensioned, unless for wounds in honorable service which, unhealed, keep up their voiceless service to the state. Give us work, hard work, and pay us for it justly

and proportionately. This is proper expectation. Some demand increase without added labor or experience, and obtain a furlough of most unexpected length, sometimes a "gravestone."

One thing deserves the notice of all just executives, and by none more than in a business like ours. Change of men is ruinous to telegraphic efficiency. The continuance of faithful men is essential to correctness, to safety. When years come to such men, and the value of labor is enhanced by increased experience, we believe it to be wisdom, and duty, and profit, and the last motive is the strongest, to see that such men's services are fairly recompensed. Beyond that, we must "paddle our own canoe." And somehow men, as they grow old, become more sensitive to appreciation. Other sources of pleasure fail them.

"When men once reach their autumn, joys  
Fall off apace, as yellow leaves from trees,  
At every little breath misfortune blows;  
Till left quite naked of their happiness,  
In the chill blasts of winter they expire."

So the courteous compliment, or the added stipend comfort them, at least we are told so, for we are too young to know. But it is a good thing when a man has so husbanded his opportunities that, when age comes, he can let the oar of service go, and say to his old bones, "rest." Not many can do this. It requires a self denial few of us have courage to practice. There is not one man in a thousand who can say to himself, when on the threshold of life, "I will live so far inside of my means that age will find me my own sustainer." Yet this is the road to travel if we would unite present security to a comfortable future.

### A New Mission for the Telegraph.

Allowing some play to the imagination, there are uses to which telegraphing may be applied, which, although obvious, may excite a smile by their audacity. The difficulties in the way are moral, not mechanical. The innovation on established usages would be so great, that no one would dare seriously to propose it, while the ease of accomplishment is in the inverse ratio to its moral impossibility. We are indebted to a number of the Boston *Transcript*, dated more than twenty years ago, for the amusing speculation, which we shall state as concisely as possible. The obstacles to uniformity of religious faith are twofold. The first is found in the diversities of teaching, the second in the diversities of intellects and religious feelings of those who are taught. The latter is a natural obstacle, which cannot be overcome, but by means of the electric telegraph we may reduce the former within narrow bounds. Let us imagine that from some centre archiepiscopal palace wires are laid to each church throughout the land, each denomination having its own central teacher. In every church, when the time for the sermon arrived, the congregation would simultaneously receive by telegraph the same text, each would receive the same explanation of any difficulties that attended the divine utterance, the same exposition would be given to all, the same exhortations, the same encouragements, the same hopes, and it might add to religious fervor to know that the same glad tidings of salvation were at that identical moment being carried on the wings of the lightning throughout the length and breadth of the land. Let it not be thought that the graces of oratory, or the charms of rhetoric would be banished by this practice. It is supposed that the most eloquent divine of each sect would be appointed to the keys (the piano form of instrument being used), and a little practice in reading messages would enable each reader to present to his congregation the productions of his spiritual superior as attractively, so far as regards tone and gesture, as he could his own.

ECLIPSES in 1869.—There will be four eclipses this year, two of the sun and two of the moon. Two of them will be visible on the continent. The first will occur on the 27th inst. A total eclipse of the sun will occur on the 7th of August, and will be visible to North America and Eastern Asia. It will begin at Boston at 5:24 p. m.

### Married.

On the evening of the 7th inst., at the residence of the bride on Washington street, by Rev. Dr. Catell, Mr. W. D. Garrison, operator of the Western Union Telegraph Company at Wyoming, Pa., to Miss Lizzie E. Brown, of Wilkesbarre, Pa.

## Three Deaths.

We have the sad duty to announce the death of three members of the Telegraphers' Mutual Life Insurance Association within a few days of each other.

The first decease was that of J. S. Van Dusen, of the office of the Western Union Telegraph Company at Sandy Hook, which occurred at the residence of his parents at Amboy, N. J., at 10 A. M., January 29. At the time of our writing we have no particulars beyond the bare announcement of his decease.

The second death was that of James A. Allan, of the Western Union Telegraph office at Detroit, a young man who is spoken of by Mr. Colin Fox, the manager of the Detroit office, “as one of our best operators, one I always thought very highly of and whose loss I deplore.” Mr. Allan leaves a wife and one child in quite a destitute state. He died on Monday, February 1.

The third was W. W. Shipman, who has been connected with the office at the Gold Board in New York for the past six years. He died in Brooklyn Sunday morning, February 7, of consumption, leaving a wife and child who were entirely dependent upon his earnings, and who have been supported during his illness by friends of the family.

These deaths impose a duty upon the Executive Committee of the Association which has somewhat embarrassed them in deciding how best to perform it. The rapidity with which one death has followed on another, while it proves the wisdom of such an organization and reveals a sphere of genuine usefulness which all good men will feel proud to be identified with, must startle some, and prove a strain on the means of many more. Such a mortality seems unusual; it seems impossible that so many deaths can again happen within so short a period; and yet the future is sealed, and no man knows whether he or his fellow shall be next. A year may elapse without a single shaft coming with its deadly barb among us, and yet the hand that writes this may be cold in death before these lines reach the eyes for whom it writes.

Were all our members entirely able to meet this triplicate call upon them, the assessment which the committee have to make would be issued without hesitation and with a cheerful knowledge of a great good to be accomplished. But the call for three dollars so soon after the assessment caused by the decease of our brother Winnie, must come severely on those whose incomes are small, and whose expenses are heavy. And yet these are the very ones we desire to be in the association. The poorer the man the more need of the fund to those he leaves behind him. The money cannot be sent without self-denial, but it bears upon it a double blessing. How shall we make it easier for this class of our brotherhood to meet this demand?

After due reflection, the committee have determined to make an assessment of one dollar for each death, to be remitted at monthly intervals should any desire to avail themselves of this delay and take the risk of forfeiting their membership by death before payment is made. Should any feel discouraged by reason of these rapidly succeeding claims upon them and design withdrawal from the association, we beg them to make an effort to remit two dollars for the families thus bereaved and who need the fund they have been led to anticipate from this source. Cut off some unnecessary source of expense which the poorest of us are constantly making, and by the virtue of a felt sacrifice, aid in comforting those who in earth's darkest hour, when desolation drapes the heart in sackcloth and dims the eyes with tears, so much require it.

It is a good time to help each other. Some of us may know a poor brother who cannot meet this assessment, and may be able to aid him. Let us all do what we can, and each receive the benefit of a good deed cheerfully done, and which we ourselves may so soon require.

## A Timely Benefaction.

On notice of the three deaths recorded in the foregoing column, we informed the President of the Western Union Telegraph Company of the facts, and are delighted to receive the following prompt response from the Executive Committee of that Company.

This handsome and timely gift will render it only necessary to collect two dollars instead of three from the members of the Association, and must impress all with the conviction that beneath the rigor necessarily connected with executive management, there exists a true and hearty sympathy between those who direct the common labor and those who perform its more subordinate toils. May this sense of brotherhood ever increase.

TREASURER'S OFFICE,  
WESTERN UNION TELEGRAPH COMPANY.  
NEW YORK, Feb. 15, 1869.

J. D. REID, Esq.—Dear Sir: Your communication in respect to the Telegraphers' Mutual Life Insurance Association and announcing the extraordinary fact of the death of three of its members within a brief period has been duly considered by the Executive Committee.

The Committee heartily commend the beneficent object of the Association, and think it should be encouraged and fostered. It seems to be eminently calculated to promote mutual sympathy and good feeling among a most worthy and deserving class of men, and we hope it will be generally availed of by the operators. The assurance to those who have families or friends dependent upon their personal labor, that their loved ones will not be left wholly destitute in the event of sudden and unexpected death—and no one knows when that may come—should be sufficient inducement to membership by the entire body.

As an expression, on the part of the Company, of its appreciation of the noble objects of your Association and of its sympathy for the extraordinary calamity that has so suddenly fallen upon it, the Committee have authorized me to contribute to your treasury the sum of four hundred dollars; and it affords me pleasure, in pursuance of such authority, to enclose check for that amount herewith.

Yours truly,

O. H. PALMER, Treas.

## The Sabbath Question.

A correspondent complains of the present Sunday hours, but we think without reason. The hour in the morning, we presume, is made early, to enable the receipt of messages arriving late at distributing offices the night before, and to enable the lines to be entirely clear of all business before the hour of closing arrives at 10 A. M. Some allowance has also to be made for the distances messages have to travel, and the difference of time, which often practically makes one hour out of two.

As to the nature of messages to be received on Sunday, we cannot see how a discrimination can be made. If the office is opened at all, every man has an equal right to use the wires, and, in transmitting, an operator seldom pays any heed to the contents of the message he sends, and few can tell the succeeding hour what any of those he has sent contained. We believe this to be true, while we admire the tenderness of any conscience which shrinks from what seems a wrongful profanation of the day. This delicacy of conscience, however sneered at, is a test of character of the utmost value to a business requiring fidelity and devotion such as this, and ought to be protected in every way possible. It must not be forgotten, however, that it is difficult to decide all that a message may mean to the parties concerned. It may, in some cases, be the most real mercy to send that message which seems most objectionable. The door must either be open or closed to all.

The evening hour we regard as the most important, because many of the messages then left have reference to parties who are required to leave on early trains, by reason of deaths and sicknesses which have occurred during the day. The noon hour would be useless for half of

such cases. A large proportion of Sabbath messages are of this character, and the hour must be sufficiently late to give opportunity to all whose exigencies or whose sorrows lead them to our offices. To be able to perform any such service for any sufferer, to relieve a single anxiety, has a richer compensation to a true heart than the pleasure of listening to the healthiest and most eloquent sermon ever uttered. Christianity educates the heart to active charity, as well as to inward purity, and it is a poor sermon which does not stimulate the hearer to generous sacrifice for the sake of others. Yet, if it could be done in justice to all, and were this weary world of ours purged of its griefs, we would be glad, exceedingly glad, to have every door closed during the entire day, and we again express our sincere desire for the utmost reduction of service consistent with public duty.

## The Herald Misrepresentations.

MR. ORTON'S LETTER.

OFFICE OF THE WESTERN UNION TELEGRAPH CO.,  
NEW YORK, January 26, 1869.

To the Editor of the Herald:

Will you do me the justice to permit a correction to be made of so much of an editorial in the *Herald* of the 25th instant, headed “Telegraphic Yankeeism—A Mean Job,” as relates to myself? So far as I am concerned, either personally or in my official relations to the Western Union Company, your references to me are based upon wholly erroneous assumptions.

I never had anything to do with procuring the passage of the bill through the New York State Legislature granting to William Orton, Charles C. Leigh, Charles Harvard and their associates the sole and exclusive right and privilege to land and operate telegraphic cables upon the waters, lands and shores over which the State of New York has jurisdiction. The insertion of my name in that bill was without my knowledge or consent, and, at the first meeting of the grantees, after the bill had become a law, I declined to take any part in the organization of the company to be formed and operated under its provisions, and assigned, without consideration, present or prospective, whatever right, title, or interest, therein had been conferred upon me to the other parties named therein.

This being true, your assertions, insinuations and inferences, connecting me with negotiations for the sale of this grant to the Franco-American Telegraph Company, or to any other parties, are wholly erroneous. I have had nothing to do with any negotiation for its sale, have not had, have not now and never expect to have, any interest, directly or indirectly, in the result, pecuniarily or otherwise.

Permit me, in this connection, to correct another erroneous statement which the *Herald* has several times made, and which is reiterated in the issue above referred to. The Western Union Company has had nothing to do, directly or indirectly, with the bills and resolutions introduced recently into the Senate of the United States proposing to regulate the landing, upon the shores of the United States, of submarine cables connecting foreign countries. Neither myself, nor any person in our behalf, has had any conversation or communication with any Senator or other person, concerning them or the subjects to which they relate. It is a mistake to suppose that our interests would be affected unfavorably by the laying of telegraphic cables between this and other countries. At all events, we have not interfered, and do not propose to interfere in the premises either on one side or the other.

Equally unfounded were your recent statements connecting the Western Union Company with the scheme now pending in Congress to secure the Government endorsement to several millions of the stock or bonds of a company proposing to lay submarine cables between the Pacific coast and China and Japan. The truth is, Mr. Editor, you have been grossly deceived in all these matters. We are not, and do not propose to become, partners in any jobs, either before Congress or elsewhere. We are, however, opposed to the construction of telegraph lines by the Government where none are needed, and to giving to private parties Government aid to enable them to set up in business as our competitors.

I refrain from referring to and refuting many other errors which the *Herald* has published concerning the Western Union Company, because this card is already longer than I desired to make it, and because the public can have little interest in the details of our private affairs.

I am, very respectfully, &amp;c.,

WILLIAM ORTON.

## Journal of the Telegraph.

### Genius Will Out.

An operator, whose buttons had given out, and whose nether garments were in an advanced condition of lassitude, wanted leave of absence to attend to his dilapidated costume. His name was Catlin, which suggests a feline specimen of homo. But Catlin is neither of cat nor cow, but a poet, and whose name should be sounded softly, as should all true poet's names, till it sighs into "Kathleen." Knowing chief operator Downer's love of neatness, and urged by the dangers attending his over-ventilated garments in these cold days, "Cat" sent up the following petition, which, of course, was at once granted, and "Cat" released to attend to his buttons:

To the Chief Operator:

When Senators have had their say,  
And ceased proceedings for this day,  
I would *thou* might'st turn and say—  
"Cat! Thou hast nobly done—away."

A vest, with buttons badly worn,  
A pair of pants, from stooping torn,  
To tailor, ere it's dark, must go—  
For, after dark, he cannot sew.

Please answer. Yours,

### The Washington Office.

The Western Union Telegraph Company have secured a long lease of the ground floor of the building on the corner of Pennsylvania avenue and Fourteenth street, and of the adjoining lot on Fourteenth street, and are now engaged in tearing down the old building preparatory to the erection of a substantial structure on its site. That portion of the ground floor, 30x34 feet, fronting on the avenue, will be devoted to the reception of messages, while the room on Fourteenth street, directly in the rear, 31x45 feet, will be assigned to the use of the delivery, record and other clerks. The room over this will be used exclusively as the operating room.

Each floor will be fitted up with all the modern improvements, including speaking-tubes, dummies, etc. The third story will contain the batteries. The office will be removed as soon after the 4th of March as the pressure of business will allow. The Company do not mean altogether to abandon the eastern portion of the avenue, but will maintain an important branch office at or near their present location.

Since the location of this office ten years ago great advance has been made in the telegraph business. At that time there were thirteen wires running from this city connecting with the various sections of the country. Now, this line alone has thirty-five wires connecting us with nearly all parts of the world. This is exclusive of the wires of the two rival lines and its own branches, which are numerous.—*National Republican*.

[The Washington offices of the Western Union Telegraph Company are under the management of C. A. Tinker, Esq., who has executed his very laborious and delicate duties with a skill, good judgment and firmness, worthy of all praise. No manager stands in higher esteem with the Company he so ably serves, and Mr. Tinker enjoys the respect of all who have to transact business at the offices under his charge.]

### Genius.

Alexander Hamilton said to an intimate friend: "Men give me some credit for genius. All the genius I have lies just in this: when I have a subject in hand, I study it profoundly. Day and night it is before me. I explore it in all its bearings. My mind becomes pervaded with it. Then the effort which I make the people are pleased to call the fruit of genius. It is the fruit of labor and thought."

Mr. Webster once replied to a gentleman who pressed him to speak on a subject of great importance: "The subject interests me deeply, but I have not time. There, sir," pointing to a huge pile of letters on the table, "is a pile of unanswered letters to which I must reply before the close of the session (which was then three days off). I have no time to master the subject so as to do it justice."

"But, Mr. Webster, a few words from you would do much to awaken public attention to it."

"If there is so much weight in my words, as you represent, it is because I do not allow myself to speak on any subject until my mind is imbued with it."

Demosthenes was once urged to speak on a sudden and great emergency. "I am not prepared," said he, and obstinately refused.

The law of labor is equally binding on genius and mediocrity.

### Memories.

Who among the Canadian operators in Uncle Sam's dominions does not remember with gratitude and esteem the only man who ever bore the title of Eastern Superintendent of the Montreal Telegraph Company? A "canny Scot," gifted with all the peculiarities of his race, kind, unassuming and warm hearted, none of us who ever worked under him can, I feel assured, ever forget his many kindnesses to his operators.

Some half dozen years ago, the cable across the St. Lawrence River from Etchemin to Sillery, some half dozen miles above "ye ancient capital" Quebec, was broken by the dragging anchor of some vessel, when the aforesaid gentleman having chartered the powerful little tug "Storm" and a *batteau*, and having made all necessary arrangements, we jumped into one of those old-fashioned vehicles termed *caleche*, which I believe a restill in vogue in the Province of Quebec, and were soon whirling along around Cape Diamond, where the gallant Montgomery fell, *en route* to Sillery. Having arrived at that cove, tested and found the break in the cable near the middle of the river, the worthy Superintendent, who was sitting on the side of the *batteau* intently engaged in repairing the trouble, did not notice the swell caused by a passing steamer, and hearing a splash the batteauxmen and myself were made speedily aware of the fact that our chief was enjoying a very unpremeditated bath in the clear blue water below. For a few moments all was consternation, but, being an able swimmer, the superintendent breasted the swift current, and clutching a rope hanging from the stern of our craft, was dragged on board, looking more like a monster of the deep than anything human. A thorough drying by the cook's fire soon set matters to rights. The cable was mended and relaid, and on our arrival at Quebec we had the satisfaction of hearing "steamer news"—which was then looked for with great interest, there being no ocean cable in those times—passing over the wires which had so nearly proved fatal to one of the best of men, and one of the kindest hearted of our telegraphic fraternity.

LEW OGDEN.

A GHASTLY scientific discovery is reported from Turin, where Professor Gasturani, the celebrated oculist, has found a way of killing animals by forcing air into their eyes a few seconds, and almost without causing them pain. Experiments were recently made at the Royal Veterinary School, and it is said that they have fully proved the truth of the professor's invention. Within the space of a few minutes four rabbits, three dogs and a goat were killed in this manner. The most remarkable fact is that the operation leaves absolutely no outward trace.

## Telegraphers'

### Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## Chief Justice Chase on the Triumph of Christianity.

On Sunday evening, the 11th inst., before a large and fashionable congregation at one of the Washington churches, the Chief Justice of the United States delivered a lecture on the subject of "Christian Missions." From the outlines of the lecture, it seems to have been scholarly and philosophical, full of hope and confidence as to the final success of Christianity. The Chief Justice on the rostrum within consecrated walls must have been rather an interesting and edifying sight. And it must be admitted that the shadow of Christianity overspreads the nations. Everywhere it is felt to be a great and growing force. It is already the controlling power of the world. Wherever there is progress, energy, enterprise; wherever there is true freedom, culture, intellectual independence, there is Christianity—and of all these she must be regarded as the parent and the nurse. From Christianity have they sprung and on Christianity do they depend. What have the non-Christian two-thirds of the human family given us during these last ten centuries in the shape of literature? Absolutely nothing. We are not forgetful of the literary outburst of infidelity which preceded and followed the French Revolution; but this we claim for Christianity quite as much as anything ever written in its defense; for it sprung out of Christianity, and some of the literature of that period is more Christian than either its authors or its enemies believed. What have the non-Christian two-thirds done for us in the shape of mechanical invention? Absolutely nothing. The steam engine, with its countless applications, the electric telegraph, the printing press—all these modern forces which are revolutionizing the world, which are breaking down the barrier walls of nations, which are bridging the mighty waters, piercing the everlasting hills, annihilating distance, creating a common sentiment and common interest worldwide in their range—have they not all sprung from, and are they not all allied to, Christianity?

Such are facts of which Christianity has just cause to be proud. If we turn aside from these facts for a moment and look at what we may call the dominant tendencies of the age we find equal reason to be proud and hopeful. Prominent among these must be noticed the aggressiveness of Western civilization. The civilization of Europe and America marches with rapid strides and is making itself felt in all lands and on every sea. Not only have the millions of Asia ceased to send forth their conquering hordes; they no longer feel it possible or prudent to resist the aggressive energy of these Western forces. With Europe on the one hand and America on the other the day is not far off when the Asiatic Continent in all its length and breadth shall be revolutionized, transformed, regenerated by what it is still the fashion to call Western civilization. This civilization is nothing if it is not Christian. With the railroad, the steamboat, the steam plow and other mechanical appliances developing the wealth and utilizing the products of the Continent; with the printing press and the electric telegraph quickening thought and facilitating expression, the doctrines of Christianity will be more successfully preached than they have ever been by any missionary in any age. As it will be with Asia so will it be with Africa, so with every island of the sea. The tide of Christian civilization will roll on. Where it is accepted it will remain and bless. Where it is resisted it will roll on and destroy.

CONCEIT.—There is one thing worse than ignorance, and that is conceit. Of all intractable fools, an over-wise man is the worst. You may cause idiots to philosophise; you may coax donkeys to forego thistles; but don't think of ever driving common sense into the head of a conceited person.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
FEBRUARY 15, 1869.

To all Offices on W. U. Lines:

The following changes have occurred since February 1, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Andover, Conn., tariff same as Willimantic, Conn.  
Avoca, Ala., tariff same as Blue Mountain, Ala.  
Black Buttes, Wy. T., tariff same as Point of Rocks, Wy. T.  
Butler, Ga., re-opened, tariff same as heretofore.  
Delanco, N. J., tariff same as Bordentown, N. J.  
Florence, N. J., tariff same as Bordentown, N. J.  
Harford, N. Y., tariff same as Harford Mills, N. Y.  
Hillville, Pa., tariff same as Brady's Bend, Pa.  
Hyde Park, Mass., tariff same as Walpole, Mass.  
Letohatchee, Ala., tariff same as Greenville, Ala.  
Loachapoka, Ala., tariff same as Opelika, Ala.  
Mahoning, Pa., tariff same as Brady's Bend, Pa.  
Mounmouth Junction, N. J., tariff same as Bordentown, N. J.  
Princeton Junction, N. J., tariff same as Bordentown, N. J.  
Spottwood, N. J., tariff same as Bordentown, N. J.  
Washington, R. I., tariff same as River Point, R. I.  
Wheeling, Mo., tariff from offices heretofore known as Caton offices will be according to "Map Tariff." From all other offices tariff same as Chillicothe, Mo.  
Richmond, Mo., and Lexington Junction, Mo. Tariff from Caton offices according to "Map Tariff." Other offices tariff same as Lexington, Mo.

Bigelow, Mo.,  
Craig, Mo.,  
East Nebraska City, Mo.,  
Pacific, Mo.,  
Tariff from Caton offices according to "Map Tariff."

From all Caton offices South and East will be 20 cents for Bigelow and Craig, 35 cents for East Nebraska City, and 45 cents for Pacific added to their rate to St. Joseph, Mo.

From offices North and West their tariff to St. Joseph less the same amounts.

## OFFICES OPENED ON OTHER LINES.

Bigler, Osceola and Sandy Ridge, Pa. Tariff 40 cents from Lock Haven, Pa.; 50 cents from Harrisburgh and Pittsburgh, or 60 cents from Philadelphia. Offices between Erie and Scranton on Philadelphia and Erie, and Lackawanna and Bloomsburgh Railroads will check and send business to Lock Haven. All other offices will check and send business to Pittsburgh, Harrisburgh or Philadelphia, whichever route will give the lowest rate.

## OFFICES CLOSED.

Armstrong, Pa., Blue Mountain, Ala., Forest, Miss., Petroleum, W. Va., Sulphur Springs, Wy. T., Point of Rocks, Wy. T., Green River, Wy. T., Cooper's Creek, Wy. T., Gilmer, Utah, La Plata, Mo., and De Soto, Ill.

## GENERAL INFORMATION.

On and after February 20, the tariff to Toledo from offices having "Special Sheet A" will be as follows:

Offices between Buffalo and Rochester, including Rochester, 85 cents.

Offices between Rochester and Syracuse, including Syracuse, \$1.00.

Offices between Syracuse and Albany and Troy, including Albany and Troy, \$1.15.

Offices South and East of Albany and Troy in New York State, except New York City, \$1.20.

Offices in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut \$1.00 more than their "special rate" to New York City.

Offices between Pittsburgh and Harrisburgh, including Harrisburgh, \$1.25.

Offices between Harrisburgh and Philadelphia, \$1.40.

Offices sending business for Toledo via Philadelphia, except Baltimore and Washington, \$1.40 more than their "special rate" to Philadelphia.

Skaneateles, N. Y., will hereafter be checked by all offices having "Special Sheet A" at same rate as Syracuse, unless otherwise ordered.

Messages for Hamilton and Treasure City, White Pine District, Nevada, will be forwarded by stage, daily, from Jacob's Wells, Nevada. Tariff same as to San Francisco, Cal.

## IMPORTANT.

Hereafter a clear description of the location of new offices opened must accompany the notice which fixes the tariff, particularly the distance of such offices from other offices on either side must be stated so that they can be correctly plotted down on the map in this office.

As the JOURNAL goes to press on the 15th and 30th of each month, it is absolutely necessary that information requiring insertion should reach this office at least three days in advance of publication. It is frequently received on the very day, and hereafter will have to lay over if it is not in time.

WILLIAM ORTON, President.

**The Cooper Union—Telegraph School for Women.****RULES AND REGULATIONS FOR ITS GOVERNMENT.**

The term commences on the 15th day of February and ends on the 1st day of July, 1869.

Applications will be received during the month of February, and must be made in the handwriting of the applicant. Examinations for admission will take place on Fridays only at 11 A. M.

Applicants must be at least 17 years old, and not over 24. Satisfactory reference as to character is required before they can be admitted as pupils.

Any pupil absent three times without satisfactory excuse, forfeits her position in the school. Pupils absent from sufficient cause, and who wish to retain their position, should make such declaration in writing to the Manager, before three absences are recorded against them.

Pupils are not permitted to leave the school when in session, except by permission of the Manager.

Visitors to pupils will not be admitted except by special permission of the Manager. Visitors to the Institution will be admitted with a ticket from the Curator, on Fridays.

The school hours are from 9:30 A. M. to 3:30 P. M. Pupils must be particular to arrive on time, as they will not be admitted after the opening hour, except in special cases by permission of the Manager, who will report the circumstances.

Pupils wanting in diligence, or whose deportment is exceptional, or who are proved not to be adapted for the business, will not be retained in the School.

Pupils are not required to pay any entrance fee, and the instruction is gratuitous.

As only a limited number of pupils can be admitted to the school, preference will be given to those who by education and physical ability appear best qualified for the business.

Only pupils who are prepared to accept situations out of the City of New York as soon as they are qualified, can be admitted to the school.

ABRAM S. HEWITT, Secretary.

VINCENT COLYER, Curator.

WHITE HALL, Ill., December 20, 1868.

**EDITOR JOURNAL OF THE TELEGRAPH:**

Having a desire to know if a telegraph line extending round the world in one solid line without any ground connections will work with a single wire. A friend operator contends that it will work same as two wires as the circuit combined makes the circuit. I contend it is no more than one wire, and will not work unless connected with the earth. Please answer through the JOURNAL and omit my name.

Yours, OPERATOR.

NOTE.—We fear the enquiry above may afford some amusement among old heads, but we are too ignorant of many things ourselves to treat it with the least disrespect. We would ask our Whitehall friend what is the difference between a wire going to the outskirts of Whitehall and back again, and one going round the whole village? The world is only a large Whitehall, and a wire passing round it continuously will work just as well if the wire is large enough, and all the conditions of insulation and battery be given suitable for such a circuit, as if it went half round and returned by a second wire on the same poles.

**Born.**

At Boston, on the 12th inst., a daughter to H. S. Martin, Esq., night manager of the office of the Western Union Telegraph Co.

THE Senate Postal Committee will recommend some features of the Hubbard Postal Telegraph Bill, and the Committee of the House will report against them all.

**New Lines to New Gold Regions.**

We have received the following message dated  
JACOB'S WELL, Nevada, February 8, 1869.  
JOHN HORNER, New York:

Dispatches for Hamilton and Treasure City, White Pine District, direct via Jacob's Well. Tariff same as San Francisco. We will have lines completed in about six weeks. Meanwhile dispatches go by stage daily in about twelve hours. Mining excitement very great. Twenty or thirty thousand people will go there in the spring.

JAMES GAMBLE, Superintendent.

**Telegraphers' Mutual Life Insurance Association.**

ASSESSMENTS RECEIVED.

W. H. Stanton, C. E. Higdon,  
J. H. Purnell.

MR. POPE's book on "Modern Telegraphy" will be ready early in March.

**SPECIAL NOTICE.**

L. G. TILLOTSON & CO.,  
11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their:

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES.

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**BENEDIOT BROTHERS,**

No. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

**SPECIAL NOTICE.**

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDIOT BROTHERS,

Agents for the American Waltham Watch,  
691 Broadway.

**DURANT'S**

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platina point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Rathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight: alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-900th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine	\$19 50
Small Box Relays	16 00
Same in Rosewood	17 00
Medium Box Relays	17 00
Same in Rosewood	18 00
Large Box Relays	18 00
Main Sounders same as the above, with heavy armature lever, without local connections	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys	22 00
Excellent Registers	40 00
Pony Sounders	6 75
Keys	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

## DEAD.

"Old Mother Hubbard went to her cupboard,  
To get her poor doggie a bone;  
But when she got there, the cupboard was bare,  
And so the poor doggie got none."

—Nursery Rhymes.

As we announced in our last number, the Congressional Committee on the Postal Telegraph bill, embracing the schemes of Mr. Hubbard, of Boston, and others, to relieve existing Telegraph organizations of the labor and care of providing the means of communication for the American people, have reported adversely to all these projects, leaving the management of the Telegraph in the hands of those who have nursed it to its present greatness. This decision was unanimous. It could scarcely have been otherwise. Seldom have proposals so selfish been made the subjects of so much careful scrutiny, and so much merited the repudiation they have received. Let us hope they are now buried, face downward, and engraven on their backs, in deep broad characters, the words "NO RESURRECTION."

## THE POSTAL TELEGRAPH.

### ADVERSE REPORT ON THE DIFFERENT SCHEMES PRESENTED TO THE HOUSE.

WASHINGTON, Feb. 24.—The House Committee on Post Offices and Post Roads have rendered an adverse report on the several schemes of Mr. E. B. Washburne, Mr. G. G. Hubbard, and Mr. J. F. Hall for the establishment of Postal Telegraphs.

The Committee began their report by a careful analysis of each of the three bills under discussion, and followed it up by the general considerations applicable to the whole subject and the special objections to which each of the proposed measures are open.

Mr. Washburne's scheme is to establish a four-wire experimental line from Washington to New York, to be operated in connection with the Post Office Department by persons wholly in the Government employ. The bill fixes a uniform tariff of one cent a word exclusive of date, address, or signature, with five cents additional for postage and delivery. It appropriates for the construction of the line \$75,000, which in an accompanying paper Mr. Washburne thinks ample to construct the line and to sustain it until it becomes self supporting. If successful and remunerative to the Government, the lines to be gradually extended to all parts of the country.

Mr. Hubbard asks for the passage of a law which, by one act of legislation, should create a new branch of public service—the Postal Telegraph system—and also grant a charter to himself and his associates as the United States Postal Telegraph Company, authorizing them to erect and maintain lines of telegraph all over the States and Territories, with the right to enter upon and occupy post roads and routes, cross the public domain, navigable rivers, &c. The bill fixes the tariff of messages at a maximum of 20 cents for 20 words, including date, address, and signature, for each distance of 500 miles or fractional part thereof;

five cents to be added for postage and delivery. The Post Office Department is, however, to do every thing but supply the wires and other telegraph machinery, which are to be supplied and operated by private parties under contract with the Department, at rates not exceeding those specified. The receipt and delivery of messages, office room, fuel, lights, blanks, stationery, bookkeeping, the superintendence of the lines, are all to be at the expense of the Government. The contractors are to be required only to establish lines and do business at towns having a population of 5,000 or over, though the Postmaster General may open offices at halfway stations, and at smaller intermediate places. Both the corporation to be created under the act, and any existing companies, may bid for the contract, and in case no better offer is received, the United States Company is required to accept a contract at the rates established, if the same is tendered by the Postmaster General within six months from the passage of the act, on penalty of forfeiting their charter.

Mr. Hall's bill, introduced by Mr. Van Horn of New York, is for the construction of a line between Washington and Boston, under the direction of the Post Office Department. The line to be built by Mr. Hall and his associates, over and upon any line or route of travel by post office road, or otherwise by railroad, and the bridges of all kinds, over streams and rivers used, or that may be used, as mail routes of the United States; and that said party or parties shall be protected in the construction, erection, preservation and use thereof upon the lines or routes above designated; said line or lines to be built of metallic poles and air cables. The tariff between any two points on the line to be one cent a word, counting date, address, and signature. The owners of the lines are to have the right to import any materials suitable for the construction and working of it, including poles, wires, instruments, &c., free of duty. After three years' successful operation of the line, the Government is required to buy it at its cost and 7 per cent. interest. With regard to the general subject of assuming the telegraph, the Committee advert to the fact that in the infancy of the invention, Prof. Morse offered it to the Government, and an experimental line was established between Baltimore and Washington, and operated by the Post Office Department; that upon the working of this line and the propriety of assuming the business, the Postmaster General, at the request of Congress, made an adverse report, and the business was thereupon remitted to the hands of the people and the legislation of the States. After a lapse of more than twenty years, when the system had grown to vast dimensions under the authority and protection of State laws, and by force of private energy and capital, the subject was in 1866 again brought before Congress by an application for a private act to incorporate a telegraph company, and also by the introduction of a bill to create a postal telegraph system. These propositions received the fullest attention and elicited much debate, especially in the Senate. The opinion of Postmaster-General Dennison was again invoked, as in 1845, and he reported against the inauguration of the

proposed system of telegraphs as part of the postal system, not only because of its doubtful financial success, but also its questionable feasibility under our political system. The result was a denial of legislation of a private or personal character, and the passage of a general law extending to all telegraph companies then existing or to be in future created by State laws, rights of way over the public domain, over post-roads and routes, and across navigable rivers, upon conditions that they should grant the privilege of use of the line to the Government officers on public business, at rates to be fixed by the Postmaster General; and also agree to sell their entire lines and property to the Government, at an appraisal, at any time after five years. All the leading companies accepted this act, and are now subject to its obligations; and in two years from July, 1869, the Government will have the right to take the lines and property of any or all of them, at an appraisal of their fair value at the time of their appraisal. The purpose of this act was obviously to set at rest the controverted question of the telegraph control management. By it, Congress refused to interfere with the legislative control of the business heretofore exercised uniformly by the States, for the reason that if both Congress and the State legislated about it, there would be an unavoidable conflict of jurisdiction. On the other hand they extended to corporations created by the States certain valuable privileges on condition that the Government might at a future time, if it desired to assume the business, obtain possession of the property by paying a fair price for it. The act when accepted created a compact between the Government and the corporations, and the reasonable construction of that compact is that during the period of the obligation the Government should do no act which would impair the value of the property over which it held the suspended right of purchase. Such a compact as this, if between private parties, would be enforced in its spirit and in its letter by the courts, and Congress will not deal less justly with its citizens than the law requires them to deal with each other. This mode of acquiring the telegraphic property and business, is precisely that pursued by Belgium and England, which acquired it by negotiation and purchase of private companies.

Mr. Washburne's plan is not calculated to succeed for several reasons. The appropriation for it is entirely inadequate. The Bankers and Brokers' line is a substantially built four-wire line between Washington and New York, and therefore exactly corresponds to the proposed experimental line of Mr. Washburne. The capital stock of that Company is \$1,000,000, of which \$750,000 has been paid in by its stockholders. The President of the Company, in a communication addressed to the Committee, states that with the exercise of the utmost economy and diligence, and with the very best of customers, the line cannot at existing rates be made to pay more than its operating expenses, and has never paid dividends or interest upon its cost. There are already three lines between Washington and New York, and a fourth is building. When the Government enters the field it will encounter a competition of not less than 30 wires, and in that com-

petition its lines must go to the wall; for however unremunerative the tariff may be, private companies may make up their losses out of other lines which they own in other territory, while the Government must meet its deficiency out of the public purse. The effect would be to make low rates between Washington and New York, at the expense of higher rates everywhere else. Short experimental lines competing with sections only of great and ramified private systems, cannot be otherwise than failures. Two systems, one public and the other private, cannot work together with success to either, or with benefit to the public. The functions of the Government are necessarily exclusive, and, when once assumed, private parties cannot be allowed to exercise them, and must be rigidly excluded, as was the case with the private expresses which attempted to carry the mails.

Both Mr. Hubbard and Mr. Washburne rely on the examples of Belgium and Switzerland; but there is no similarity between the condition of those countries and that of the United States. Belgium has the densest population of Europe, nearly four hundred to the square mile, while the United States has but ten to the square mile. Belgium is less than a quarter part as large as New York, and yet its population is double that of Ohio. It lies midway between England, France and Germany, holding the closest relations with each. Its business is largely manufacturing; it owns and operates the Railway, Telegraph and Post Office together, most of the telegraph offices being at railway stations. It has recently established a very low tariff for such of its home business as requires no extraordinary dispatch, viz.: half a franc, or about fourteen cents of our currency. There are, however, instances of as low rates in the United States. Thus the tariff between Washington and Baltimore has for a considerable time been only ten cents, and the distance is fully equal to the average Belgian distances. This is not supposed to be a remunerative rate, nor is the inland tariff of Belgium thus far remunerative. In 1866 and 1867 the Belgian telegraph service showed a loss of 309,000 francs, and this would have been much greater had it not been for the receipts from international and transit business, having one or both of its termini out of the country, which yielded a revenue of 1,147,000 francs against 890,000 francs from domestic messages. There are only 374 offices in Belgium, and if all the domestic messages sent in 1867 were divided between them, it would give only six messages to each for each day in the year, and at half a franc these would give a gross revenue of 84 cents in our currency, or less than the wages of the lowest class of American operators. Switzerland is smaller both in occupied territory and in population than Belgium, but it is annually invaded by an army of pleasure-seeking travelers, who use the telegraph for their various wants as it is used no where else in the world. The Government controls the expresses as well as the telegraph, and with quite as much propriety. Both in Switzerland and Belgium labor is cheaper than any where else in Europe, and does not average half the price of the United States. Labor constitutes 60 per cent of the cost of operating the American lines. A far juster comparison would be with the whole of Europe. Distances are shorter than in this country, and although the lines traverse the territory of many nations, there are no national boundaries on the telegraphic map. The whole number of messages sent in Europe in 1866 was 18,683,000, and the sum received \$10,329,000 in American gold, or \$14,461,000 in currency at 140. This makes the average cost of these messages at 77 1-3 cents. The Western Union Company, which does about nine-tenths of the American business, and which alone furnished statistics to the Committee, for the year ending June 30, 1867, transmitted 10,068,000 messages, and received for the same \$5,739,000, equal

to 57 cents a message, and in that number is not included the vast amount of railway business, nor the regular dispatches to the press, in which the number of words delivered were 295,000,000, equal to 14,725,000 messages of 20 words each. In Europe the press dispatches are not a tenth part of those of this country. The number of offices to population is vastly greater here than in Europe. In Prussia there is an office to every 33,000; in France, one to 32,000; in Great Britain, one to 14,000; in Belgium, one to every 12,000; in Switzerland, one to every 10,000; and in the United States, one to every 7,500; in the Pacific States, one to every 2,500. So to the use made of the telegraph America stands pre-eminent. In France the number of messages sent is one to every 13 persons; in Prussia, one to every nine; in Great Britain, one to every five; in Belgium and Switzerland, one to every four, and in the United States, one to every two and a half.

Mr. Hubbard's scheme is not for the establishment of a strictly Governmental line. He asks for a charter to enable him and his associates to incorporate and operate a branch of the public service which is to be created by the same statute. He proposes to do the work of sending messages by contract, likening it to the carrying of the mails. He avows that he expects to make a profitable business of it, and hopes the Government may make something also. What right or propriety is there in granting him a charter? Congress decided against all such grants in 1866; and there is no new element in the situation which would justify the reversal of that decision. There are no petitions from the people, no legislative resolutions, and the voice of the press is not pronounced in favor of any such scheme. A part of the press is dissatisfied with the existing arrangements for the collection and transmission of news; but it is not claimed that the prices charged by the telegraph companies are unreasonable. On the other hand, many of the most influential journals are openly opposed to any meddling with the telegraph by the Government. The National Board of Trade, convened at Cincinnati in the Autumn, voted against the Postal Telegraph scheme. The constitutional right of Congress to grant a charter to a private company to build telegraph lines within the States, without their consent, is very questionable. Except banks, as a part of the public fiscal system, it has chartered no private corporations to act in the States. Congress is asked in this bill to confer on Mr. Hubbard and his associates the right of eminent domain; a right which the Federal Government never exercise, if it possesses it, even when it desires to acquire land in the States for purely public purposes. If it wants land for a fort, a navy yard, a light house, or a post office, it applies to the State for leave to purchase and for a transfer of the jurisdiction. If the State consents it passes an act which not only passes the jurisdiction, but also provides for the expropriation of the land under its right of eminent domain. In case the owner will not consent to sell, Congress is not likely, in behalf or for the profit of private parties, to exercise powers which are not exercised for the most necessary public purposes. Though it may be claimed that the United States Postal Telegraph Company is to be virtually a public corporation, because it is designated to aid in the performance of public service, it really has no title to be so called, as the business is essentially a private one, not hitherto done by the Government, and to be still shared by private companies. An extremely objectionable feature of the proposed postal telegraph system is the right to secure priority in the transmission of messages by paying an extra price for it. The rule of all American lines is: "First come, first served." Any other rule would destroy the usefulness of the service, and transform it into a pernicious engine of speculation. Mr. Hubbard's scheme

violates a radical principle in respect to Government works. Whatever service falls within the proper functions of the Government, should be performed by it immediately, and not through the intervention of private parties, reaping an intermediate profit. It is a proper subject of taxation, and the whole revenue which it yields belongs to the Treasury. No company looking for ten per cent. dividends can be allowed to intervene. The contract system for carrying the mails does not violate this principle. The postal system does not consist only or chiefly in carrying locked mail bags; that is transportation merely, and an entirely mechanical and subordinate part of the system. The Government has no occasion to build railroads for the transportation of its mails, because they already exist for the much more important business of carrying freight and passengers. But the transportation of a telegram over the wires is the essential element of that service to which all the skill and all the responsibility attaches, and it cannot be done successfully except under an immediate responsibility to the party sending. This responsibility the servants of a contractor would never fear. Mr. Hubbard's scheme mixes the service and the servants of the contractor and of the Government in such a manner that the public will fall between two stools. How is this system to be made profitable to the contractor? It can only be by putting nearly all the cost upon the Government. The cost and maintenance of lines and the wages of operators are all that fall on the contractor; all the rest must be borne by the Government. When it is considered that in the large cities the telegraph occupies much more space than the Post Office, that in New York alone there are nearly a hundred offices, it will be seen that the rent of offices alone will be no trifling matter. How these numerous offices are to be run by employees of the Post Office is not easily seen. If they are to be closed the public will seriously suffer. The scheme of Mr. Hubbard offers a very partial and imperfect substitute for the great network of telegraph lines now in operation. He is to be required to go only to towns of 5,000 inhabitants and over, and is to be allowed five years to do it in. In 1860 there were only 313 towns with that population. How are the rest of the 4,000 telegraph offices to be served? Are they to be abandoned or left to the forbearance of private companies whose most profitable territory has been invaded by the Government?

The Committee see no such middle ground between the Government and private telegraph systems as Mr. Hubbard proposes; and if such a contract system were desirable it is not necessary to charter a new company to render the service. Old companies can do it, or new companies can be organized in the States and brought within the privileges and obligations of the law of 1866. If new inventions are desirable, private capital will much more readily embark in them now than when Prof. Morse offered his discovery to an incredulous public.

Mr. Hall's bill has for its object the introduction of iron poles and air cables—the former now in use in those European countries which have a lack of wood, the latter at present an untried experiment anywhere. He asks that these and all other materials necessary to construct his line may be imported free of duty. In a business so well established as that of the Telegraph, the introduction of new machinery may safely be left to the stimulus of competition seeking to avail itself of the latest and best instrumentalities; and whenever iron posts and air cables commend themselves to the judgment of the telegraphic managers, American mechanics will probably be found ready to make them. The obligation which would be imposed on the Government by Mr. Hall's bill to buy his lines at cost and interest, after three years, is such as Congress ought not to sanction.

## Telegraphing by the Government.

A CARD FROM MR. ORTON.

To the Editor of the Tribune:

SIR: Mr. Gardiner G. Hubbard, in his letter to the *Tribune* of this morning, in which he seeks to escape from the flying fragments of his mis-called "Postal Telegraph System," which you recently exploded, takes a parting fling at me. He calls attention to your omission to state the fact that the President of the United States Telegraph Company, during the last four months of its separate operation, is now the President of the Western Union Company. Such being the fact, permit me to ask Mr. Hubbard—what of it? Does he wish it understood that this constitutes, in his opinion, a sufficient explanation of the inability of the United States Company to succeed as a separate and competing organization, and that if he had had the management of that corporation he could have turned the losses into profits? Or does he mean that my present connection with the Western Union Company makes it impossible for him to get into the business of telegraphing except through the intervention of Congress. He accepts as correct my statement before the House Committee on Post Offices that all the telegraph companies competing with this "are losing money, and that their failure is as certain as sundown." He also indorses the *Tribune's* statement that "it is utterly impossible to place new telegraph stock on the market."

These important admissions naturally prompt the inquiry: If private companies, managed with skill and economy, are unable to realize profits from the telegraph business at the present rates, how does he expect to do so by charging half these rates? The answer is inevitable: The Government is expected to pay from the Treasury the expenses which existing companies are compelled to defray from their receipts. If, therefore, telegraphing can only be cheapened to the few by imposing additional taxes upon the many, the inquiry becomes pertinent whether it is advisable to increase those taxes beyond the actual cost of the service, so as to enable Mr. Hubbard's pet corporation to make 10 per cent. dividends.

Mr. Hubbard says his "system" is the only one which has received the approval of the Post Office Department. It is true that Postmaster General Randall affixed his official signature to a letter to Congress, which letter is presumed to have been written by Mr. Hubbard, and transmits therewith another letter over Mr. Hubbard's own signature, and that these literary Siamese Twins do indorse the Hubbard "system." It is evident, however, that the too charitable and confiding disposition of the Postmaster General was imposed upon, otherwise he could not have endorsed and made his own some of the egregious blunders of the Hubbard-Randall report. And here let me remark that since the report to Congress of the late Postmaster General Dennison in 1866, against the practicability of connecting the telegraph with the postal service, it does not appear that Congress has requested any opinion from the Post Office Department on the subject.

And it is a little singular that it did not occur to Mr. Randall that possibly some information concerning the telegraph business might be obtained from those engaged in it. It is a curious fact, however, that such sources of information were carefully avoided, and his application addressed exclusively to Mr. Hubbard, who had neither experience in, nor practical knowledge of, the business, and who is unable to comprehend the logic of its statistics.

In Mr. Hubbard's letter to Gen. Randall, transmitted by the latter to Congress, he states the number of letters passing through the post offices since the trans-

mission by rail commenced has increased in this country "from 40,000,000 to 720,000,000." It is reasonable to assume that the number of letters passing through the mails during a given period will not exceed the whole number of stamps and stamped envelopes of all denominations issued during the same period. The number of these issued for the year ending June 30, 1866, was 293,294,000. For the year ending June 30, 1867, 343,158,000, being an average of 318,000,000 per annum, instead of 720,000,000. But the actual number of letters transmitted is undoubtedly much below this average, as the consumption of stamps in payment of postage upon books, parcels, and letters of unusual weight, is very considerable.

This is a sample brick of the blunders with which the letter-report is filled.

Mr. Hubbard says his bill authorizes the Postmaster General to establish postal telegraph offices under his "system" (in addition to the places having five thousand inhabitants and over) "at such other places on the lines of the wires as the business of the country may from time to time demand." He omits to state, however, that his company is not obliged to defray any part of the expenses of the offices, except at places having the five thousand inhabitants, and that at all other places the whole expense would be defrayed by the Post Office Department; while all the telegraph receipts would accrue to Mr. Hubbard!

Under this "system" of "plenty to get and nothing to give," he is justified in the expectation of "fair dividends to the contracting company," although it is not so clear about the "small net revenue to the Post Office Department," except that it would certainly be small.

The scheme of Mr. Hubbard, stripped of its verbiage, is simply this: The telegraph service in the United States is being done as cheaply and as well as private enterprise, even under the stimulating influence of competition, can do it, and it is therefore idle for him to embark in the business as an additional competitor with any expectation of profit. If, however, he can induce the Government to give him free right of way for lines through all the States, and defray a large portion of the heavy expenses of superintending and operating them, he can make money. But, in order to conceal such purely selfish motives, it is necessary to give the scheme a veneering of plausibility and of philanthropy by promising large reductions in the charges to the public. By confining these reductions to the small volume of business which, for the sake of cheapness, is willing to be delayed, full rates may be realized from the larger portion.

Perhaps Congress can be wheedled into a partnership in such a job, but I shall not believe it until it is a fact accomplished. The avocations which men choose for a livelihood are usually selected either as a matter of taste or of necessity. The right of a citizen to stand at the door of Congress, with open palm, asking for aid to start in business, cannot be questioned, whatever may be said concerning the taste which chooses such an occupation. But I suggest whether it is decorous in the petitioner to endeavor to conceal his true character and purposes under the cloak of philanthropy, and to become the assailant of private character and interests under the assumption of a desire to redress alleged public grievances which have applied for no relief. I am, very respectfully, &c.,

WILLIAM ORTON.

Office of the Western Union Telegraph Company,  
No. 145 Broadway, New York, Feb. 16, 1869.

## Wise for Once.

All calculations based on European precedents for American development are fallacious.—*N. Y. Herald.*

## The Response to the Assessment.

Scarcely had the last number of the *JOURNAL* issued from the office of publication than responses began to come in to the call of two dollars for the families of our deceased comrades. Day by day since then, from Maine, Massachusetts, Virginia, Illinois, Ohio, New York, New Jersey, remittances have come with a promptness and enclosed in letters of so generous a spirit, that the sorrow occasioned by the dead has been forgotten in the generosity of the living. We pick up a few at random.

Geo. S. Shepard, of Addison, N. Y., writes: "I shall never hesitate to respond to your calls as long as I am able to do so."

Andrew Smith, of Andover, Mass., writes: "Enclosed find three dollars, although by the gift of the Western Union Company we are only asked for two. Perhaps you may know of some poor member whom it may enable to pay his assessment."

John A. Wright, of Trenton, N. J., writes: "I feel more encouraged than ever for our success. By death our fraternal feelings are impelled to do good. No backsliding now. Put your shoulder to the wheel is the motto for every man."

D. P. Livermore, Hallowell, Me., writes: "In case of my death, I wish the whole benefits due on my policy to be retained by the association and divided among the next five deaths."

P. Collins, of Allerton's, writes: "An organization which receives such hearty recognition from a corporation such as the Western Union Telegraph Company, should have the support of every operator in the land. I send my mite with great pleasure."

H. L. Smithers, of Gardensville, Va., writes: "Please find enclosed two dollars. I have never seen the dead, yet they were my companions in labor and were dear to me. The generous act of the Company is stimulating. I have served them sixteen years. I will do so now with greater energy than ever."

A. J. Lombard, of Washington, writes: "Just received the *JOURNAL* announcing 'Three Deaths' and the Company's generosity in the premises. I cheerfully enclose my assessment. Go on with the good work, there is nothing like it."

B. B. Joye, of Toronto, Canada, writes: "I hope these calamities, instead of causing members to withdraw, as feared by the *JOURNAL*, will be the means of adding largely to the membership, by bringing home the uncertainty of life, and the necessity of providing for those dependent upon them."

John Fuller and H. A. Tuttle, of Oswego, N. Y. write: "We hope we shall always be able to respond as cheerfully as at present, and be ready for our own final response when required."

Titus W. Bangham, of Magnolia, N. C., writes: "Were the amount four times as much, you would have it cheerfully. You will always find me ready to respond."

And so many others.

Since the "three deaths" a number of applications for membership have been received, some of which are from superintendents who promise to exert themselves to enlarge the membership.

## A Generous Woman's Example.

We cannot resist the temptation, perhaps, more properly the duty, of publishing the following note of one of the Insurance sisterhood, to show how quickly and generously the appeals of sorrow touch the womanly instincts. We shall add this good lady's dollar to the payment of the most suffering of the three families now being provided by these assessments. The sums to be paid are indeed not large; but, we are assured,

have greatly assuaged the sorrow of bereavement, and are recognized as tokens of love from the dead. They bridge over a dark hour and give hope a chance to emerge and commence again life's struggle. It is the mingled bitterness of a sudden sense of sorrow and poverty—a dark starless future, which breaks so many hearts. This dollar, given so kindly, will bear back blessing to the giver.

To J. D. REID, Esq., Treas. T. M. L. A., No. 145 Broadway:

DEAR SIR: Please find enclosed three dollars for the three deaths in Association, noticed in JOURNAL of 15th. I wish all the surviving members might willingly pay the full assessment, and the donation from the Executive Committee furnish extra relief for the bereaved ones, instead of relieving the members from any part of their obligations. Yours, respectfully,

MATTIE L. SMITH,  
No. 2 Astor House.

On our hesitation to accept the money, and proposing to add it to the payment made to the most needy of the three families, we received the following reply:

DEAR SIR: Please apply as you suggest. It is no more than right. "As the Lord has prospered you," you know—and kind Providence (or the A. & P. Co.) takes very good care of me. Moreover, I believe with Lowell in "Not what we give but what we share," so you need have no misgivings. I only wish every one could do the same as easily. Respectfully,

MATTIE L. SMITH.

—\* Have remitted three dollars.

We acknowledge the receipt of five dollars from Edward Creighton, Esq., of Omaha, for the benefit of the Telegraphers' Mutual Life Insurance Association. We would be glad if many would follow this example. It would open a new door through which to benefit the craft or enlarge its benefactions. One thing let all remember. There are no salaries, no rents, no light or fuel bills to diminish your offerings. Every dollar goes to its designed purpose.

### Progress of Telegraphing—Girdling the Earth.

On Thursday, February 4, a Celestial sailed from San Francisco for China with \$18,000 worth of goods stolen from California merchants. The victims at once sent a dispatch (describing the thief) to this city, whence it was forwarded to London via the Atlantic cable, and from there telegraphed by the Persian Gulf cable to Ceylon, in time to catch the Hong Kong steamer. When the Celestial reaches Hong Kong the officers there will have been fully a week on the lookout for him, and of course they will recover the goods and send the swindler back to San Francisco. This incident marks a wonderful progress in telegraphing during the past five years. The time cannot be far distant when offenders will be tripped by lightning in the most remote corners of the globe.—N. Y. Sun.

### Prayer by Telegraph.

CUMBERLAND, Ind., 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

I read in your November number an article headed "Religious Services by Telegraph," which ends "who approves?" I for one say amen to it, and think every Sabbath morning a short prayer was sent over the lines it would have a tendency to prevent obscene language and vulgar slang, and give the boys a higher moral feeling. It might perhaps be the means of great good, for as a class, operators have not that high refined moral tone they should have. One great trouble with operators is they have no time to spare for society, especially on railway lines. It is seldom they get to church even if inclined to do so. The consequence is that after a time they get reckless. If, therefore, we cannot go to church, let us have prayers. There will not be heart-felt sympathy at first, but let the boys know you are in earnest, they will respect prayer. Now let the one who wrote the piece in the November number come out and give his name and let us all agitate the question and see if we cannot do some good.

GEORGE JENKINS

SAVANNAH, Ga., February 15, 1869.

EDITOR JOURNAL OF THE TELEGRAPH.

We are deeply grieved at the untimely death of our brother operator and companion, Mr. Burney H. Coodge, who, at the early age of twenty years, has suddenly been taken away from us. He was a young man of fine promise, of quick perceptions and active intelligence. As an operator he had few superiors, and as a kind friend and agreeable companion he had fewer equals. Although we sadly miss his pleasant smile and cheerful voice, yet his memory will ever have a place in our hearts, and while we mourn the great loss of his presence, yet we all believe that by conforming to his high standard of morality and virtue we shall meet him hereafter in that happy home where there is no parting.

### Handy to Have in the House.

ELMIRA, N. Y., January 19, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR: Perhaps you may remember that I was an operator at Otisville for two years past, and although I have obtained a much better position now, yet I am much interested in the Science of Electricity and Telegraphing, and wish your paper for its interesting matter.

I intend to establish telegraphic communication between my house up town and my office down town, as my wife has learned to operate sufficiently to make it pleasant for us. Then if the babies should be taken sick or the house should take fire, or anything else of importance happen, immediate notice could be given, and if any one should call on us and we did not happen to have anything very nice at hand to set before them, my wife could just take the "key" and order anything needed, which necessary article I could bring along when I came home. Would not that be nice?

Very truly yours, R. L. GUYON.

HONORABLE MENTION.—W. C. Vanhorn, for a long time Superintendent of the Telegraph Department of the Chicago & Alton Railroad, has been appointed Assistant Superintendent of the south half of the Chicago, Alton & St. Louis Railroad, vice S. K. Knight, resigned. Mr. Knight has been appointed Superintendent of the Missouri Pacific Railroad. Mr. M. L. Steele, of this city, is favorably spoken of as Mr. Vanhorn's successor.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
MARCH 1, 1889.

To all Offices on W. U. Lines:

The following changes have occurred since February 15, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Harrison Square, Mass., tariff same as Brookline, Mass.  
Lockland, O., tariff same as Cincinnati, O.  
Pomeroy, O., (heretofore an "other line" office) tariff same as Gallipolis, O.  
Clintonville, Ill., tariff same as Elgin, Ill.  
Ostrander, O., tariff same as White Sulphur Springs, O.  
Mooreville, Ind., tariff same as Indianapolis, Ind.  
Spencer, Ind., tariff 10 cents more than Indianapolis from points North and East thereof, and 10 cents less from points South and West.  
Nodaway, Mo., tariff 10 cents more than St. Joseph, Mo., from points South and East thereof, and 10 cents less from points North and West.  
Athens, O., (heretofore an "other line" office) tariff from offices East of Cleveland, O., and Pittsburgh, Pa., 10 cents more than to Marietta, O., and from offices West of Cleveland and Pittsburgh 10 cents more than Chillicothe, O.  
Cunningham, Pa., tariff same as Brady's Bend, Pa.  
Offices heretofore known as "Caton offices" will use "map tariff" for Clintonville, Ill., and Nodaway, Mo.

## OFFICES CLOSED.

Columbus, Neb., Millville, Ind., White Sulphur Springs, O., and Bryan, Wyo.

## TO OFFICES HAVING "SPECIAL SECRET A."

Xenia, O., tariff same as Dayton, O.

## GENERAL INFORMATION.

Tariff to Mound City, Ill., from all offices in the Southern Division should be same as Cairo, Ill.

Tariff to Helena, Montana, from all offices East of Omaha, Neb., should be 1.00 more than San Francisco, Cal.

East Nebraska City, Mo., and Pacific, Mo., in last JOURNAL should read East Nebraska City, Io., and Pacific, Io., and the notice giving tariff to these points commencing "From Caton offices South and East," should read "From other offices South and East."

Offices which have heretofore sent and checked business for Montreal Company to New York City will hereafter send and check such business as follows:

For points in Quebec (C.E.), to Rouse's Point, N. Y.  
For points in Ontario (C. W.), to Buffalo, N. Y.  
For points in New York, to Oswego, N. Y.  
For points in New England States, to Portland, Me.  
For points in New Brunswick, to Sackville, N. B.

The tariff for points in Quebec from Rouse's Point, N. Y., will be found by adding 20 cents currency to the rate from Montreal given in JOURNAL of January 1st.

In the JOURNAL of January 1st a list of the offices of the Montreal Telegraph Company was published with rates from Western Union connecting offices.

The rates were given in gold, with the exception of those for points in the list within the United States, which were in currency. [The rates given from points within the United States to Stanstead, Buffalo and Detroit were given in gold, but should have been given in currency. The names of these offices with currency rates from Stanstead, Buffalo and Detroit are given in another column.]

At the end of the list, and also in JOURNAL of January 15th a table showing the amount in currency to be collected for the gold rates was given together with instructions in regard to checking.

The instructions for the manner of checking will remain unchanged, but the rate has been changed as follows:

Where the rate is 25 and 1 gold, collect 35 and 2 currency.

" " 40 " 2 " " 55 " 3 "

" " 50 " 2 " " 70 " 3 "

" " 60 " 3 " " 80 " 4 "

" " 75 " 3 " " 100 " 5 "

In the example given in JOURNAL of 15th January the Western Union rate, Pittsburgh to Buffalo, is 90 cents currency, and the Montreal rate, Buffalo to Acton, 25 cents gold or 40 cents currency; the check then read, if paid in Pittsburgh, 10 words 90 and 40, paid. By the above table it would read 10 words 90 and 35, paid. If the message is sent collect, it is the same as these given, 10 words 90, collect.

The other example is correct, Ogdenburg being in the United States and the rate from Oswego being in currency.

The amount to be collected on messages from the Montreal

Company will be just the amount stated in the check, as the Western Union connecting offices change the gold rates of the Montreal Company into currency.

List of offices of the Montreal Company within the United States, with rates in currency from Buffalo, N. Y., Detroit, Mich., and Stanstead, Que.

	Stanstead.	Buffalo.	Detroit.
Altona, N. Y.,	55	70	70
Ausable Forks, N. Y.,	55	80	1 00
Antwerp, N. Y.,	55	70	70
Bangor, N. Y.,	55	70	70
Belleville, N. Y.,	70	70	80
Berlin Falls, N. H.,	35	80	1 00
Bethel, Me.,	35	80	1 00
Black Brook, N. Y.,	55	80	1 00
Brushes' Mills, N. Y.,	55	70	70
Brasher Falls, N. Y.,	55	70	70
Bryant's Pond, Me.,	35	80	1 00
Burke, N. Y.,	55	70	70
Canton, N. Y.,	55	70	70
Champlain, N. Y.,	35	70	70
Chateaugay, N. Y.,	55	70	70
Clinton Mills, N. Y.,	55	70	70
Centreville, N. Y.,	35	70	70
Craig's Mills, Me.,	55	80	1 00
Crown Point, N. Y.,	55	80	1 00

## INSTRUCTIONS FOR WESTERN UNION CONNECTING OFFICES.

Buffalo, Detroit, Oswego, Montreal, Stanstead and Portland will observe the following: The Montreal Company when computing tariff on a prepaid message to a Western Union office will add to their own rate the present Western Union currency rate less one-fifth, which will then be gold. If the message is sent collect to the Montreal Company it will be checked in gold, the Western Union rate less one-fifth and the Montreal Company charged accordingly.

When the tariff after deducting one-fifth is found not to be a multiple of five the nearest multiple of that number will then be taken, as:

One-fifth off 30 leaves 24—25 will be the tariff.

"	"	35	"	28—30	"	"
"	"	40	"	32—30	"	"
"	"	55	"	44—45	"	"

When a collect message is received from the Montreal Company the gold rate for their lines should be changed to currency so that all the accounts between the Western Union offices may be kept in currency, but you will credit the Montreal Company on business from our lines to points on their lines in currency at the rates herein given, and charge them in gold for messages coming to our lines, in other words each company pays over the kind of money actually received.

Special rates from New York and Boston to Montreal remain the same.

WILLIAM ORTON, President.

## Improved Lines.

The care and labor bestowed during the past Fall on the wires leading westward from this city, the careful rearrangement of batteries by which they were reduced in size, yet really increased in workable power, was illustrated a few nights ago in a very gratifying manner.

Without stopping to state what has been done to accomplish this result, and the many inside improvements going on by which the lines are becoming increasingly effective, we give the following correspondence as a gratifying proof of their successful application:

GEN. T. T. BOKERT, Gen. Supt.:

I would respectfully call your attention to the improvement in working our "Press" and other circuits shown in working through the severe storm of last night—it having been raining during the previous day and night. "Western Press" reports started at 6.14 o'clock on No. 2 Erie wire (via Erie R. R. to Buffalo) and sent as fast as copy was filed by the agent here; actual count eleven thousand five hundred forty-four (11,544) words, transmitted to Cleveland (only one repeater in circuit—Buffalo's) or 103 sheets ordinary Associated Press manifold copy. Buffalo's note is annexed. Report closed at 3.30—raining along whole route same as at starting.

The Washington Combination (Printing) circuit worked steadily from 9 o'clock morning till 2.45 last night; Mr. Clarke, (Washington Night Chief Operator) reports sixty-one thousand (61,000) words "Press" sent after seven o'clock, evening, in addition to regular business.

Respectfully,

THOS. DOLAN, Night Mgr. N.Y. Office.

BUFFALO, Feb. 11th, 10.20 P.M., 1889.

To THOS. DOLAN:

The weather here and at Cleveland last night was rainy and very foggy. A very bad night indeed.

W. H. SLACKER, Night Chief Opr.

BUFFALO, N.Y., Feb. 11th, 10.20 P.M., 1889.

To THOS. DOLAN, N.Y.:

Out of curiosity we timed your operator, sending westward Press to Cleveland last night on No. 3 Erie. In three (3) minutes he sent one hundred and thirty (130) words. We think this good work in such weather.

W. H. SLACKER, Chief Operator.

GEO. WARREN, State Press Operator.

## The Second Cuba Cable.

We are glad to learn that the second cable to the "gem of the Antilles" has been recovered, and connection completed between Florida and Havana. This was accomplished at 5.20 P.M., Tuesday, Feb. 16th, and the cable is represented as only second in capacity to the Atlantic cable, which is probably the finest in the world. The delay in the restoration of the cable has been occasioned chiefly by the weather, quiet weather being necessary to enable the vessel to work with steadiness against the rapid current which made the work of restoration somewhat tedious and difficult. After the union was affected the steamer sailed to Key West, where the party, including General Superintendent Heiss and others, had a "good time" and a "banquet." The cable is connected with a shore subterranean line at a point between Chorrera and Havana. The first cable connected at Chorrera. Now for Demerara, St. Thomas, Trinidad and South America, as well as Spain, for which latter tenders are now invited.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MARCH 1, 1869.

### Prof. Morse's Claims.

We expected, when the proceedings of the late banquet to our distinguished countryman reached certain quarters, that some of the bitter criticisms of his claims, uttered in former years, would be revived. We have been agreeably surprised, however, by the general tone of kindness and appreciation which has characterized almost every reference thereto, and the almost universal assent to the justice and propriety of the honors conferred upon Prof. Morse, both at home and abroad. In this we confess to having entertained a most comfortable personal pride and satisfaction.

We now publish, on page 79, an article from *Engineering*, a London scientific paper of eminence, limiting, not unkindly, Mr. Morse's claims to the simple invention of the mode of recording messages on paper which was the pre-eminent feature of the apparatus first introduced by him. It is claimed, however, that the mode now almost universally adopted in America, by which messages are received by sound, is not only not his, but that Prof. Morse must be ignorant of its existence! As Mr. Morse is a frequent visitor at our central office, and takes deep interest in all its operations, this supposed ignorance is to us, of course, highly amusing and yet very absurd.

Although we had in our own possession abundant evidence of the correctness of Mr. Morse's claim to the invention of the "sounder," which is nothing more than the audible voice of the recording machinery, we preferred to send the article referred to to Mr. Morse himself, and from whom we have received the following note:

FEB. 22, 1869.

DEAR FRIEND: Some one had already sent me the articles from the London "Engineering," to which you directed my attention. I have not time, just now, to correct in full the errors, both in the original article and Mr. Sabine's friendly answer to it. If you have a copy of my pamphlet, "Modern Telegraphy," turn to pages 46, 47, and 48, and you have all the facts respecting the "sounder." I am a little surprised that Mr. Sabine should have made such a mistake, in saying that I did not know "that the Morse instruments are read by sound, because if the instruments in question do not record the signals, they are not Morse instruments, but what are known as 'American sounders.'"

The "American sounder" is the Semaphoric progeny of the Morse Telegraph; it is the telegraph without the pen; the "acoustic effect of the telegraph," without any other change; it is certainly the Morse instrument, recognized as such in my earliest patents, in which this effect by sound is distinctly specified and claimed.

Both the articles from the London "Engineering" are based upon my speech at the "banquet." In that speech I said: "In claiming for my country the paternity of the telegraph, I at the same time disclaim the origination of any semaphoric system—except as the natural concomitant or result of the telegraph." Here was the sounder, a semaphoric, which, as a result, or the natural concomitant of the telegraph, is expressly excepted in this general disclaimer. I think Mr. Sabine, on reviewing the passage I have quoted, will perceive his error. I have elsewhere incidentally treated of the propriety of the distinction I have made between the telegraph and semaphore, a subject discussed in my forthcoming report. I may say, however, in one word, that Webster in his dictionary can scarcely be cited as an authority on a word which has acquired a strictness of definition, in consequence of the progress of invention since his decease. I have no doubt my definitions will be accepted as sound as heartily as they are by my friend Mr. Sabine. In great haste, yours,

SAMUEL F. B. MORSE.

On referring to the work alluded to in the above note,

we find a defense of Mr. Morse's claim to the invention of the sounder, elicited by the statement of a well-known American author, that "Reading by sound, so far as the Morse telegraph is concerned, was purely an after-thought, taken up by the operators of their own accord." Still further emphasizing this statement, the same author says: "The credit of introducing as well as the discovery, as far as telegraphy goes, is due entirely to the American operators. It was discovered by them, and adopted by them."

In reference to these statements, Mr. Morse says: "This account of the origin of the sounder is published in the work referred to in 1860, more than twenty years after these very sounds had been specified and claimed in my letters patent as a part of my invention, and twelve years after the claim had been adjudged to be valid by the decision of a Circuit Court, and six years after this decision had been affirmed, on appeal, by the Supreme Court."

"What is this sounder?"

"The idea of making and preserving an automatic record of dispatches transmitted by electricity, and particularly the device of alphabetical characters, or a code of signs, adopted to such record, when brought to public notice was not at once perceived to be of unusual importance."

"It was soon, however, perceived that the telegraph code of signals which I had designed, was not merely the reduction of the alphabet to the simplest visible elements, to wit, *broken parts of a line*, but it was also perceived that these sounds could readily be recognized by any and each of the senses, and therefore that they passed an element of universality which commended them for other uses. They are not limited to telegraphic recording. Unlike any other code, each letter, as well as numeral, in the act of writing it has its own peculiar sound."

"The peculiarity of my telegraphic code was early noticed in the operation of the first instrument of 1835. Prof. Gale, in his examination before the courts, thus alludes to his acquaintance with the fact of reading by sound as early as the spring of 1837. He says, in the case of French vs. Rogers, p. 434:

"The fact that the said Morse's Register indicates the message sent, both by sounds and permanent marking, was early noticed by all familiar with the invention, and was the subject of conversation and experiment between the said Morse and myself in the spring of 1837. So much knowledge was, in fact, conveyed by the sounds of the instruments, by those familiar with it, that not only messages could be read by the sounds of the instrument, but the peculiarity of the person working the instrument at a distant station could readily be recognized from his manner of touching the key."

"The language of my first patent, applied for in 1838, has, therefore, these words:

"I especially claim as my invention, the use of the motive power of magnetism, as means of operating machinery which may be used to imprint signals upon paper or other suitable material, or to produce sounds in any desired manner for the purpose of telegraphic operation at any distances."

We have quoted sufficient from the work referred to, we think, to settle forever this question of the origin of sounders and who was their inventor. The truth is, that the reception of the Morse code upon the ordinary Morse register, consisting of a series of strokes of varying length and combination upon machinery arranged to indent paper, was so adapted to and so easy of reception by the ear, that the telegraph office had not been opened a month in Philadelphia before a sharp-witted broker learned by the sound of the instruments the contents of despatches while standing outside the office enclosure. It is not wonderful, therefore, that thousands have learned it, and that some of the earliest to use it really imagined that the discovery was their own. If any credit be given to other than the inventor, for the quick perception of how these simple signals of the Morse code could be learned and used, we think the credit is due to that same Philadelphia broker, well known as "Bull Bridges," who not only could interpret the sound of the register while standing apparently unconcerned outside of the office railing, but could, with his eyelids, transmit the same information by the same code to a confederate near by, to the infinite disgust of the regular Board, whom he for a long time worried by his dexterity, and beat by his skill.

We join with Mr. Morse in believing that, with the knowledge of the facts thus given, not only will Mr. Sabine do full justice to him, but that the American author will, in a future edition of his otherwise valuable work, gladly correct the errors into which he has been led, and which evidently have been the means of like errors on the part of others.

### Receiving by Tongue.

A good deal has been said about the exploit of receiving messages by tongue, and no doubt when first done, it was a curious and very smart operation. We do not know who first executed this lingual feat, but we give a record of one under our own superintendence, which may reveal the total depravity of the editor of this paper, but may yet amuse. Mr. Morse has certainly no claim to the experiment, although we do not know how even this could have been done without the Morse code.

The record of this experiment we wrote down as follows, and published in the *Telegraph Review* in 1853. The "Zook" referred to was General Samuel K. Zook, who fell bravely at the battle of Gettysburg, one of the best men who ever put on telegraphic harness.

Speaking of breaks, which occurred often, we wrote as follows:

"We shall never forget one of these breaks. We were then in Philadelphia, S. K. Zook and we the only force. Poor Zook! thy memory comes back to us with a sad recollection of the time when we agreed with thee to go out and 'hunt the break.' Large Grove Batteries were then (1846) in use, 60, 70, 80 cups. Well, Samuel went on his errand, carrying his climbers, soldering pot, file, an old pair of unmentionables, and a two dollar bill to pay expenses. It was agreed to test at Norristown, fourteen miles off. The testing was ordered to be done thus:

"Samuel, you will select a wet spot; into this stick a piece of wire four or five feet long; brighten the end with a file; then take down the wire of the line previously broken, and by manipulating the two ends in the same manner as the office key, I will get what you say."

"But how will I get your answer?" queried Sam.

"Listen, thusly," he replied. "When you have finished your message to me, which make of such a character that yes or no will be the answer, put the line wire on your tongue, and if yes I will say 'aye, aye'; if no, I will open the key."

So away went Sam, found a convenient puddle, and stood in the mud. He had brown kids on his hands. A curious crowd was round him. He looked very silly, no doubt, in that mud puddle, tapping two little wires together. But Sam was both a soldier and a philosopher. He was on duty and a crowd did not trouble him. He sent his message, it was thus:

"If the line is all right now say, aye, aye. S. K. Z."

Now, be it remembered, the battery was large, and fresh, and strong. Eighty cups were brewing their sour broth up in the garret of the Merchants' Exchange, ready to blaze away on their mission to Gotham. Sam brightened his wire and put it on his tongue. He had planted his feet well in the mud; a wicked thought came o'er us. Down went the key with the most determined mischief. 'Twas done, well done, and done quickly. Poor Sam lay flat in the mud! A solemn silence reigned on the wire for the space of five minutes. But Samuel came to. Oh! how he swore! the long-drawn swear came slowly and solemnly over the wire until our own hair stood on end. We had never seen the telegraph in wrath before, and it rather took us down. It was a prodigious swear, terse and terrible.

In a few hours after Samuel K. Zook walked into the office with his soldering pot and things, covered with Norristown mud from his boots to his hair, and his tongue badly blistered. An ill-timed laugh made him think we had done all this on purpose, and he looked a very badly-abused man, although he often laughed over it afterwards. He never risked himself in such a work again. But we believe Sam was the very first man who received a message on his tongue. Poor fellow, he rests now among the slain at Gettysburg.

In reply to many inquiries respecting "Pope's Modern Telegraph," we think we may assure all that it will be ready during the present month and be duly advertised.

## Faraday.

"Nature, not education, rendered Faraday strong and refined. A favorite experiment of his own was representative of himself. He loved to show that water in crystalizing excluded all foreign ingredients, however intimately they might be mixed with it. Out of acids, alkalies, or saline solutions, the crystal came sweet and pure. By some such natural process in the formation of this man, beauty and nobleness coalesced, to the exclusion of everything vulgar and low. He did not learn his gentleness in the world, for he withdrew himself from its culture; and still England contained no truer gentleman than he. Not half his greatness was incorporate in his science, for science could not reveal the bravery and delicacy of his heart.

"We have heard much of Faraday's gentleness and sweetness and tenderness. It is all true, but it is very incomplete. You cannot resolve a powerful nature into these elements, and Faraday's character would have been less admirable than it was had it not embraced forces and tendencies to which the silky adjectives 'gentle' and 'tender' would by no means apply. Underneath his sweetness and gentleness was the heat of a volcano. He was a man of excitable and fiery nature; but through high self-discipline he had converted the fire into a central glow and motive power of life, instead of permitting it to waste itself in useless passion."

## Writing in Cyphers and in Short-Hand.

These abbreviated modes of writing are not of modern invention. The ancients had ingenious cyphers for their secret dispatches, and sent private orders to their commanders or ambassadors, which could not be opened, so as to be legible, without a peculiar contrivance or the key. Cæsar's usual method was to write by agreement the fourth letter of the alphabet for the first; for example D for A, and so on, varying the arrangement occasionally. The Romans had also short-hand writers, a chosen number of whom were employed by Cicero to take down a speech of Cato. Martial and Ausonius bear testimony to the surprising skill of some of them.

## Fruits of a Low Tariff.

It is not a matter of speculation if the result of the proposed low rates of governmental telegraphing will result in the bankruptcy of the bureau which has it in charge. The experience of Belgium—upon which Mr. Washburne, with amazing ignorance, or more amazing inability to reason, principally relies for support of his folly—should be solemnly sufficient for us. When Belgium, in order to enlarge the use of its telegraph by making it popular, reduced her tariff on telegrams to one franc a message, she lost 41,417 francs, notwithstanding all the advantages the lines possessed of free rents, free railroad transportation, freedom from taxes, and the cheapest of labor. When subsequently, acting on a theory strangely Washburnian, that a yet lower tariff would develop the public use of the lines and make them self-sustaining, Belgium, in 1866, reduced her tariff one-half, the expenditures were increased from 653,280 francs (in 1863) to 1,217,496 francs—involving a loss to the government of 255,282,000 francs!

## Married.

In Lockport, N. Y., February 1, by Rev. L. S. Stevens, Mr. Jas. W. Tillinghast, of Buffalo, to Mrs. Anna E. Kelley, of Lockport.

## Died.

In Halifax, N. S., on Tuesday morning, February 2d, Eliza Rebecca, the beloved daughter of Wm. H. and Agnes S. Wiswell, aged two years, one and one-half months.

Mr. Wiswell is cashier of the Western Union Telegraph Co., at Halifax, with whom and his companion we deeply sympathize in this sad bereavement.

At Savannah, Ga., February 13, 1869, of quick consumption, Mr. Burney H. Coolidge, an operator of the Western Union Company's Savannah office, aged twenty years and three months.

## Semaphore and Telegraph.

(From Engineering.)

Professor Morse, who claims for himself the invention of the electro-magnetic telegraph, was recently entertained at a complimentary banquet in New York, at which Her Majesty's minister to America, Mr. Thornton, C.B., was present. Professor Morse, in the course of a speech, made a distinction between the words semaphore and telegraph. His national lexicographer, Webster, makes no such distinction, and says furthermore, adopting the distinction of the Encyclopædia, that a telegraph is a "machine for communicating intelligence from a distance by various signals or movements previously agreed on," and further, that "this machine was invented by the French about the year 1793 or 1794, and is now adopted by other nations."

In his speech, the Professor said that he "claimed for the United States the position of having given to the world the modern telegraph." The instrumentalities for the purpose of intercommunication at a distance, which have been used from time immemorial, are naturally divided into semaphoric and telegraphic, the former conveying a signal evanescent in its nature; the latter permanently recording a sign. The English system, elaborated in 1836 and established in 1867, through the energy and skill of the ingenious Mr. Cooke, subsequently aided by Mr. Wheatstone, was a *semaphore*. In 1832, on an American ship, the Sully, on her voyage from Havre to New York, the first telegraph was conceived, and its essential peculiarities brought forth and elaborated. In 1835 it lisped its first accents (?) and automatically recorded them in New York city. In the winter of 1837-8 it was presented before Congress. Whether the telegraph had or had not in its composition anything in common with the so-called telegraphs in Europe, but which were simply electro-magnetic *semaphores* and not electro magnetic *telegraphs*, it is evident from the dates that the American telegraph could scarcely have derived anything from them, since they did not practically exist till some years subsequent to the conception and planning of the telegraph on board the ship, nor did the first English electro-magnetic semaphore exist until after the first practical operation of the American electro-magnetic telegraph in New York city.

When does Professor Morse suppose was the first electro-magnetic "semaphore" conceived and planned? Quite as early, certainly, as 1832, if that is of any consequence. And does not the Professor know that most of the Morse instruments in the States, so far from recording any signals, are read by sound alone? The *printing* telegraph, we need scarcely add, is not his at all.

(Criticism by Robert Sabine, Esq., Engineer.)

To the Editor of Engineering:

I read, with much gratification, in your last impression, a notice that Professor Morse had been entertained at a complimentary banquet, given recently in New York. In your short comment upon the after-dinner speech of the veteran telegraphist, you have, I think, done him barely sufficient justice, and therefore it is that I take the liberty of intruding this letter upon your notice and upon your space.

Professor Morse tells us that in 1832 he first imagined his electro-magnetic recording telegraph. Before that date all systems, which had been proposed, were arranged for the reception of visual signals. For instance, in Soemmering's, in 1808, the indications were given by the escape of gas; in Ampere's in 1850, by deflections of magnet needles, and in the same way a host of other plans, amongst the best of which was, perhaps, that of Schilling, in 1832, doomed subsequently to become, in a somewhat modified form, the single and double needle system of our talented English constructors—Messrs. Cooke and Wheatstone.

You ask, "when does Professor Morse suppose was the first magnetic-electric (electro-magnetic?) semaphore conceived and planned?" It is not the electric-magnetic semaphore that Professor Morse claims the invention of, and which was certainly in being as early as 1820, but the electro-magnetic telegraph.

The advance made by him was in rendering a receiving apparatus self-registering; in other words, in the invention of a recording instrument.

Others did this too, but later. Steinheil, developing Gauss and Weber's designs, produced also a recording in-

strument, the details of which were very beautifully thought out, and many other perfect systems of recording telegraphs—chemical and printing—have since then been brought forward. But the fact cannot, I think, be disputed that Professor Morse was the first inventor of Recorders.

This, if I understand rightly, is all the distinction claimed by him in his after-dinner speech which gave occasion to the comments in your valuable journal.

Perhaps the course pursued by him in so doing was calculated to mislead as to the real extent of his assumption of priority. He says that he was the first inventor of electric "telegraphs" because those which existed before his were not electric "telegraphs" at all, but electric "semaphores."

If the word "telegraph" means a system of *writing* at a distance, Professor Morse is perfectly right; for, in the earlier systems, no writing was done, at least by the instrument. Therefore, the word "telegraph" would be, strictly speaking, misapplied when referring to needle and acoustic instruments. But this word is now so generally defined to signify any system of a speedy transmission and reception of intelligible signals, that, right or wrong, it is certainly too late to disendow it of a definition which custom has established, and give it another which would involve the immediate coining of a new word for indicating most of the systems hitherto called, or, it may be, miscalled, "telegraphic."

It may seem like a disposition to "split hairs" on the part of Professor Morse, to indulge himself in the conceit of quarreling about the etymology of a word, when its acceptance, perhaps, with every spoken language on the face of the globe would render the task of amending it a hopeless one, and particularly so in ours, in which the recognition and use of slang, in some form or other, by everybody, is rendering us gradually indifferent to finer distinctions, drawn from the derivations of the words we employ.

Yet his reasoning is sound, and I perfectly agree with him in the distinction which he draws between electric "semaphores" and electric "telegraphs."

The title of "inventor of the electric telegraph," however, which the adoption of the amendment would undoubtedly, of right, entitle Professor Morse to, is one which cannot, in a broader sense, be given to him. The acknowledged inventor of the first telegraphic *recording* instrument must, therefore, be content to remain an honored and distinguished member amongst the workers in the common field, for history will not assign him any other place, whatever we lexicographers may decide as the form of definitions.

You ask, "does not the Professor know that most of the Morse instruments in the States, so far from recording any signals, are read by sound alone?" Most undoubtedly the Professor does *not* know this, because if the instruments in question do not record the signals, they are not Morse instruments, but what are known as "American sounders."

You are perfectly correct in saying that the printing telegraph "is not his at all." I am quite sure that Professor Morse would never think of claiming it—first, because it is of too recent a date to touch the question at issue; and secondly, because he has never displayed any desire to crown himself with his neighbor's laurels.

Your obt' serv't, ROBERT SABINE.

London, January 18, 1869.

## Nova Scotia Electric Telegraph Company.

At a meeting of the Directors of the Nova Scotia Electric Telegraph Company held at Halifax, 29th January, 1869, the following officers were elected for the current year:

President—E. D. Meynell, Esq.

Executive Committee—Hon. Senator Dickey, C. H. M. Black, Esq., W. M. Harrington, Esq., Jesse Hoyt, Esq.

Secretary and Treasurer—William Twining, Esq.

On receipt of five dollars for five new subscribers, or in payment of five subscriptions now due for Vol. 2, we will send a copy of "Pope's Modern Practice," or we will credit one dollar to the Telegraphers' Insurance Association.

# Journal of the Telegraph.

## New Telegraph Enterprise.

RICHMOND, Feb. 25, 1869.

In the Circuit Court to-day, a charter was granted to Joseph Finnegan, and other citizens of Georgia and Florida, to build telegraph lines through and in Virginia, the capital stock not to exceed \$1,500,000.

THE subject of a telegraph line from the Atlantic to the Pacific Ocean, was yesterday (Feb. 25th) brought up in the British Parliament. It was thought advisable, according to one of the members, not to make any statement as to the prospect of building the line, until the negotiations now pending for a settlement between the Hudson Bay Company and the Dominion of Canada were satisfactorily closed.

## Prospects of a Telegraph through the Hudson Bay Company's Territories.

LONDON, Feb. 25, 1869.

In reply to a question Mr. Monell said the negotiations for a settlement between the Hudson Bay Company and the Dominion of Canada were still pending, and it was undesirable to make any statement as to the prospect of building a telegraph line through the territories of the company to connect the Atlantic with the Pacific coast until a complete adjustment was reached.

On the authority of the correspondents of the New York *Evening Post* and New York *Tribune* we stated, in our last issue, that the Senate would probably report favorably some of the items of Mr. Hubbard's plan for Postal Telegraph service. In this, we are informed, we were at least premature, as no such design is yet known.

A SPANISH TRANS-ATLANTIC CABLE.—The Spanish Consul General has announced that tenders for a submarine cable between the islands of Cuba, or Porto Rico, Canaries, and the coast of Spain in the port of Cadiz, or its neighborhood, will be received at the Consul Office (Ministerio de Ultramar), Madrid, prior to the 1st of March next.

Mr. Frank S. Van Valkenberg, who arrived from New York a short time since, has been installed as chief operator in the Western Union Telegraph Company's office at Sacramento, he having been sent out here to assume that position at his own request. He is an experienced telegrapher, and served with distinction in some of the most arduous campaigns of the war. He was chief telegrapher in Sherman's army prior to the famous march to the sea. Few men are in possession of more interesting reminiscences of the war than Mr. Van Valkenberg. He has been the custodian, by reason of his position as an operator, of State secrets of the utmost importance. His adventures with "stock sharps" were sometimes rich and curious. Shortly after the war he was approached by a set of stock gamblers, who proposed to make use of him for the furtherance of a "rascally scheme for their own emolument. This, in brief, was to go to Salt Lake, and telegraph thence to New York the loss of the China steamship, and the death of Allan McLane; the line to be then broken at some lonely place east of Salt Lake, and in the meantime to buy up Pacific Mail Steamship Company's stock, which the above bogus news would cause to be thrown into the market at depreciated prices. The wires being restored after much delay, the news would be contradicted, and the stock would react, and a handsome fortune be realized. Mr.

Van Valkenberg promptly laid this villainous plan before the Directors of the Mail Company, who, deeming it advisable to detect these operators, sent the shrewd telegrapher to Salt Lake, whence he informed his principals of the schemes of the sharpers, and in their very presence, but in the language of telegraphy, which they could not comprehend. At the proper time they were arrested and convicted.

Often, during the war, he has stood at the end of telegraphic lines at the seat of war, and conversed with Mr. Lincoln and Secretary Stanton at Washington. He was with Thomas at Nashville, and telegraphed to the President the successive events of that battle, and the rout of Hood's army.—*San Francisco Times*, Jan. 2.

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL O. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDICT BROTHERS,

NO. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH

Watches Repaired in the most thorough manner, and Warranted.

## SPECIAL NOTICE

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDICT BROTHERS,

Agents for the American Waltham Watch,  
691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 3, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

## SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

## THE BUNNELL REPEATER.

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

## THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

## MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

## THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Rathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH OF Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,  
Office and Factory 86 Nassau Street,  
New York City.

SIR Charles Bright returns to England March 3d, on the Cunard Steamship Samaria. We congratulate him on his successful restoration of the Cuban cable, which was picked up in 700 fathoms of water and against a three mile current.

CHESTER, PARTRICK & CO.,

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

88 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

INSULATED POLE LINE CORDAGE

AND

OUTSIDE OFFICE CONNECTING WIRES.

We have completed some valuable Experiments, and have now the pleasure to offer to Telegraph Companies, and others interested,

THE BEST

AIR LINE

AND

OUTSIDE OFFICE INSULATED WIRES

that can be had.

Parties using are invited to examine them at our Office.

SAMUEL C. BISHOP,

May 30, 1888.

General Agent.

STICKWELL & CO'S  
EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

*Stickwell's Mucilage is KING of the Market. No other brand sells as well.*

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 80Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-800th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00

## Schnitzerl's Philosopher.

Herr Schnitzerl make a philosopher  
Von of de newest kind ;  
It vent mitout a veel in front,  
And hadn't none behind,  
Von wheel was in de mittel, dough,  
And it vent as sure as ecks,  
For he shtraddled on de axel dree  
Mit der wheel between his lecks.  
Und ven he vent to shtrart id off  
He paddlet mit his veet,  
Und soon he cot to go so vast  
Dat avery dings he pest.  
He run her out on Broader shstreet,  
He shkeeted like de vind,  
Hei! how he bassed de vancy craps,  
And lef dem all pehind!

De vellers mit de trotting nags  
Pooled oop to see him bass ;  
De Deutschers all erstaunished saidt ;  
"Potztausend! Was ist das?"  
Boot vaster shstill der Schnitzerl flewed  
On—mit a gasthly smile.  
He tidn't tooch de dirt, py shings!  
Not vonce in half a mile.

Oh, vot ish all dis eartly pliss?  
Oh, vot ish man's soockses?  
Oh, vot ish various kinds of dings?  
Und vot ish habbiness?  
Ve find a pank note in de shtreedt,  
Next dings der pank ish preak :  
Ve folla, und knocks our outades in,  
Ven ve a ten shtrike make.

So vas it mit der Schnitzerlein  
On his philosopher ;  
His feet both shlipiped outsideward shoost  
Vhen at his extra shpede,  
He felled oopon der wheel of coorse ;  
De wheel like blitzen flew ;  
Und Schnitzerl he vos schnits in vact  
For id shlished him grod in two.

Und as for his philosopher,  
Id cot so shkared, men say,  
It pounded onward till it vent  
Ganz teufelwards afay.  
Boot where ish now der Schnitzerl's soul?  
Where does his shpirit pide?  
In Himmel troo de endless plus,  
It takes a medeor ride.

CHAR. G. LELAND.

## The Velocipede—The Telegraph.

While our papers are full of "velocipede notes," extolling and illustrating the new locomotive, we propose to have our "note" also. In a business where the highest speed is the highest object, every thing which has to do with motion, celerity of progress, dispatch, ubiquity, is of interest to us. We have not yet arrived at the point where the flash of the electric spark has its counterpart either in the operations of receiving or delivering dispatches. A slow porter or an indifferent boy is intrusted to take a message to an office, and both have to do an amount of window gazing or acrobacy on their way, which consumes as much time as might have transmitted a treaty of peace from Washington to London. And even in the hands of the telegraph company, a dispatch for delivery two

a boy's fidelity and a boy's love of fun and dog fights, or the irregular promptitude of city wires, before it reaches its destination.

We do not say a word against the boys, for with them we have ever had a deep and friendly interest ; nor against city lines, for they are under the best executive management. The messengers of a company perform a most important part of the telegraphic service. Their service demands a high degree of fidelity, sagacity, determination, besides the mere swiftness of foot necessary to perform their duty acceptably. But there is more practical skill and more persistent watchfulness needed to reduce the time

THE TELEGRAPH MESSENGER.

CITY DELIVERY LIGHTNING LINE.

which is even now expended between the reception of a message by the wire and its delivery into the hands of the party addressed, than in all the other parts of its progress. Anything which will reduce the time thus consumed, which will prevent the consumption of an hour or more to deliver a dispatch two miles from a central office which came a thousand miles over the wires in two minutes, must be hailed as an acquisition, and, if possible, made available.

But don't your city wires accomplish all that is desirable in that direction? With fifty auxilliary offices in a city like New York, why should delivery be slow? Alas! the use—the prompt use—of city wires is a matter of uncertainty, and of frequent necessary delay and irritation. City wires cannot be arranged in distinct

direct wires are erected for many special points. To our principal hotels messages are sent prompt enough. But when a message has to be delivered to a private house distant from the central office, it has to be sent to some one of the offices where boys are allowed, and where their number is of necessity limited, sometimes arriving there when all of them are out on distant errands, to await its turn. In this case the same operation of transmission, filing, entry, which was necessary in its first journey, with the risks of repetition through hands often less experienced, has to be undergone. These necessarily involve time, care, risk, delay. Yet we believe this service is, on the whole, done with creditable accuracy and promptitude. The only hindrances are those inseparable to such arrangements, and in the use of means which require the highest style of fidelity, but which, even in the most efficient hands, sometimes baffle the most earnest endeavors.

Has this new vehicle any mission to perform in relieving this difficulty? It has all the elements of excitement which would suit and captivate a spirited boy—a boy of pluck and metal. There would be no windows for him to gaze at—the gaze would be at him. He would glory in showing to admiring crowds how he could spin along on his mission, blowing his whistle at the crossings, and would claim "good time" on his return. We think we see one now, with a suitable dress on, a jockey cap on his head, a leather wallet strapped on his back, with his boots shooting out in gay spanking style, his eye sparkling with excitement, making ten miles an hour up Broadway or down the Bowery, or along Wabash avenue in Chicago, or Chestnut street, Philadelphia, hi-hi-ing to the lazy omnibuses that impeded his way! Don't you think that boy is happy? Even if he does now and then upset an elderly gentleman, or pitch through the bowels of an apple stand, or cut a dog in two, these are only green spots in his memory when he recounts the days' experience, and he enjoys his grub with a more glorious relish as he remembers how the apples scattered, or the divided dog's eyes bade goodbye to the astonished and departed tail! Don't

he though? "You bet."

Well, "we shall see what we shall see" by-and-by. We would like to see the experiment tried. Ponies were once tried in St. Louis, with what success we do not know. We want to see a good boy straddled across a velocipede and put on his honor and metal. We think there would be some quick time made. Trot him out and try him.

A PARISIAN has invented an electric cane, which is intended as a defense against highwaymen and burglars. It consists of a horn inserted in the end of a cane, which horn contains an electric battery and a lamp with two powerful reflectors. The intensity of this light temporarily blinds any person at whom it is pointed. The lamp is kindled at will by pressing a small knob at the other end of the cane, which knob

### Proposed Government Telegraph System.

[Although it is certain that for the present, at least, all the schemes proposed to Government to incorporate the telegraph into its machinery will be rejected, yet we cannot err in placing on record the thoughtful and careful opinions expressed by the press in relation to these attempts to wrest from the people the control of their proper enterprises. We, therefore, consider no apology necessary in publishing the following clear and pungent article from the *Financial Chronicle*, to which we ask the attentive perusal of our readers. It was crowded out of our former issues.—Ed.]

[From the *Financial Chronicle*, January 16.]

There appears to be a determined effort in Congress to place the telegraph system of the country under Government control. Last year, Mr. Washburne took the initiative by introducing into the House a bill providing for the building of a Government line from Washington to New York, to be worked in connection with the post office, the enterprise being designed as an experimental step toward the ultimate monopoly of the whole business of telegraphy by the Government. Some doubts of the ability of such a line to compete with private companies appear to have been entertained, and that scheme may, perhaps, be considered as having little chance of adoption. The Postmaster General, however, profiting by the experience of his predecessors in the movement, now comes forward with a scheme for blending a telegraph service with the post office, not through the Government building or purchasing lines, but by the organization of a company which shall contract with the Government to transmit messages at fixed low rates. He proposes that the company be authorized to construct lines on the post roads and routes; that its capital be fixed at \$200 for each mile of wire; and that its wires be multiplied or extended at the will of the Postmaster General. Offices are to be established in connection with the post offices in every city and village of 5,000 inhabitants and over, at railroad stations, and at such other places on the line of the wires as the business of the country may require. The maximum rate to be charged by the company for the transmission of messages is fixed at 20 cents for twenty words, for each 500 miles or part thereof, to which is to be added five cents for postage and delivery. Provision is also made for the prompt delivery of messages and for the remittance of money by telegraph, as now through the money order office. This scheme has been suggested to the Postmaster General by parties at Boston, and apparently in connection with an offer to organize a company upon the terms suggested. It is not proposed, however, to contract with the new company if any other should offer to do the business upon better terms.

There is a certain seductiveness about Mr. Randall's scheme which is quite likely to secure its favorable consideration. He very adroitly evades some of the more prominent objections against the Government meddling with public enterprises. His scheme, it may appear, involves no outlay in lines, and little risk by the Government, both being thrown upon the company with which the Postmaster General may contract; nor does it grant exclusive privileges to either the Government or the company, while it proposes to furnish telegraphic facilities at very much cheaper rates than are now charged by private companies.

Much reliance appears to be placed upon the assumption that a large economy in the management of the business would be effected, as compared with that of the existing companies. Is it safe to take this very important item in the calculation for granted? There is, perhaps, no branch of corporate business conducted with greater economy than telegraphing, so far as respects appearances and accommodation. Compared with our banks, insurance offices and railroad depots,

the telegraph offices are unpretending and crowded, an immense business being frequently done in basements or in secluded corners rented in private stores or offices. We do not believe it will be pretended in any quarter that there is extravagance, or more, that there is not the strictest economy, in the management; which, of course, necessitates a corresponding conservatism in the control of competing companies.

Now it is most important that the Postmaster General should have shown wherein the economy in the post office management of this business would exceed that of the present companies; but on this very essential point we have not a word of explanation. So far as respects offices, it may be assumed that, in the smaller towns and villages, the existing post office buildings would in many cases afford scope for the added telegraph business. But this is far from being true of the larger cities, where the bulk of telegraphing is done. The mail business has, in most instances, outgrown the old buildings in which it is transacted, and mailing operations suffer from lack of adequate accommodation; a fact to which the Postmaster General's annual reports bear ample testimony. Does Mr. Randall suppose that the crowded quarters in Nassau street, or the new office to be some day erected elsewhere, will afford accommodation equal to that given by the present 74 telegraph offices, in this city, with their 375 employees? With 35 offices in Philadelphia and 211 employees; 24 in Boston and 156 employees; 22 in Chicago and 86 employees; 21 in Cincinnati and 93 employees; and with other cities in like proportion, the Government would evidently find it necessary to lay out large sums in extending its post offices and building new ones and furnishing them, which would no doubt be profitable to politicians, but would be poor economy to the public funds. In addition, therefore, to the capital to be laid out by the proposed company, in new wires, the public would be taxed to provide capital for the requisite accommodations in the Postal Department. This certainly is not the sort of response the public expect to their earnest demand for public economy.

Nor is it any clearer how any economy is to be effected with respect to employees. If the Post Office Department is properly managed, the hands in the offices of all towns or cities of 5,000 inhabitants and over (to which it is proposed to extend the system) are already fully employed; none of the employees of the post offices, excepting the carriers, would be available for the new business, and a wholly additional staff would, therefore, have to be employed. Nor would there be any economy to the public in the carriers being available for the delivery of messages, inasmuch as it is proposed to charge five cents each message for delivery, which is probably more than the present cost of delivery to the private companies. The effect of the proposed arrangement, therefore, would be to increase largely the capital and labor employed in telegraphy, without correspondingly augmenting the business done. This certainly is not economy. We can easily understand how the proposed company should undertake to send dispatches at much lower rates than are charged by private companies, when the Government undertakes to provide buildings, furniture and stationery, and to meet expenses of repair, lighting, &c.; but it would be a great mistake to suppose that, under such an arrangement, the public had paid in full for their messages when they had bought the stamped paper on which they were written; a large balance would remain to be paid in taxation to defray the expenses of the new department. It is singular that Mr. Randall, in urging the argument of economy, should have failed to show what would be the probable outlay and the annual cost to the Government of his scheme. We presume there are good reasons for his reticence.

But even after this large outlay on the part of the

Government, it does not by any means follow, because there are parties now ready to organize a company and to make a contract, as the Postmaster General proposes, that they would long continue to send telegrams at the reduced rates offered in this scheme. Suppose that the contractors, after a convenient period should announce their inability to do the business at the rates agreed upon, what would the Government do? No other company would be likely to take up the contract, for the failure of the new organization would deter them. The Government would therefore have the choice of taking the whole affair into their hands or of submitting to a higher tariff. The latter course would be an acknowledgment of the failure of the scheme; and the former would be, in every sense, an unmitigated evil, an abuse of the functions of Government, a substitution of political management for business enterprise and an extension of the political corruption connected with bureaucracy. The company which Mr. Randall proposes to associate with the post office would thus virtually hold the Government at its mercy; and having the same motives to exact the highest possible rates as influence other companies, we have no sort of assurance that the corporation would not, after having used the Government to bring it into existence and give it prestige, yield to inducements from private companies and demand an advance upon the proposed schedule. This view will commend itself, we think, forcibly to all acquainted with the management of corporate interests.

In addition to these objections to Mr. Randall's scheme specifically, there are others against any and every form of Government interference with the business of telegraphing. It is essential to the protection of the public that the parties who do its telegraphing should be responsible for delays, errors, neglect or the divulgence of secrets. Without such a stimulus, the best managed companies would be apt to transact their business carelessly and the public would suffer inconvenience and loss. The Government would be exempt from all such liabilities; and in the absence of this motive to care and energy its business would be less efficiently transacted than that of private corporations. The history of telegraphing proves that its progress depends entirely upon scientific research and experiment, and the promptness of competing companies to avail themselves of each successive improvement in processes and instruments. State bureaus are notoriously slow to recognize the results of invention. Officials too frequently refuse to move in the adoption of improvements until won over by a *douceur*; and provided such an inducement be offered, they are apt to recommend or adopt inventions irrespective of their merits, always ready to make the interests of their department subordinate to perquisites. The Government is in no position to command the services of the most efficient agents. Of necessity, it pays a fixed salary to its officers, which is less than really talented experts can command at the hands of corporations; and it is thus of necessity distanced in enterprise by private parties. Any governmental system of telegraph would pay less regard to public convenience than is afforded by the existing companies. The present companies carry their wires into the hotels, railway and other corporation offices, and in this city to the stock boards, gold room, produce exchange, and every place where an important amount of telegraphing is transacted, thereby effecting a most material economy of time and expense in the conveying of messages. The Government scheme proposes to do nothing of the kind; and from this very neglect Mr. Randall's telegraph would fail to draw from the existing companies the most material part of their business. These are but a few of the many weighty objections that might be urged against the Government attempting this form of interference with private enterprise.

## LONGITUDE OF THE PACIFIC COAST.

### The Telegraph Lines Brought into Requisition to Settle the Point.

#### INTERESTING EXPERIMENTS.

[From the Chicago Tribune.]

Some of the simplest and most practical details of common life go hand-in-hand with the most abstruse scientific facts. The farmer who sneers at "book learning" is indebted to the savor for the plainest and most effective helpers to his labor, though not always ready to acknowledge his debt. Jack Tar, on the contrary, is always willing to give science her due, for he knows his dependence upon the patiently wrought results of the astronomer and the mathematician. No safe navigation in the open sea without the chart, and no value to the chart unless entire accuracy pertains to its details. A rock or a shoal encountered several leagues out of reckoning are severe reminders of the vital necessity of skill in chart makers. The work of the coast survey began many years ago to engage the attention of maritime nations, and the work of determining longitudes has moved slowly toward perfection through slow gradations. The efforts were early directed to the improvement of time-keepers. Obviously, if strictly accurate chronometers were in the hands of parties ever so far distant, and both making the transit of the same heavenly body upon any established meridian, the merest tyro in this branch of science can discover the ease of reaching the result, for the exact difference in time between the two reduced to degrees would give the longitude with equal exactness. But "to err is human," and watches are of human workmanship, and infinitesimal measures of time are of importance when the fraction of a second on the watch-face becomes a variation of degrees on the dial of the universe.

The overland telegraph has opened the way to a more careful determination of longitudes on the Pacific coast than any care in the construction of chronometers could bring, because it gives the actual alliance of clock-beats through the wire. Several times within the past week or two the *habitudes* of the telegraph offices in this city, have been at times listening to the ticking of two clocks, one in San Francisco and the other at the Cambridge Observatory, in Massachusetts.

An instrument at one end of the table was the representative of the Cambridge time-piece, while an instrument at the other end of the table performed a like service for the one in San Francisco. The armatures of the respective instruments were connected with a piece of metal, so that their working, which exactly corresponded to the oscillations of the pendulums to which they were connected, produced a sound which was an exact imitation of the ticking of a large clock. The illusion was perfect, and the operation of the electric current being practically instantaneous, time and space seemed annihilated, and the listener was within ear-shot of points four thousand miles distant.

These interesting processes were carrying out a plan finished on Monday night, to determine, by the use of the overland telegraph, the difference in longitude between the observatory at Harvard University and one of the coast survey stations on the Pacific coast, the point selected being San Francisco. Other important determinations were to be made at intermediate points, the latter, however, to be subordinate to the first. The intermediate points selected were Omaha and Salt Lake City. The observations at Cambridge were put in charge of sub-assistant A. T. Mosman, aided by F. Blake, Jr., of the coast survey department; at Omaha, assistant Edward Goodfellow, aided by Mr. S. C. Chandler; at Salt Lake City, assistant Geo. W. Dean, aided by F. H. Agnew; at San Francisco, assistant

George Davison. The observations were commenced about three weeks ago, the Western Union Telegraph Company having tendered the Government the use of their lines for the purpose.

The following dispatch received here on the 28th ult., is the best explanation of the proceeding which was throughout one of great value to science.

#### SUPERINTENDENT DEANE'S DISPATCH.

SALT LAKE, Feb. 28.

To Gen. Stager, Chicago, and Prof. Winlock, Cambridge, Mass:

The following is the programme for measuring the time of transmission of clock signals between Cambridge and San Francisco.

I propose the following plan for measuring as accurately as possible, the time of transmission of clock signals, between Cambridge and San Francisco.

1. The wires between San Francisco and Cambridge to be arranged in seven (7) circuits, with six (6) repeaters, and in the same manner as has been required for making our longitude determinations across the Continent.

2. At Boston or Cambridge a repeater will be required to return the San Francisco clock signals through a second circuit, requiring six additional repeaters, thus making thirteen repeaters and fourteen circuits.

3. As soon as the telegraph circuit shall be arranged, with a careful operator in charge of each repeater, the clocks at San Francisco, Salt Lake City and Cambridge should be placed in the circuit.

4. The clock at San Francisco is arranged for sending signals every two (2) seconds. This should be done for five (5) minutes, which will give each operator sufficient time to adjust his repeaters, and thereby insure the successful return of the clock signals to San Francisco at least one (1) minute in five (5).

5. Should, however, this experiment from any cause fail of success, Cambridge will send clock signals for five (5) minutes, which will be recorded at Salt Lake City and San Francisco.

6. If practicable, the two circuits will then be connected at Buffalo, thus placing eleven (11) repeaters in the circuit. San Francisco will again send clock signals every two (2) seconds for five minutes, as in the former experiment.

7. The circuits, if practicable, should next be connected at Chicago, and with nine (9) repeaters in the circuit, San Francisco will send signals for five (5) minutes as before.

8. The circuits should next be joined at Omaha and the San Francisco clock signals repeated for five (5) minutes, as before, but through seven (7) repeaters only.

9. The circuits should next be joined at Cheyenne and clock signals sent through five (5) repeaters; meet at Salt Lake City through three repeaters; and finally at Virginia City, through a single repeater.

10. It is desirable that we be informed in regard to the kind of battery, the number of cells and the kind of repeater used at each station in making these experiments.

GEORGE W. DEANE,

Asst. U. S. Coast Survey.

#### THE PRELIMINARIES.

The first proceeding was to make the necessary comparisons of time-keepers at the different points, for which purpose the electrical connections with the pendulums, already referred to, were made. At a given point in the oscillation of the respective pendulums the electric circuit is broken, and a notification is instantaneously communicated to the different connections upon the circuit, by the click or ticking of the armatures. These observations are based upon the assumption that the passage of the electric current is instantaneous. While this may not be true theo-

retically, when it is recollected that the commonly received estimates of the rate of speed at which electricity travels, is over 100,000 miles per second of time, it is practically so. There is also another imperceptible loss of time in the transmission of signals between these remote points. Owing to the great length of the lines, nearly 4,000 miles in round numbers, the insulation of air lines always being imperfect, it is necessary to use "repeaters," each of which, in the performance of its functions, must occupy an infinitesimal portion of time. However, the adjustment of the clocks to within tenths of a second is considered sufficiently accurate, and as these unmeasurable losses do not amount, in the aggregate, to nearly that fraction, they are unimportant.

To ascertain the variation of the clocks at San Francisco, and the intermediate points named, the standard being mean time at Cambridge, a series of comparisons on six favorable nights were to be made. This much has already been accomplished, and the variation of the San Francisco clock is found to be three-tenths of a second, it being that much slow. Insignificant as that variation seems, it will be found by a simple mathematical calculation, that in determining the longitude of a given point within a few feet, it is important, as, reduced to distance, it equals nearly one-tenth of a mile.

Having adjusted the clocks, or ascertained their exact variation, the remainder of the process is quite simple, though instruments are called into requisition which are marvels of mechanical perfection and ingenuity. These are the transit instrument and chronograph. The former is a telescope attached to an axis pointing to the east and west points of the horizon, being susceptible of a vertical motion in the meridian upon which it is placed. A wire is drawn across the center of the instrument so that the transit of the star toward which it is directed can be instantaneously and accurately noted. The chronograph is a very ingeniously constructed instrument, which, by means of an electrical connection, instantaneously records the precise moment of the transit, to the smallest fraction of a second. The comparison of the clocks being completed, and the instruments in readiness, all that is necessary to complete the observations are a few favorable nights. A certain circum-polar star is agreed upon for observation, and the operator at Cambridge observes, by means of his transit instrument, the precise moment of its transit or passage past that meridian, touches a key, and the time is faithfully recorded upon the chronograph. The operators at San Francisco and the intermediate points, are signaled, and in about an hour the revolution of the earth from east to west has brought the star in a vertical position to the observer at Omaha; its transit at that meridian is noticed and recorded, as at Cambridge. Two hours and a half later, the star, having performed the same office for the observer at Salt Lake, has reached a vertical position to the operator at San Francisco. These operations are repeated a sufficient number of times to insure their accuracy and a reduction of the difference in time between the different points to degrees gives the exact difference in longitude.

The last test was made upon Sunday night, the 28th ult.; and then was accomplished the most remarkable telegraphic feat upon record. The working of a continuous wire from Boston to San Francisco is a wonderful achievement; but for the purpose of getting the exact time occupied in the passage of a signal, from one point to the other, a double wire was connected through, from San Francisco to Cambridge and back, thus making a circuit of 7,000 miles. San Francisco sent his signals east upon one wire and they returned to him upon the other, after a trip across the continent and back—the time of the signals, departure and arrival being accurately indicated upon a chronograph.

In making up this immense circuit thirteen repeaters and as many more intermediate galvanic batteries were used, so that the impulse, when once started upon its long journey, never grew faint, but found a fresh impetus given it every few hundred miles. The operation of the wires and instruments was watched with the utmost care by experienced telegraphers throughout the entire distance. The route of the circuit was from Boston, via Albany, Buffalo, Detroit, Chicago, Omaha and Salt Lake City. That the experiments were successful, and the performance of the telegraph of its duties were appreciated by the eminent professors who had charge of them, is shown by the following telegram:

SALT LAKE CITY, March 1.

Gen. Anson Stager, General Superintendent, Chicago:

The coast survey experiments last night for measuring the time of transmission of clock signals through a complete telegraph circuit of 7,000 miles was a brilliant success, and every gentleman who took part in the experiment is deserving of the highest commendation for prompt attention to business.

GEORGE W. DEANE,  
United States Coast Survey.

The following, from Superintendent Davidson at San Francisco, gives the result of the experiments:

SUPERINTENDENT DAVIDSON'S REPORT.

SAN FRANCISCO, March 1.

To Gen. Stager, Chicago, and Gen. Eckert, New York:

"My hearty thanks for the use of the two through lines; they worked splendidly, and my experiments for the time of transmission of signals from San Francisco to Cambridge and back, according to the plan devised, were a decided success. The time occupied for a signal to pass through seven thousand miles of wire, thirteen repeaters, etc., was about eight-tenths of a second.

GEORGE DAVIDSON, U. S. C. S.

### The Telegraph.

THE TELEGRAPHIC SYSTEM IN THE UNITED STATES COMPARED TO THAT OF GREAT BRITAIN—OUGHT THE TELEGRAPH SERVICE TO BE MANAGED BY THE GOVERNMENT?

[From the London Times, February 9.]

It may, perhaps, be forgotten by the public, and it does not seem to be remembered by the government, that an act was passed last session for taking over the various telegraph lines in the kingdom and placing them under the administration of the post office. The proposal provoked some sharp debates in Parliament, and was encountered, as cannot be denied, by arguments of considerable force. We ourselves never attempted to disguise the objections to which the measure was exposed, though they derived, perhaps, their chief cogency from its premature and unseasonable production. Whatever might be said for the scheme, it was certainly not a project of such incontestable advantage or immediate urgency as to justify the action of a government maintained in power for one purpose only. The business of Mr. Disraeli's administration was to pass the Reform Bill, and so allow of an appeal to the new constituencies on the question of the Irish Church. To this object its duties were limited, and though no opposition would have been offered to any piece of legislation at once necessary and expedient, it was impossible to allege such a justification for the Telegraph bill as first introduced. In point of fact, the objections to it, though somewhat partial or conditional in character, were echoed from all quarters. The measure might be a judicious measure—probably was so; but the way to it could not be clearly seen, and many points required both elucidation and reflection. However, though the late Minis-

try might as well, perhaps, have left the matter for their successors, they chose to persevere, and after due inquiry, debate and arrangement, the act was passed. It is now asked what has become of it, and whether it is to be put in force or suspended for a reopening of the whole question.

Just at this moment, as will be seen from our American correspondence in another column, the very same question has been raised and discussed in the United States, and when we observe that the proposal has found no favor out there in the opinion of the public, it may be thought that the Americans, who certainly know more of the subject than we do, are setting us an instructive example. A little attention, however, will soon show the wide difference between the two cases. In America the telegraph, as worked by private companies, represents a most successful example of cheap and popular organization; while the post office, as worked by government, represents a business conducted at a loss. Naturally, therefore, when it is proposed to transfer to an unsuccessful department of State a branch of enterprise already managed to perfection by private hands, the suggestion finds little favor. But in England these conditions are directly reversed. It is the post office which is the model of successful administration, while the telegraph system is so managed as to lose half its usefulness. Our conclusion, therefore, would naturally be the reverse of that reached in America, and we should look with approval on the proposal for taking over the business of the several companies and vesting it in the authorities of the post office.

It would be unfair to disguise that this argument, though substantially valid, requires in one particular material qualification. The American post office does a losing business, not because it is ill managed, but because the service is necessarily expensive, and because it is conducted with great liberality and most judicious consideration for public interests. The department does more for the public and for the press than is done in this country, and the Americans get their money's worth for their money. We need not, therefore, disparage the American post office, but, on the other hand, it is impossible not to admire the American system of telegraphs, and to ask why we cannot be provided with a service as good. Without attempting to distribute the blame of the failure, we may simply say that hitherto our telegraph system has failed to become what it ought to be. It does not give us cheap, popular, and available means of communication. The wire is not nearly so much in use as it might be. A telegraphic message is a rare and exceptional thing. Telegraph offices are but thinly scattered over the country, and the charge made for the transmission of a few words is so high that, except on occasions of urgency, the money is grudged. Contrast with this our correspondent's description of the state of things in America, where the telegraph offices are upward of 4,000 in number, or one for every 7,000 of the population, and where "over 50,000 miles of line and 100,000 miles of wire, with 265 submarine cables," are incessantly at work for the accommodation of the public. Still more striking is the comparison in respect of charges. In the year 1867 one company alone delivered to the American press just about 300,000,000 words of news matter, at a cost of £100,000; whereas in Continental Europe a service of about the same extent cost no less than £2,300,000. Such contrasts are absolutely conclusive. It cannot be a matter of doubt that our telegraphic system requires complete reorganization and development to fit it for the needs of the age. The only question is, or rather was, how that reform should be accomplished.

It was alleged on behalf of the Ministerial proposal that the post office, by availing itself of its existing organization, could manage the telegraph service so

economically, and at the same time give it such effectual extension, as to insure the very results desired. The use of the wires could be materially cheapened, and means of such communication brought almost to every man's door. If we could not get a telegraph office in every town and village, as in America, we should get many more offices than we have at present, and every district without an office of its own would be placed in close connection with the office nearest to it. The concentration of management in the hands of a single department, instead of a group of companies, would of itself tend greatly to economy, and, in short, it was plainly said and freely admitted that if the control of the administration of the telegraph service were to be transferred from private hands to the State, the post office, and no other, was the department to be charged with the service. The objections were of two kinds—one involving a point of principle, the other only a matter of detail. We in this country are naturally and wholesomely jealous of government action so distinguished from private enterprise. We like to do our own work instead of letting the State do it for us, and it would be vain to deny that misgivings might be entertained of the result in the instance before us. Many persons thought, and, indeed, openly said, what people are now saying in America, that "the telegraph, if placed under government control, would soon become a mere political machine, devoted, not to transacting the business of the public, but to securing the ascendancy of party." That, perhaps, was an extreme view of the case, but suspicions of a similar kind were actually expressed by some of our most prominent statesmen; and, indeed, it would have been strange if the proposal had not brought such objections to light. On the other hand, in the mere way of detail, there was the obvious difficulty of bargaining with the companies on terms at once acceptable to them and not unjust to the public. On this point, as might be expected, there was a strong conflict of views, but in the end a conclusion was reached with which we have no desire to quarrel. We may trust, we hope, to the vigilance of opinion for the safety of public rights, and in the meantime we are promised a large development of telegraphic service on cheap and easy terms. That was the bargain, and we now expect to see it effectually carried out.

### New System of Telegraphy.

The *Paris* of Paris of the 19th ult., contains the following communication:—

This morning the Emperor Napoleon III. consented in the Tuileries to examine the new system of telegraphy invented by the late Mr. Bonelli, witnessing some practical and complete experiments. His Majesty declared himself satisfied on every point with the process and invited the operator to return at noon, in order that the Empress might be present. The advantages of the new process consist in the perfect and authentic exactness of the messages transmitted, the importance of which is too apparent to require comment. Furthermore, this system allows the transmission of three messages in the same space of time that is occupied by one in the ordinary manner in use at present.

His Majesty considers the advantages of this new system so important that he authorized Count de Vougy, general director of telegraphs, to offer the operator every facility necessary to render the use of his apparatus popular.

A message was received at Adrian, Mich., lately from one of the neighboring offices in the following very sick condition:

Adrian Of

Wilt yov please gi4e me tpe laniff lo Polly Micpigan.

## A New Paper.

[From the Leavenworth Times and Conservative.]

"On the 23d of January the Directors of the Western Union Telegraph Company voted to establish a daily paper in New York City, to be called *The American Telegraph*.

"The matter had long been debated, but never assumed shape until the date we have mentioned. Mr. Orton, the President of the Company, had been in Washington since the first of December, fighting the Postal Telegraph. O. H. Palmer, Esq., the Secretary of the Company, well known as a leading lawyer in Rochester, N. Y., and as the Colonel of the 13th New York regiment, had been for a long time urging the starting of a newspaper by the Company. In this plan he had been seconded by Isaac Butts, Esq., who has had some twenty years of editorial experience, and by a brother of ours, Samuel Wilder, who is also a resident of Rochester, and who was a Director in the Russian Extension.

"The injunction of secrecy in regard to this matter, we presume, is removed. The facts will, in any event, soon be published, and may as well come from Kansas as from any other locality.

"The facilities possessed by the Western Union Telegraph Company for collecting news are, as all know, surpassed by no agency or combination whatever. They have twenty operators in New York city who can send news from every locality (we give the number at random and not from actual information), a large number in Boston, Philadelphia and other leading cities. A few years ago they had four or five in a city no larger than Rochester. In addition to this, they have an operator in almost every town in America. Wherever the telegraph goes this Company has a correspondent, and the new paper will have a special telegraphic agent in every locality."

We have always known that Mr. A. A. Wilder, of the *Leavenworth Conservative*, was a scholar and a gentleman, a master of several languages, and eligible for either the United States Congress or General Grant's cabinet, but we never suspected him to be a poet. Yet here we have him full of the "afflatus divine," in a flight of imagination inconceivable to an easy chair within reach of cold water and fresh air. Never did A. A. Wilder build a wilder conceit, or string together a wilder mess of unreal and unimagined things beneath so grave and reverend a style as in the article which we quote above. And yet it is said with so much particularity, and with such a sense of favored confidence in the value of a great secret to the *Conservative* confided, that we do not wonder to find it extensively copied and criticised. It has given fresh occasion to many little barkers who fret at all things larger than themselves to set up a new chorus on monopoly, and there will probably be a series of concerts with full orchestra round the entire circle until a denial comes or their wearied voices sink into indignant rest.

We need not say that the project thus announced is simple imagination and utterly without foundation. No such design has been entertained or even thought of by either of the gentlemen named, or by the Western Union Telegraph Company or any of its officers. There can be no doubt, however, that were it possible for a telegraph company having its wires, like those of the Western Union Company, connecting every town of the entire nation, with every operator a correspondent, to enter upon such a project, a paper of surpassing interest would be the result. Yet who can fail to admire the enterprise of the Metropolitan papers of our different States under their present arrangements, the number, the character, the vastly separated dates, the world-wide contribution to their mammoth columns! It is the marvel of our times. Nothing

proves so convincingly the spirit of the nation. The telegraph best fulfills its mission by serving the enterprise of such a press, rather than by seeking, in improper competition with it, success in a field it is not its mission to occupy.

## The First Telegraph Line between New York and Philadelphia.

The following appears in the *Washington Intelligencer*:

37 EAST CAPITOL STREET, February 25, 1869.

*Editors of the National Intelligencer:*

GENTLEMEN: I observe in your paper of this morning a letter from Hon. Amos Kendall to W. W. Corcoran, Esq., complimenting him on being the first subscriber of \$1,000 to form a company, in May, 1845, to erect a line of telegraph between the cities of New York and Philadelphia, to be worked by Professor Morse's invention.

Mr. Kendall states that he had promised to send Mr. Corcoran the original list, but, on searching for it, he found that it was not in his possession.

I have a copy of the articles of agreement, with the names appended, and, as it may now be of some little interest to the public to know who were the original patrons of the enterprise, I append the names and amounts subscribed.

Respectfully, yours,

B. B. FRENCH.

Corcoran & Riggs.....	\$1,000	Charles G. Page.....	\$500
B. B. French.....	1,000	George Templeman.....	200
Eliphalet Case.....	1,000	Henry J. Rodgers.....	100
Charles Monroe.....	1,000	J. W. Murphy.....	100
Peter G. Washington.....	200	A. W. Paine.....	500
John J. Haley.....	1,500	Francis O. J. Smith.....	700
John E. Kendall.....	300	J. Black.....	200
James A. McLaughlin.....	350	T. L. & A. Thos. Smith.....	200
Amos Kendall.....	500	Keller & Greenough.....	500
Ezra Cornell.....	500	J. C. Brodhead.....	500
Daniel Gold.....	1,000	A. Thos. Smith.....	100
Simon Brown.....	500	John W. Norton.....	1,000
A. J. Glosbrenner.....	500		

If this list is published in honor of the men who commenced a great enterprise, we have a word or two to say also. They are entitled to all praise. We would not take a feather from one of them. To one of these gentlemen, however, we think it due to make special reference. Corcoran & Riggs were opulent bankers and could afford to risk \$1,000 in a scheme whose capacity had been demonstrated in their presence. All honor to them for their encouragement. It was different, however, with the second name. B. B. French was not rich, but not only gave his \$1,000, but added thereto the most enthusiastic labor, even when New York millionaires laughed the enterprise to scorn and not a dollar could be got in all this great city. Largely through him the first Congressional appropriation was secured; the first telegraph meeting was held at his office, he was the first President of the Magnetic Telegraph Company, gave the most enthusiastic support to Prof. Morse in all his conflicts, and still watches his career and the progress of the telegraph with all his early enthusiasm. No telegraph man will grudge Major B. B. French this just remembrance. It is all his early generosity has yielded him. God bless him!

Of Hon. Amos Kendall we need not speak now. His connection with the telegraph requires an article by itself as long as a volume. All know his agency and care in its early introduction. We shall have occasion to speak of him anon.

The name of the Hon. Ezra Cornell also appears in this first list of subscribers. To this subscription of \$500 dollars may be traced the existence of the Cornell University, which has excited the interest of the civilized world, and brought its ripest scholars to its service. It is a grand comment on the benign mission of the telegraph itself, thus fructifying in an institution which is already encircled in the kindest benedictions of the American people.

In the department of toil connected with the early introduction of the telegraph, the editor of this paper had a full share, but he, like many more of his co-laborers, find their honor in the quiet and unspoken pleasure of their connection with so grand an enterprise.

## From our Paris Correspondent.

PARIS, February 25, 1869.

DEAR SIR: You must excuse my delay in writing you, but had I written you earlier my answers would not have been sufficiently precise.

You have asked me what was the system of batteries used in France?

They prefer in France the constant batteries, and would rather use a greater number of constant cups than a small number of intense cups.

I know in America you use the Grove platinum and carbon battery. In France they are not admitted, because they are not sufficiently constant.

I give you a list of the batteries we use in France.

1. The Daniells battery, with copper in the porous cup and zinc in the glass cup.

2. The battery of M. Marie Davy. It is a carbon battery but without nitric acid. There is put into the porous cup with the carbon some bi-sulphates of mercury with water, and only pure water around the zinc. This is a very constant battery. In the central office, Paris, they have four thousand cups of this kind. They are constant for ten or twelve months. They only require the addition of a little water from time to time to supply loss by evaporation.

3. The "Pile a ballon" battery. This is a modification of the Daniells battery with which you are familiar, and which I saw in use in the United States.

4. The "Callaud" battery. Of this I give you a sketch.

Z. Zinc.

S.C. Sulphate of copper.

M. Sand for separation of sulphate of copper from dilute sulphuric acid.

N. Gutta percha covered wire connected with copper plate.

For the telegraphs near the sea, for the semaphoric service, they use the Dutch battery. It is a battery with carbon and zinc they put in the sea. It is both a very strong and a very constant battery. So much for batteries.

You have asked me what was our machinery in France. We use several systems.

1. The original Morse apparatus with indenting point.

2. The Morse apparatus with Digney's marking wheel instead of the indenting pen.

3. The John and Brequet modification of the Morse apparatus.

4. The Hughes printing apparatus.

5. The Caselli autographic system.

In the railroad stations they use the Brequet alphabetic system, or dial telegraph.

You ask me respecting operators' salaries. Operators receive 2,000 francs (or \$400) per annum. Engineers and inspectors from 10,000 to 12,000 francs.

Offices at large cities, as Paris, Bordeaux, Lyons, &c., are open day and night. Of the forty-six offices in Paris, twenty-four are open at all hours.

Minor offices are open from 8 A. M. to 8 P. M. I will be pleased to correspond with you and inform you of everything of interest.

Lately I have invented a magneto-electric relay for telegraphy. It is founded on a new system and can be worked with a very feeble current.

Your devoted friend, FRANCISQUE MICHEL.

A PROMINENT telegraphist of Oswego proposes to build a velocipede with flange wheel to run on one track, for the use of telegraph repairers in case of a break in the lines. He calculates he will be able to "go for it" at the rate of sixty miles an hour.

"WHERE is the East?" inquired a tutor one day of a little pupil. "Where the morning comes from," was the prompt and pleasant answer.

\* Remitted three dollars.

† Remitted five dollars.

‡ Remitted three and one-half dollars.

**THE NEW POSTAGE STAMPS.**—The new style of postage stamps will shortly come into use. The new two cent stamp is to have a mounted post boy at full speed, indicating that this stamp is mostly used for dispatched letters; the three cent stamp has a locomotive, surrounded by three lines of lightning, showing that letters so stamped are to travel as fast as possible; the five cent has a microscopical view of the painting representing the signing of the Declaration of Independence; the twelve cent stamp, mostly used for foreign postage, has a steamer at sea; and the thirty cent stamp has a painting of the surrender of Burgoyne, which will, no doubt, be a very pretty stamp in the eyes of the Britishers.

## A New Method of Catching Mice.

A correspondent of the *Journal of Pharmacy* says: "Having on several occasions noticed mice in our seed barrels, I bethought me of some method how I might trap the little intruders, they having gained entrance by eating through the chime. To kill them with a stick was impracticable, as the little fellows would invariably escape as soon as the lid was raised to any height. I then thought of saturating a piece of cotton with chloroform and throwing it in, then closing the lid. On raising it again in a few minutes, I would find that life had almost or quite departed. Having on one occasion left the piece of cotton in the barrel, on again returning, found three mice with their heads in close contact with it, and dead. In the evening I saturated another piece, and placed it in the barrel, and on opening it next morning, to my surprise I found nine dead mice." We recommend our Chicago friends to try chloroform on their rats, and see what effect it will have.

## Improvement of the Telegraph.

[From the American Railroad Journal.]

One of the great drawbacks heretofore in the efficiency of the telegraph has been defective insulation. To work a circuit that is free and clear of escape is always an agreeable and pleasant occupation, while operating one that is ever changing and requiring continued adjustment of magnets is one of the most annoying and patience trying. Many of our railroads have improved their telegraphs during the past season by the use of the Brooks Insulators. With this invention much of the time formerly spent in adjusting the magnet can be devoted to other, and clerical duties, besides the liability to error is infinitely lessened. The galvanometrical tests and measurements of the amount of leakage show not as much escape over a line of one hundred miles in length, where the Brooks Insulators are used, in a very wet day, as over one insulator of the ordinary kind, and that there is more leakage over the ordinary insulator in a clear frosty day than over the Brooks in the most humid weather.

The following is the letter to which we replied in our issue of March 1:

## The Sabbath.

AUGUSTA, Ga.

EDITOR JOURNAL OF THE TELEGRAPH:

Your "note" to the article from the *Times*, published in your number of February 1st, entitled "A Day of Rest," calls forth hearty amens from all operators.

I desire a small space in your columns to present a few thoughts based upon it. The hours now used for Sunday work (from 7½ to 10 A. M., and 7 to 9 P. M., the principal offices being kept open all day), are such as manifestly destroy the rest of those whose turn brings them on duty Sundays. After an operator has been at his office during the hours above mentioned ('tis often much later before all is "square"), engaged principally with commercial messages, he has but little inclination and is often too late to attend divine service. Should he do so, his mind is in no condition to profit by and enjoy that quiet and devout meditation and physical "rest" which a due observance of the sacred day should engender. The night hours deprive him of all chance for attending church. Is it any wonder then that so many operators totally ignore church going and seek, as best they may, the physical enjoyment only of the few intervening hours?

Admitting your remarks, that "the public interest and the claims of humanity seem to require that during some period of the Sabbath the telegraph be accessible," I think two hours amply sufficient for such claims. Commercial business ought not to be received on Sundays; therefore, I would suggest from 12 to 2 P. M. as the best. The public would soon adapt itself to these hours. This would give all the opportunity to enjoy the benefits and profits of church worship, morning and evening. After service, operators "on duty" could go to the office and square up before their dinner hour. Then they would not feel, as I often do on Sunday mornings, that though designed by our kind Heavenly Father as a "day of rest" and to be "kept holy," 'tis not such to us—"office must be opened on time." AN OPERATOR.

SALT LAKE CITY, March 1, 1869.

Hon. WM. ORTON, President Western Union Telegraph:

The Coast Survey experiment last night, for measuring the time for transmission of clock signals through a complex telegraph circuit of 7,000 miles, was a brilliant success, and every gentleman who took part in the experiment is deserving of the highest commendation for prompt attention to business.

(Signed)

G. W. DEAN,  
United States Coast Survey.

## The Magnesium Light.

Great expectations were raised with reference to this light as soon as a method was discovered for the cheap preparation of the metal. When magnesium is burned it emits a light quite unendurable to the naked eye, and it only remains to consider the most economical manner in which the combustion can be carried on. When the pure metal is employed it gives rise to a voluminous white cloud of the oxide of magnesium, that obscures the reflectors and eventually fills the room where it is burned.

Various attempts have been made to absorb this vapor, and thus remedy the difficulty. By alloying the magnesium with zinc the quantity of light is not diminished, and the fumes are more readily removed. An alloy with the new metal, thallium, has been very successfully tried. A lamp has been patented for burning finely divided magnesium mixed with sand, and made to pass through an hour-glass arrangement on to a small flame. The mixed sand and metal are then fed regularly into the flame, and the light emitted is very intense. In other lamps the magnesium, in the form of wire or ribbon, is unrolled from a reel and fed into the flame.

In all cases there is the same objection of smoke, so that where the light has been used for photographing the interior of caves, it has become necessary to suspend operations after a short time, until the cloud could disperse. Notwithstanding all of these disadvantages the magnesium light is extensively employed in photography and in microscopic investigations. It has the great convenience of being independent of any battery or extensive gas-flame, as it can be ignited with a match, and will take care of itself.

## Memorable Dates.

- 1180, Glass windows first used for light.
- 1246, Chimneys first put to houses.
- 1252, Lead pipes for carrying water.
- 1290, Tallow candles for light.
- 1299, Spectacles invented, by an Italian.
- 1302, Paper first made from linen.
- 1341, Woolen cloth first manufactured in England.
- 1410, Art of printing in oil.
- 1440, The art of printing from movable types.
- 1477, Watches first made in Germany.
- 1540, Variations in the compass first noticed.
- 1543, Pins first used in England.
- 1590, Telescopes invented, by Porta and Jansen.
- 1590, Jupiter's satellites discovered, by Jansen.
- 1601, Tea first brought to Europe from China.
- 1603, Theatre erected in England, by Shakespeare.
- 1610, Thermometer invented, by Sanctorius.
- 1619, Circulation of blood discovered, by Harvey.
- 1625, Bricks first made of any required size.
- 1626, Printing in colors invented.
- 1629, Newspaper first established.
- 1635, Wine made from grapes, in England.
- 1639, Pendulum clocks invented.
- 1641, Coffee brought to England.
- 1641, Sugar cane cultivated in the West Indies.
- 1643, Barometers invented, by Torricelli, in Italy.
- 1646, Air guns invented.
- 1749, Steam engines invented.

BRIGHAM YOUNG is said to have a telegraph wire leading to his office and connecting with every hamlet in Utah—a line of 600 miles long. Every settlement of half a dozen houses has a telegraph office with female Saint operators, and in charge of a Bishop of the Mormon church, who can report at any time all that takes place to Young. From his private office in Salt Lake City, like the watchman in the fire telegraph, Brigham may give an order or ring an alarm from Idaho to New Mexico.

## Telegraphers'

## Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

## DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *After Hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## The Swindle that was not Consummated.

Some rich and interesting developments in the management of fancy stock companies were concealed from the public, when the Atlantic and Pacific Telegraph Company abandoned its suits against Messrs. Daniel L. Harris, Gurdon Bill, James D. Brewer and George M. Atwater of this city. The suits were brought in the name of Richard J. Thorne, trustee, to compel those gentlemen to pay an assessment of 95 per cent. on their subscriptions to its stock, amounting in each case to \$950. Soon after agreeing to take the stock they learned facts which led them to suspect that the scheme was a stock-gamblers' swindle, and on this ground refused to pay any of the assessments, and on the same ground prepared to defend their cases in courts. In their answer to the allegations of the Company, filed with the clerk of the courts, they admit that they signed the contract to take stock, but declare that they were induced to do so by false and fraudulent representations. They were assured that the telegraph company was building and had the right to build a telegraph line from Boston to St. Louis, and that it had made a very advantageous contract with Elbert H. Van Kleeck (a synopsis of which was presented to them) to build a line from New York to Chicago for \$200,000. They deny most positively that these assurances were true, and say that the property of the Atlantic and Pacific Telegraph Company, if there is any such concern legally in existence, is not equal in value to the capital stock, but that the capital stock represents a value many times in excess of the reasonable cost of construction. They also declare that the synopsis of the contract with Van Kleeck was designedly intended to deceive, and that the company had contracted with him to construct the line at a price greatly in excess of its fair and reasonable cost. Here is another of their allegations, minus some of its legal verbiage:

"One E. H. Van Kleeck, the party in interest in this suit, confederating with Harrison D. Hunt, Edwin Thompson and Joseph Tuppert, Jr., to defraud the public, caused the corporation to be organized, and when so organized, entered into a contract with E. H. Van Kleeck, whereby, for the pretended consideration of his agreement to construct and furnish 3,000 miles of telegraphic lines, they agreed to transfer to him 50,000 shares of the capital stock of the corporation, the same being all the stock of the corporation; and Van Kleeck proceeded to obtain subscriptions for the stock, as if for the use and benefit of the company, whereas all the subscriptions and all the money received therefrom was received for the benefit of Van Kleeck and his associates, and not the corporation. And the organization of the corporation and all the acts done under it were done with the intent to enable Van Kleeck, for his own and his confederates' benefit, fraudulently to sell the stock, under pretense of acting for the corporation, at a price greatly in excess of any equivalent furnished by him to the corporation."

Grave charges, surely, but Messrs. Harris, Bill, Brown and Atwater went into court fully prepared to prove them. Such audacity was quite unexpected by the New York "wild cats," who evidently supposed that to threaten a suit at law would be to extort the money they wanted. But they counted without their host; and, not fancying the expose which they were fully aware would come out if the cases went to trial, they wisely abandoned them. A record of the fact was made, and the New Yorkers were thus prevented from ever renewing the suits. If every man who is deceived by the misrepresentations of stock-jobbers would be equally tenacious in holding on to his money, and equally earnest in fighting the men who would like to bleed him, there would be a large falling off in the amount of this peculiar style of swindling.—*Springfield Daily Republican*.

BATAVIA, N. Y., March 1, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

We send you enclosed death of another of our number, Harvey J. Moore, late operator of the Western Union Telegraph Company, at Niagara Falls, N. Y. He was a good operator, a young man of excellent habits, beloved by all who knew him, and leaves many friends to mourn his death. He has been employed by the Western Union Telegraph Company about four years.

Yours, respectfully,

E. G. T. ADAMS,

Operator W. U. Tel. Office.

JAMES D. YOUNG,

Operator Erie Railway Office.

## Another Happy Man.

PRESENTATION.

On Saturday evening Mr. Read, who is manager of the telegraph office at Rutland, Vt., was made the recipient of a most elegant silver service, consisting of an ice pitcher, salver and two goblets, from his numerous telegraphic friends whose names appear below. The articles were from the establishment of Messrs. Giddings & Adams, and were elaborately chased. The inscription upon the pitcher was as follows:

"L. READ"

"73"

1 N. 1 &amp; 3 S.

Feb'y, 1869.

The figures "73," in telegraphic parlance, means "compliments of," while the "1 N. 1 & 3 S." indicate the wires over which the operators who made the present preside. The goblets and salver were also each marked with the letter "R." The service was presented, in behalf of his friends, by Mr. I. W. Copeland, of Brandon, in the following happy speech:

MR. L. READ, Manager Rutland Office—Dear Sir: We desire to express our appreciation of the many favors received at your hands, by the presentation of this service, as a token of our respect, believing that the current flowing from this fountain will always be steady, hoping your lines in life will seldom get crossed, that your error sheets can be settled without stamps, that we shall always be able to taste your battery, and as your line lengthens we trust that you will conclude to make use of a repeater, that the repairer will keep you well insulated, and the time be far distant when you will be grounded. With great respect, etc.

J. N. Hills,  
E. T. Page,  
B. H. Lee,  
F. M. Mead,  
M. E. Johns,  
J. S. Hickok,  
O. Smith,  
G. Marshall,  
I. W. Copeland,  
A. D. Tiffany,  
W. G. Jamieson,  
O. F. Spaulding,  
J. H. Goulding,  
J. Leamy,  
A. Clark,  
M. Wilbur,  
W. W. Parks,  
E. Rich,  
F. N. Blanchard,

W. B. Eddy,  
T. T. Shurtleff,  
E. D. Bennett,  
H. W. Spafford,  
G. C. Kendall,  
L. C. Orris,  
S. Grout,  
E. B. Bond,  
I. A. Pooler,  
E. G. Mason,  
J. A. Spafford,  
C. T. Hawley,

J. E. Austin,  
L. Johnson,  
J. H. Reynolds,  
D. G. Morgan,  
B. G. Rice,  
C. E. Murray.

Mr. Read, although taken unawares by his friends, thanked them most cordially for this most elegant testimonial of their regard, and said he should value it most highly, not for its intrinsic value, but as coming from the source it did and in such a manner.

For every evil under the sun,  
There is a remedy, or there's none.  
If there is one, try and find it,  
If there is none, never mind it.

THE PNEUMATIC DISPATCH.—"It appears," says the N. Y. World, "that the human tides of Broadway are, and for the last three weeks have been, surging along, unconscious of a hollow gulf beneath them, other than the iron gasmain and the swashing, central sewer. An underground march has been stolen beneath the great thoroughfare by a corporation called the 'Pneumatic Dispatch Company,' which obtained its charter at the last session of the Legislature, and of which Moses Beach is President. Starting from the cellar under Devlin & Co.'s clothing store, at the corner of Broadway and Murray street, the company's miners penetrated to the centre of Broadway, and are now opening a tunnel from there down town at the rate, it is said, of about ten inches per day. The lower section of the tunnel is to terminate at the New York Post office; though when it will reach that destination the mysterious directors of this burrowing enterprise do not announce."

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its offices and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MARCH 15, 1869.

### The Delivery of Dispatches.

There is no department of the telegraphic service so important as that which has to do with the delivery of messages after their telegraphic reception. The manipulation of a message over the wires, seemingly the most important part of the process, is simple, easy, and, of necessity, rapid. There grows no grass beneath the feet of Mercury when let out upon his aerial mission. Quick, sharp, exact, every impulse is synchronous, so that *sending* and *sent* become synonymous. One thousand or ten thousand miles, the electric current loses nothing of its fleetness, but, obedient to the finger of the operator, instantly responds across a continent, or in other continents, "Here am I." But, when the message has arrived at its telegraphic terminus, there begins a process of detention which requires the most faithful and sleepless management to limit to the barest necessity, and a series of tricks which the ingenuity of messenger boys only can invent. Here may be found nine-tenths of the trouble of telegraph companies, and the annoyances of those who use the lines.

Without entering fully into all the sources of anxiety connected with the employment of messenger boys to deliver dispatches, we, at present, refer to one only. Here, for example, is a gentleman in St. Louis, who, designing to go up in the evening train to Alton, or elsewhere, to visit some friends, telegraphs them that he hopes to be with them to tea. This he continues to do at different times, always notifying his friends of his designs, and paying, as he must, for his dispatches. One evening, as he and the young ladies, who are the sweet occasion of these frequent visits, sit on the balcony, conversing on divers matters in which the telegraph has its appropriate place, he is extremely annoyed to hear one of those troublesome brats who are always interfering with young ladies' secrets, sing out: "Yes, Mary has to pay fifteen cents for every message you send her; that telegraph boy makes heaps o' money, I bet." The gentleman inquires, alarmedly, what the boy means, and learns, after many blushing apologies, that it is even so, although the home of the family is but a few squares from the telegraph office, and has a messenger hired for the purpose of free delivery. Of course the gentleman becomes angry, just as we did when we were similarly used in a village not far from New York, and finds, on making complaint at the office, that the fifteen cents charged is a financial operation of the boy, which, it turns out, he has carried on for some time with impunity. Now caught and dismissed, he serves to illustrate one of the most mischievous practices which infect the system, and for which there must be found some mode of relief. When a dispatch has been paid for, the sender must have the assurance that the message will be delivered without further charge, or, it is clear, thousands of messages will be unsent because of dread of such an impost.

It should be understood that the Telegraph Company never make the delivery of messages a source of revenue, and that when a charge is made at all for such a service it is either a fraud, or because the distance of service from the delivering office renders such a charge just, or because upon the condition of paying such charges an office, such as are found at railroad stations, has been opened to the public. The general rule is to deliver all messages free within a reasonable radius of an office, and always so within the boundaries of towns and cities whose radius

does not exceed a mile, and the amount of whose business justifies the employment of a messenger. Our own impression is, that no message, except those distinctly understood to be payable on delivery, known as "collect" messages, should ever be allowed to bear charges for delivery. Until that becomes the universal rule, the business must be greatly hindered and made so far repugnant.

To do this universally, will, of course, require a wider and better knowledge of the conditions of delivery service, books of instructions adapted thereto, and distinct understanding with the parties sending as to location, &c. Yet we deem the subject one of the deepest importance, and now that the tariff is undergoing a searching examination, so as to establish it on a fair basis and within equitable limits, this kindred subject of the prepayment of delivery in every case, except on "collect" messages, may properly engage attention. Meanwhile it is due to the public that each telegraph office be instructed as to its duty in this matter, clearly defining the radius of free delivery and making the public acquainted therewith, so as to allow no opportunity for fraud and no excuse for misapprehension.

The great difficulty in the way of a universal free delivery is with the public. It is the result of experience that comparatively few people will state truly the distance of a dwelling from an office to which a message has been directed, and many will asseverate a residence to be only a square or two from an office which is in reality beyond the limits of the town. Were the public truthful, a system could be inaugurated with comparative ease which would remove the cause of many complaints, and induce a much larger use of the telegraph than now. It is our impression also that were all messages prepaid, and the losses and annoyances growing out of "collect" messages prevented, the telegraph companies would be able to inaugurate a universal free delivery.

We do not wish to be understood as speaking against the messenger boys. Far from it. We think of them as entitled to the utmost consideration and kindness. Their service is toilsome and important. But bad boys will find their way into the service, and some managers are not above collusion with them. A universal free delivery would remove much temptation and clear a very obstructed road for the increase of business.

### The Cuba Telegraph Cables.

In our last edition we were in error in stating the quality of the cable recently laid for the International Ocean Telegraph Company between Florida and Cuba as second only to that of the Atlantic cable, whereas both the Cuban cables are superior to it, and the last 25 per cent. better than the first. The published tables of the insulating power of resistance of these cables is as follows:

Atlantic cable of 1865.....	349
First Cuba cable.....	464
Second Cuba cable.....	580

This correction we are very happy to make.

The superior quality of this last cable must be a comfortable atonement for the difficulties connected with its laying. The narrative of the work of its recovery and final connection, as communicated to the Company by Sir Charles Bright, is before us, and is evidence of the patience and toil and exposure connected therewith, and for the details of which we will endeavor to make room. Cuba held fast to the United States by two stout cables should now be regarded as annexed.

The Governments of the following islands of the Antilles have voted subsidies for telegraphic connection by way of Cuba with the United States, as follows:

St. Thomas.....	\$5,000 per annum in gold
St. Christopher.....	6,000 " "
Guadaloupe.....	10,000 " "
Martinique.....	10,000 " "
Barbadoes.....	12,500 " "
Trinidad.....	12,500 " "
British Guiana.....	15,000 " "

And the Government of Surinam is discussing the provision of a subsidy of \$15,000 per annum in gold, which will no doubt be granted. The exports and imports of these islands amount to over \$160,000,000 per annum.

Thus an annual subsidy of about \$87,500 in gold is provided for the extension of the telegraph to these islands, by which they will be placed side by side with the markets and civilization of America and Europe.

It cannot be long before the two coasts of South America will be in immediate connection with the net work of wires which cover the North American continent, and may be a large stride toward the pacification of the hostile republics by the introduction of so important an element of union and intelligence. The value of all these connections to the Cuba Cable Company need not be stated. It ought to become one of the best paying investments of the entire telegraphic field, especially so if it should happen that the Spanish cable project, by which Spain and Cuba is to be connected, should be consummated. We are informed that the affairs of the International Ocean Company are in a gratifying condition, which the bland and comfortable appearance of its valiant President sufficiently denote.

### The Coast Survey Experiments.

The recent experiments by the United States Coast Survey to determine the longitude of the Pacific Coast by the telegraph wires, were of a most remarkable character, and brilliant above anything of the kind yet attempted. We have not space to allude to them at present further than to express our gratification at the result. Let any one imagine himself standing in a telegraph office between two wires—one going west to the Pacific and east to Cambridge, Mass., a distance of 4,000 miles, while the other, separated from it by a few feet, of equal length, connecting the same points, and attached to the other wire at its extreme end, thus making a circle of between 7,000 and 8,000 miles. All is quiet. Here is a small brass key, four inches long, at your right side. Lift it. What was that sound at your left—that clear, sharp click, indicating interference? Can you comprehend that you, in lifting that short lever the thirty-second part of an inch, robbed over 7,000 miles of wire of its electric life, and that in eight-tenths of a second it had told the story to fourteen States, had gone to the Pacific and back, twice the breadth of the Continent, and returned to you in less time than you can wink your eye? Touch it again as lightly as you please, and round this immense circle, from Boston harbor to the Golden Gate, the electric fire has returned as quickly as it went! Does it not stir the blood and stimulate the brain to stand in the circle of such suggestive wonders?

By the politeness of a friend in Chicago we are put in possession of copies of the Chicago *Republican* and *Times*, both of whom have excellent notices of these admirable experiments so far as they were known up to the time of their writing, one of which we publish for preservation.

The writer communicates the following additional particulars:

"The time occupied in a signal passing from Cambridge, Mass., to Buffalo and return, was one-tenth of a second; to Chicago, Ill., and return, two-tenths; to Omaha, Neb., and return, three-tenths; to Salt Lake City and return, six-tenths; to Virginia City and return, seven-tenths of a second; and to San Francisco and return, eight-tenths of a second."

What adds value to this whole interesting experiment is the fact that thirteen instruments had to repeat the act of depressing the key by the original actor, and yet all was performed in this mere fraction of a moment! Could a single unbroken wire have performed the service, and we believe it can, it would be found that the thrill of contact was instantaneous, and that the loss of time was caused wholly by the automatic machinery.

We expect to publish in our next number an interesting description of the process and the results arrived at, by an intelligent and competent hand.

These experiments illustrate another fact which thoughtful men have never doubted—the value of an organization whose wires reach the extremes of commerce and civilization. Of necessarily large proportions, and covering every avenue which living men tread to do commerce with each other or open up the earth's treasures, it has been subjected on that very account to bitter names, and to the keenest criticism. But this extension is vital to its own life and to public commerce. And now, when government needs to know the number of rods which separate Boston from San Francisco, a single star in the sky and the finger of a single operator of the Western Union Telegraph Company provides it.

## OFFICIAL STATEMENT.

## Another Death.

“There's a city vast yet voiceless, growing ever street on street,  
Whither friends with friends e'er meeting, ever meeting never greet.”

The year 1869 opens with graves. A dispatch from Cincinnati announces another laborer who has laid his burden down.

CINCINNATI, March 2, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

J. Frank Stevens, for sixteen years chief operator of the Western Union Telegraph Co. at Cincinnati, died this morning of consumption.

Geo. T. WILLIAMS.

We have been hoping to receive from some competent hand a fitting memorial of one we have long known and loved, but find the task left in our own most willing hands, although without the data to make it more than a passing notice.

Mr. Stevens was appointed by us to the position he has so long and worthily occupied on the 11th of June, 1852, taking the place of Gen. Stager, who at that time became connected with the House Printing Telegraph Co., which laid the foundation of the present Western Union Telegraph Co. It was a post of much responsibility, and required skill and discretion to execute usefully its peculiar duties. Gen. Stager had made Cincinnati, by his skillful management of the wires, the ruling office of the National lines, and that Mr. Stevens filled his place usefully and acceptably is high proof of his ability, if indeed any is needed.

Cincinnati has had in its working force some of the most skillful and excellent men which the business has produced. The two Durfees, long since dead, were notable examples of skill and fidelity. We cannot recall the names of others, except Gen. Stager, Calvin Holmes, Geo. B. Hicks, Stevens, Durfee, although their faces are well remembered. Mr. Stevens, although we have not seen him for fourteen years, we recall with a sorrowful pleasure as a kind, willing, self-sacrificing, genial and faithful friend and companion. We cannot believe that the lapse of years changed him in any of these qualities except to mellow them, and render him worthier of esteem. We had supposed him in good health, and hoped ere long to have visited him on our old field of labor. But he has closed his key for ever, and if we ever meet again we trust it will be where death dims nevermore human eyes, or interrupts human affections.

Mr. Stevens was a member of the Telegraphers' Mutual Life Insurance Association, and a call will soon be made for one dollar to replace the fund to which his heirs are entitled. The Committee delay the duty as long as possible to prevent embarrassment.

We wish to say here that where inability prevents remittance of assessments it should be made known. A number of kind gentlemen stand ready to help such when necessary. We wish we could print the letters written us from some of them. But they are too numerous, and we fear to offend.

Since writing the above we have received the following:

CINCINNATI, O., March 9, 1869.

At a meeting of the telegraphic fraternity of Cincinnati, called yesterday, to take action upon the death of their late chief operator, J. Frank Stevens, Mr. L. C. Weir was chosen as Chairman. Upon motion Mr. J. C. Mattoon was appointed Secretary. The Chairman then appointed a Committee of five to draft appropriate resolutions. The Committee consisted of Messrs. M. B. Graham, C. M. Knox, B. F. Bush, H. A. Pugh and B. B. Glass.

The Committee then prepared and presented the following preamble and resolutions:

WHEREAS, It has pleased the Almighty, in the dispensation of his Divine will, to remove from our midst our late friend and fellow operator, J. Frank Stevens, Esq.

Resolved, That in his death we mourn the loss of a valued friend, society a useful and worthy citizen, and the Company a capable and trustworthy officer, and one whose place it will be difficult to fill.

Resolved, That we tender to the bereaved family of the deceased our heartfelt sympathy in this their hour of affliction.

M. B. GRAHAM,  
C. M. KNOX,  
B. F. BUSH,  
H. A. PUGH,  
B. B. GLASS,  
Committee.

Expressions of regret and sympathy were received by telegraph from W. W. Smith, G. T. Williams, J. D. Reid, D. McCargo, C. E. Taylor, and many other friends from various points, and read to the meeting. The meeting then adjourned until ten o'clock, Sunday, March 14th, to take further action on the subject. There was a large attendance, and the utmost feelings of solemnity and regret prevailed.

L. C. WEIR, Chairman.  
J. C. MATTOON, Sec.

PARIS, February 27, 1869.

MY DEAR SIR—The French papers mention the experiments recently made in America in the use of electricity for the explosion of torpedoes in mines and wells, and the usefulness of the electric current for such purposes. The eminent electrician, Mons. Brequet, has just invented a new electro-magnetic machine which is regarded as possessing qualities superior to any now in use, and admirably adapted for the purposes above indicated.

It is very light, weighing about six pounds, of small size, and very useful for purposes of war. No battery is required, as it is a battery of itself. I have personally tested it, exploding four boxes full of gunpowder simultaneously at a distance of 150 miles, using the ground instead of a return wire.

It is called “Brequet's exploseur,” and from its effective qualities, low price (\$35 in gold) and small size, ought to be adopted by all nations, as it has already been in the French army.

Believe me, yours, &c.,  
FRANÇOIS MICHEL, Electrician.

## They Don't Like It.

It is very evident, from the tone of the English press, that the engulfing of the telegraph by government is regarded as a very doubtful delight. The statistics furnished from America has opened some very blind eyes, and the London Times confesses that had the private management of the English telegraphs been equal to those of America, no such arrangement could have been agreed to. So far no money has been voted to carry out the scheme agreed to. Leading statesmen are known to be opposed to it. We would not be surprised, and certainly would not be sorry, to see the whole plan upset, and the property remain in private control.

A VELOCIPED race took place at Nashua, N. H., last week. A silver cup offered for the quickest half mile at a trial of speed by the pupils in a Velocipede School, City Hall, was won, over nine contestants, by James Blake, late operator for the Northern Telegraph Line, in 2:50.

A TELEGRAPH line is about to be established between Buenos Ayres and Cordoba.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
MARCH 15, 1869.

To all Offices on W. U. Lines:

The following changes have occurred since March 1, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Brandon, Miss., reopened, tariff same as heretofore.	
Greensboro', Ala., “ “ Marion, Ala.	
Hicksville, L. I., “ “ Mineola, L. I.	
Huntington Depot, L. I., “ “ “	
Northport “ “ “	
Irondale, W. Va., “ “ Newburg, W. Va.	

## OFFICES CLOSED.

Deer Park, L. I., Letohatchee, Ala., and Rienzi, Miss.

## GENERAL INFORMATION.

[Note.—NO ORDERS TO CHANGE TARIFFS MUST BE UNDERSTOOD AS INCREASING EXISTING RATES.]

Hereafter all offices which have heretofore sent and checked business for Henderson, Ky., to Louisville, will send and check such business to Vincennes, Ind., tariff 80 and 6 from Vincennes TO OFFICES HAVING “SPECIAL SHEET A.”

Hereafter you will check Niagara Falls, N. Y., same as Suspension Bridge, N. Y.

Lafayette, Ind., will be checked at same rate as Chicago, Ill., and Indianapolis, Ind., at 25 cents more than Cincinnati by all offices east of Toledo, O., and Cincinnati; offices west and south will be furnished by their Supts. with rates to Lafayette and Indianapolis, Ind.

WILLIAM ORTON, President.

## Balata Insulation.

This covering for telegraphic wires we had occasion to note at the time of its introduction, and hailed it as a valuable addition to our means of bringing the telegraph to perfection. The wires in cities must either be placed under ground, inserted in a cable for carriage on poles, or be covered by some substance which will prevent the annoying contact occasioned by strings, hoop-skirts, kites, and the thousand and one ways in which they can be interfered with in our large cities. This covering must be unaffected by weather, so as not to crack or soften it, and must be of high qualities as a non-conductor, to be of essential service.

We have before us a specimen of balata covered wire made in 1867, which is as apparently perfect and elastic as it could ever have been. No crack nor hardness indicates change of condition, and it presents itself to us as a highly valuable material worthy of extensive use. The Bishop Gutta Percha Company have made arrangements to cover wire of any size with this material, and we commend it to the attention of our readers. Its quality as a superior non-conductor is guaranteed by the makers.

## Married.

At the residence of, and by the Rev. W. M. Cunningham, in La Grange, Ga., on the 16th February, 1869, J. W. Hoy, of the Western Union Telegraph Company, to Miss Ida Burke, all of La Grange.

On Thursday, March 4th, by the Rev. Leighton Coleman, Mr. F. C. Eckenberger, of Catsaqua, Pa., to Miss Sallie Snyder, of Mauch Chunk, Pa.

## Died.

At Key City House, Dubuque, Iowa, Monday, March 8th, of consumption, Lettie A. Watson, wife of Byron A. Squires, General Superintendent Mississippi Valley National Telegraph Company, aged 32 years. Remains have been taken to Oswego, N. Y., for interment.

In Batavia, N. Y., of typhoid fever, on the morning of February 28th, Harvey F. Moore, late operator Western Union Telegraph office, Niagara Falls, aged twenty-one years.

INVENTED.

Complete Sets (put up in working order), price \$400, \$450, \$500.

For further information, address:

THOMAS A. EDISON,

Care CHARLES WILLIAMS, JR.

Telegraph Instrument Maker,

109 COURT STREET,

Boston, Mass.

## SPECIAL NOTICE.

L. G. TILLOTSON &amp; CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON &amp; CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL O. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their:

SUBMARINE TELEGRAPH CABLE.

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDIOT BROTHERS,

No. 601 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

## SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDICT BROTHERS,

Agents for the American Waltham Watch,

601 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1888.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Rathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1888.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,

Office and Factory 86 Nassau Street,

New York City.

CHESTER, PARTRICK &amp; CO.,

TELEGRAPHIC &amp; ELECTRICAL ENGINEERS,

CONTRACTORS, &amp;c.,

38 SOUTH FIFTH STREET,

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closer.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &amp;c., &amp;c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &amp;c., &amp;c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

S. S. STAFFORD'S COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID* Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33¼ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

BISHOP'S PATENT

BALATA INSULATION

FOR TELEGRAPHY ELECTRIC WIRES.

We are now prepared to furnish wire insulated with this new and valuable material, which, from the time in which we have had to test its merits, proves to be

VERY TOUGH AND PLIABLE,

WILL NOT BECOME BRITTLE,

WILL NOT CRACK,

IS NOT EASILY AFFECTED BY EXPOSURE TO THE WEATHER,

AND

IS A PERFECT INSULATOR.

Any size or style of Wire made to order at short notice by the only manufacturers,

THE BISHOP GUTTA PERCHA COMPANY.

SAMUEL C. BISHOP, General Agent,  
113 Liberty street.

STICKWELL &amp; CO'S

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

What man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

*Stickwell's Mucilage is KING of the Market. No other brand sells as well.*

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 80Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	18 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for packing.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

**THE BROOKS**

PATENT PARAFFINE INSULATOR WORKS,

NO. 22 SOUTH TWENTY-FIRST STREET,

PHILADELPHIA

All varieties of INSULATORS manufactured at these Works are warranted to excel the usual style of Glass and Rubber more than one hundred fold. In view of the error and delay in transmission, waste and consumption of battery material, the results of defective insulation, its fragile nature and expense of renewal, nothing is more manifest than its economy.

To RAILROAD COMPANIES relying upon the efficiency of their telegraph departments it is of great value.

# JOURNAL OF THE TELEGRAPH.

## SUPPLEMENT.

### THE MACHINERY OF THE TELEGRAPH.

We have had frequent occasion to express our surprise at the constant and large demand for telegraphic machinery. Twenty years ago we tried in vain to induce manufacturers to finish a few sets in advance of their purchase, so as to be ready for immediate use whenever required. But no, there was no assurance that another would be needed, and the mechanics' file and foundry awaited a written order. One or two in Philadelphia, a single house in New York, and one in Utica, were the only places where a telegraph register could be seen, or men were engaged in making them. But times have changed. The rapid extension of lines has demanded an army of men to make its appliances. Wire factories were suddenly put into requisition to their utmost capacity, night and day, to supply orders from all parts of the country; and even now, when one would suppose telegraph lines had reached their limits, the demand continues, and several hundred men are employed in various cities turning out, with all the aids of systematized labor and adjusted machinery, fresh supplies for the ever-accumulating demand.

The Western Union Telegraph Company have large establishments located in Williamsburgh, N. Y., Louisville, Ky., and Ottawa, Ill., under superintendents of known skill, where immense numbers of magnets, keys, registers and all the paraphernalia of the telegraph are turned out to meet the wants of that Company, and yet there is a demand great and constant outside of that organization, which tasks the capacity of a dozen establishments to supply. Nothing so reveals the ceaseless activity of the nation as facts like these.

Among these establishments, and within the last year or two somewhat taking the lead in the distinctive articles for practical telegraphy, is the house of

**L. G. Tillotson & Co., No. 11 Dey Street, N. Y.,** which claims from us more than a passing notice.

In a recent mission for a friend in the South, we had occasion to visit the shops of Tillotson & Co., 137 and 139 Elm street, and embraced the opportunity to give the premises an editorial examination, presuming that it might be our duty to place the record thereof before our readers. A telegraph machine shop is a very interesting place to a telegrapher, and we presume we will be excused if we gab a little of what we saw.

We made a mistake in not taking the head of the house along with us. Mr. Tillotson is a sublime companion. We have often coveted his rotundity, his benign and jolly suavity—the *suaviter in modo* and *fortiter in re* which distinguishes him; but we found the foreman, Mr. W. H. Markland, fully equal to all we desired for our visit, and who very politely showed us the Tillotson establishment in all its detail of work. When we first entered the shop rooms about thirty men were very deeply engaged devouring their mid-day lunch, and this gave a very paternal character to the concern, as if Major Tillotson's thirty sons were enjoying the fruits of such honorable paternity. The rooms are large and commodious, and the men en-

gaged seemed to us like men of experience and skill. The system of retaining the services of good men, and making sacrifices and not unfrequently taking risks to keep them, has been pursued with admirable success. During the last winter this has been found not only a humane and generous arrangement, but has brought its proper fruits. Although at the opening of winter there were, as is usual at that season, no orders on hand to justify the retention of men, yet the whole force were retained through the entire winter on full pay. A large amount of machinery was thus accumulated upon the hands of the Company, but even before spring had set in every article thus made had been sold, and the wisdom of a generous regard for good men established and repaid.

We noticed one feature in the manufacture of machinery which has been too long neglected, perhaps because some have thought that it was against the interests of manufacturers to adopt. We refer to having all the parts of an instrument made by some distinct model, and so that every part made is a duplicate, complete and perfect, of the former. So here we were pleased to find that binding screws, armatures, cores, levers, posts, springs, keys and parts of keys, wheel trains and axles, the screws for the different parts, flys, stops, rollers, winding barrels and everything were made upon distinct models, and thus one machine made the duplicate of the other. The advantage of this must be obvious. When a part of an instrument has given out, the whole instrument has frequently had to be set aside or shipped to a great distance for repair. Many instruments have thus been lost. Now nothing is necessary but to order the duplicate of a certain part and at once the machine is complete as ever.

So of the different parts of the same part. The lathes are supplied with the drills of the exact depth required, and thus all is turned out with the exactitude of a watch. There is great economy of labor in all this, great opportunity for perfection, but the chief advantage is that of the absolute similarity of the parts and their applicability to any machine.

### The Quality of the Work.

After what we have said it seems scarcely necessary to say that the Tillotson manufactures are of the highest order. It could scarcely be otherwise. When a man has been set to make a distinct part, and been educated to it thoroughly, and made it for many years his only duty, he cannot avoid a perfection of work which miscellaneous labor would never produce. The machinery is massive, strong, of elegant forms, of excellent and convenient combinations, and, therefore, always acceptable. To this, far more than to even the urbanity of the principal, is the success of this house due. We have had occasion to admire its products, and two beautiful sets of machinery have recently been selected by Professor Morse from among them to present to two of our distinguished colleges.

### The Superintendent.

We missed the presence of the Superintendent of these works, Mr. E. M. Pierson, although Mr. Markland gave us ample opportunity to acquaint ourselves with all needed

details. Mr. Pierson, however, is well known to us as a very pleasant gentleman and ingenious workman. All the work of the establishment is, of course, under his care, and the management could not be in better hands. The arrangements to which we have alluded are his work, and the success of the establishment is greatly the result of his skill.

### Other Manufactures.

Besides the usual telegraph machinery, Tillotson & Co. turn out various electrical appliances, burglar alarms, dial telegraphs, Colgan and Jones switches, gas lighting apparatus, electro magnetic machines, and many other things connected with electric science. Here also our friend Callahan has his valuable Broker Telegraph instruments made, of which there are now over two hundred in use in the offices of our brokers.

**Bliss, Tillotson & Co., 171 South Clark Street, Chicago, Illinois.**

This is a branch of the New York house of Tillotson & Co., rendered absolutely necessary to meet Western demands. It is under the direction of Geo. H. Bliss, Esq., a gentleman of much worth and ability, and has already proved itself of great value to the West. All the goods sold there are supplied at Eastern prices, and a supply is always kept on hand to meet orders.

### Gutta Percha Goods.

Both of these houses are agents for the celebrated products of the house of S. C. Bishop, including cables of all kinds, the "Balata Insulation" now coming into general use, which can be exposed without injury and retains its qualities under all the tests of weather to which it has been exposed. The perfection of its insulating qualities must secure for it a large sale. The pole-cordage and office wire of the Bishop Company, and, indeed, all the telegraph appliances made by them are supplied by the houses of Tillotson & Co.

### American Compound Wire.

This article, the merits of which are not yet sufficiently known, is also supplied by this house. This wire is steel copper covered, and provides a conductor of half the weight with twice the conductivity of ordinary wire, a fact which must bring it into extensive use.

### The New York Sales Rooms, 11 Dey Street.

To parties visiting New York we refer them to these rooms with entire confidence in the honor of the house and the value of its products. There will be found also the products of many other manufacturers, and a large stock of railway supplies, which constitute an important feature of the business. These include all kinds of packing, rubber springs, Dudgeon's jacks, wrenches, rubber buckets, waste, hose, files, spikes, ties, head lights, steam gauges, lanterns, &c., &c. The principal of the house has long been identified with the telegraph, as well as the railroad, and few names are more familiar than his. We are gratified at his success, proud of his enterprise, and glad that he deserves the triumph which energy, and good sense, and good nature, a good partner, a first-class superintendent and faithful men have secured to his house. "Long may he wave." We now ask attention to the following advertisements.

## The Telegram.

Dead! did you say? he! dead in his prime!  
Son of my mother! my brother! my friend!  
While the horologe points to the noon of his time,  
Has his sun set in darkness? is all at an end?  
("By a sudden accident.")

Dead! it is not, it cannot, it must not be true!  
Let me read the dire words for myself, if I can;  
Relentless, hard, cold, they rise on my view—  
They blind me! how did you say that they ran?  
("He was mortally injured.")

Dead! around me I hear the singing of birds  
And the breath of June roses comes in at the pane;  
Nothing—nothing is changed by those terrible words;  
They cannot be true! let me see them again!  
("And died yesterday.")

Dead! a letter but yesterday told of his love!  
Another to-morrow the tale will repeat;  
Outstripped by this thunderbolt flung from above,  
Scathing my heart, as it falls at my feet!  
("Funeral to-morrow.")

Oh, terrible Telegraph! subtle and still!  
Darting thy lightnings with pitiless haste!  
No kind warning thunder—no storm-boding thrill—  
But one fierce deadly flash, and the heart lieth waste!  
("Inform his friends.")

SARAH E. HENSHAW, in *March Galaxy*.

## The Tools of Great Workmen.

It is not tools that make the workman, but the trained skill and perseverance of the man himself. Indeed, it is proverbial that bad workmen never yet had good tools. A student once asked a great artist by what wonderful process he mixed his colors. "I mix them with my brains, sir," was his reply. It is the same with every workman who would excel. Ferguson made a wonderful thing—his wooden clock, that accurately measured the hours—by means of a common penknife, a tool in everybody's hand, but then everybody is not a Ferguson. A pan of water and two thermometers were the tools by which Dr. Black discovered latent heat. A prism, a lens, and a sheet of pasteboard enabled Newton to unfold the composition of light and the origin of color. An eminent foreign *savant* once called upon Dr. Wollaston, and requested to be shown over the laboratories in which science had been enriched by so many important discoveries. The doctor took him into a little studio, and, pointing to an old tea-tray on the table, containing a few watch-glasses, test-papers, a small balance, a blow-pipe, he said: "There is all the laboratory I have." Stothard learned the art of combining colors by closely studying butterflies' wings. He would often say that no one knew how much he owed to those tiny insects. A burnt stick and a barn door served Wilkie in lieu of pencil and canvas. Bewick first practiced drawing on the cottage walls of his native village, which he covered with his sketches in chalk; and Benjamin West made his first brushes out of a cat's tail. Ferguson laid himself down in the fields at night in a blanket and made a map of the heavenly bodies by means of a thread with small beads on it, stretched between his eyes and the stars. Franklin first robbed the thunder-cloud of its light-

ning by means of a kite made with two cross-sticks and a silk handkerchief. Watt made his first model of the condensing steam engine out of an old anatomist's syringe, used to inject the arteries previous to dissection. Gifford worked his first problem in mathematics, when he was a cobbler's apprentice, upon small scraps of leather, which he beat smooth for the purpose; while Rittenhouse, the astronomer, first calculated the eclipses on his plow handles.—*American Artizan*.

## Sounds of Telegraph Wires.

As the cause of the sounds frequently heard to proceed from the wires in the open air, it has been customary to accept the wind, and its producing the soundings by direct vibration, similar to those of the Æolian harp. A different view of it, however, and one which will recommend itself perhaps more generally, is given by a railroad officer in the *Austrian Railway Gazette*.

He calls observation to the fact that one who gives his close attention to both the wires and sounds will find that the latter make their appearance likewise when there is a total absence of wind; and in a quiet morning in winter, when the wires appear covered with frost to the thickness of a finger, they nevertheless carried on lively vibrations and swinging while the air was totally quiet. The observer had noticed this for eighteen years past, and at last was led to the real cause of the phenomenon.

According to him, therefore, the vibrations are not due to the wind, but to the changes of atmospheric temperature, and especially through the action of cold, as lowering of the temperature induces a shortening of the wires, extending over the whole length of the conductor. A considerable amount of friction is produced on the supporting bells, and this gives the explanation for the sounding both in the wires and the poles. This explanation also concurs with the fact that poles bearing but one or a few wires give off far louder sounds than when loaded with many, because in the latter case the vibrations produced must be less uniform and simultaneous.

## Interesting Experiment in Electricity.

The *Boston Journal of Chemistry* gives the following amusing and instructive experiment: "Procure four glass tumblers or common glazed teacups, and having wiped them dry as possible, hold them over the fire to evaporate any moisture which may still adhere to their surface; for if there is the least moisture it makes a connection and spoils the experiment. Place them upon the floor in a square, about one foot apart; place a piece of board upon the tumblers, and have a person standing upon the board. This person is now completely insulated, the glass being a non-conductor of electricity. Now take a common rubber comb, and having wound a piece of silk around one end of it, rub it briskly through your hair, and draw the teeth parallel to the insulated person's knuckles, leaving a little space between the comb and the person's hand. The result will be a sharp, crackling noise, and if dark, there will be seen a succession of sparks. Re-

peat the process until the phenomena cease. The person is now "charged" with electricity, the same as a Leyden jar. To draw off the electricity, approach your knuckles to the person's hands or his nose (being careful not to allow any portion of your body to come in contact with his), and there will be a loud snap and the sparks will be very brilliant. If a cat be held so that the charged person can place his knuckles in proximity with the animal's nose, it will suddenly appear as if it were in contact with an electric battery. A glass bottle may be used in lieu of the comb, but it is not so well adapted for the purpose. Much amusement may be derived from this extremely simple experiment, and some of our numerous young readers will hasten to try it for themselves."

### The Coast Survey Experiments.

Boston, March 22, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

Although several articles have been published in relation to the recent experiments by the United States Coast Survey for the purpose of establishing the longitude of a point on the Pacific coast, I propose to offer a brief communication on the subject, confining myself more especially to a description of the instruments used at Cambridge, similar instruments for the purpose having probably been used at San Francisco.

The Chronograph, by which the measurements of time are recorded, consists of a cylinder carried by clock-work, and which makes exactly one revolution per minute. This cylinder is thirteen and a half inches in length and about six inches in diameter. Its surface is covered by a sheet of plain white paper of the proper dimensions, and above which is placed an electro magnet, with a pen attached to its armature, and resting upon the paper. When the cylinder rotates, the circuit in which the electro magnet is placed, being closed and undisturbed, a smooth ink line is marked upon the paper, which of course, with each revolution of the cylinder, represents one minute, and is twenty inches in length; but as each succeeding minute line would be marked directly over the preceding, if not prevented from so doing, the mechanism is so arranged as to gradually move the electro magnet, with its pen-armature attachment, on a slide (placed lengthwise with the cylinder) at the rate of one-twelfth of an inch per minute, thus causing the pen to mark a continuous spiral line, each of which extending around the cylinder, being one-twelfth of an inch from the preceding.

During the revolutions of the cylinder, the seconds are marked by a short break in the circuit, produced at each vibration of the clock pendulum, which break causes the pen to diverge slightly at the instant, and thereby marking a short loop in the minute line. The seconds thus recorded are separated one-third of an inch, and of course any intervening break marks the fractional part of the second in the same manner,

this fraction being measurable to the one-hundredth part of a second.

On the night of the exchange of clock signals between distant points, by means of telegraphic communication, the error of each clock is ascertained by independent observations, something after the following method :

Placed in the focus of the object glass of the Cambridge telescope are twenty-five spiders' lines, in groups of five. During the observations the electro magnet attached to the chronograph is connected with the observer's key, in a local circuit, the clock pendulum recording the seconds regularly as the cylinder revolves. At the instant a star, which is being observed, passes each of the spiders' lines, the observer breaks circuit for an instant, which break is faithfully recorded by the pen marking the seconds.

After a number of stars have been observed in their passage over these lines, and the time of each recorded, the mean of the observations are taken to ascertain the error of the clock.

The exact time at each point being known, by means of these independent observations, the next and more difficult feature of the experiments is to ascertain, by comparison of results, the differences in time, and thereby enable the observers to compute the number of degrees distant, East or West, from Cambridge. When the telegraph has not been brought into requisition, this has sometimes been done by transportation of twenty or thirty chronometers, some of which will lose time and others gain on the passage, a mean of the whole being taken for a result.

The telegraph is not able to make an absolutely perfect comparison on account of the time required for transmission and armature movements, but it is able to make them more nearly perfect than any other system, because these errors are comparatively slight, and are, in fact, eliminated by an exchange of clock signals between the two points (and comparison of results), except for the unknown differences in the adjustments of relays and repeaters, between the two directions of transmission. If using several repeaters between the distant points, of course this unknown error is augmented. During the recent comparisons between Cambridge and San Francisco seven circuits of about five hundred miles each were combined by means of six repeaters; consequently, the direct results of the clock comparisons contained the unknown error of the difference in time required for the successive movements of the several relay and repeater armatures between the two directions of transmission. The greatest liability to error occurs in the movement of the repeater armatures, from the fact that in the automatic repeater the armature breaking the next circuit in order, has necessarily some considerable distance to move before the main circuit is broken, and this loss of time varies in different repeaters, or on opposite sides of the same repeater, it being dependent to a great extent upon the adjustment of the spring, which follows the armature a short distance before contact is broken.

After the exchange of clock signals between San Francisco and Cambridge, for the purpose of ascertaining the longitude of the former, it was proposed to experiment, for scientific purposes, upon transmission time, by the employment of two complete lines between these points, the lines to be doubled by a repeater at Boston, and to comprise fourteen circuits of about five hundred miles each, combined by thirteen repeaters. This was successfully accomplished on the nights of February 27th and March 6th. Signals were sent from San Francisco through Cambridge, and returned to San Francisco, after which the Western wires were doubled at Buffalo for the same purpose, and so on to Virginia City, doubling the Western wires at each point where repeaters were in use.

As soon as San Francisco had completed the experiment via Cambridge, the two lines between Buffalo and Cambridge were doubled at Buffalo, and Cambridge sent signals to Buffalo and return, afterwards sending to Chicago and return, and following on to San Francisco. By means of an arrangement of wire and clock connections, made by Prof. Winlock, Director of Harvard Observatory, the chronographic record of both the sending and returning time of each signal was made upon the same minute line, by the same electro magnet and pen. Thus the fractional part of a second between the two was readily measured, the result being as follows :

#### TIME OF TRANSMISSION FROM CAMBRIDGE.

	Hundredths of second.	
To Buffalo and return.....	10.....	1 Repeater.
" Chicago and return.....	20.....	3 Repeaters.
" To Omaha and return.....	33.....	5 "
" Salt Lake and return.....	54.....	7 "
" To Virginia City and return.....	70.....	11 "
" San Francisco and return.....	74.....	13 "

Prof. Winlock has suggested another method of measuring transmission time, with no repeaters in line, viz : To receive a clock signal at Cambridge from the greatest distance possible on a single circuit, this signal to release a pendulum at Cambridge, which, after a given time, returns a signal to the first point. The sending and receiving time of these signals being accurately recorded at each point, a comparison will give the desired result. Prof. W. is at present experimenting with this method, and I hope to be able to send you interesting results at a future time. M.

#### How Longitude is Obtained.

For the information of that portion of our readers who are not versed in the question of "Longitude," we propose to explain briefly the meaning of the term, and how the longitude of any required place on the earth's surface may be found. This is done so well by the *Chicago Tribune* that we copy from it *verbatim*.

The longitude of a place is the angular distance east or west from any other place selected as the standard; the distance is measured on the equator, or parallel to that circle. If we suppose a great circle of the sphere to pass through any place, and also through both poles, that circle is the meridian of the place. The difference of longitude of any two places may, therefore, be otherwise indicated as the distance between the two meridians of those places.

In England, the Observatory at Greenwich is the place chosen as that from which the longitude of other places is reckoned. In the United States, the Washington Observatory is usually understood as being on the first meridian.

The rotation of the earth brings every part of the equatorial circle under the sun once each day. The 360 degrees of the circle are thus brought round in twenty-four hours, or 16 degrees per hour—each degree, therefore, occupying four minutes of time in passing under the sun. That is, there is a difference of four minutes in the actual time of noon between two places which differ one degree in longitude.

The process of finding the longitude is also very simple in theory, consisting only in finding the difference in the time of noon between the two meridians. In practice, however, it is a complicated operation; the leading difficulty met with lying in the fact that it is impossible to construct a time-piece which can be depended on to preserve exactly the same "rate of going" while being carried from one place to another.

Hence some other plan than that of transporting clocks has necessarily to be resorted to. The one most in use is the observation of the eclipses of Jupiter's moons.

The satellites of Jupiter revolve around him in orbits, but little inclined to the plane of the ecliptic. Hence they pass before and behind the planet at each revolution. The times at which these satellites appear to be in contact with the edge of the planet, being calculated for the meridian of Greenwich, an observation at any other place will give the difference of time between the two places. Thus : The first satellite emerged from the bottom of the planet at 4 hours 51 minutes 6 seconds past midnight, at Greenwich, on the morning of March 4th, 1869. If it had been possible to view the emersion at Chicago, it would have been found to take place at 11 hours and 46 seconds past noon on the 3d instant, showing that Chicago is 5 hours 50 minutes 20 seconds, or 87 degrees 35 minutes, west of Greenwich.

These observations involve the necessity of also finding the instant when the sun crosses the meridian of the place whose longitude is to be ascertained, and the opportunity of doing this may not occur for several days before or after the observation of the satellite, owing to cloudy weather. During this time the clock may vary several seconds from the true rate of going, and the longitude, as deduced by this process, will be to that extent erroneous.

Since the introduction of the electric-telegraph, the "wires" have been extensively employed in comparing the time at different places. The passage of the electric fluid over the wires is practically instantaneous, being about 16,000 miles per second, so that all required is good apparatus for observing and comparing. The following will give an idea of the process :

Cambridge Observatory is selected as the point the longitude of which is known, and San Francisco is the place the longitude of which is to be determined. The two places are connected by telegraph, and a comparison made between the clocks of the two stations by striking the signal key at San Francisco simultaneously with the beats of the clock there, the beat being recorded on a register, which records, also, the instants of the Cambridge clock beats. The clocks are thus compared, to a small fraction of a second; the current is then turned the other way, and the Cambridge clock beats are recorded on a register at San Francisco. A comparison of the two sets of observations will enable the operators to correct any difference due to the time lost in the transmission of the signals. The clocks being thus compared, a number of stars, previously selected, are observed at each place. The instant that the star crosses the spider thread drawn across the Cambridge telescope, to mark the line of due South, is recorded on the registers at both ends of the line, and when, a few hours afterwards, the same star is seen to cross the meridian of San Francisco, the instant is recorded on the revolving register there, and the telegraph wire pulsates the intelligence to Cambridge, where it is likewise recorded. These observations, being repeated many times, and the average of all the observations taken, enable the operators to determine within the one-hundredth part of a second, the difference of longitude between the two places. The approximate difference is 3 hours 25 minutes 8 seconds and nine-tenths of a second, or 51 degrees, 17 1/2 minutes.

AN eccentric English lady, who imagined herself the destined bride of Christ, recently died, and the furniture of her residence, which was fitted up in accordance with her insane idea, is to be sold. In the drawing-room is a large and costly arm chair, the judgment seat. The room is divided by a curtain from the bridal bedchamber intended for our Lord. The bed alone cost £1,000, and the furniture of the two rooms not less than £25,000.

## The British Government Telegraphs.

[From the Edinburgh Review.]

In February, 1868, Mr. Scudamore presented to the Postmaster-General a supplementary report, answering certain objections which had been urged against the scheme, and going further into particulars. This report, like the former one, concludes with an estimate of the amount required for the purchase, and of the annual receipts and expenses. Considering the value of the companies to be indicated by the market price of their shares, the estimate for purchase is raised to £3,000,000; and adding £100,000 for works to be erected by the Post Office, it makes the total capital outlay £3,100,000, equivalent to a yearly charge of £100,000. The annual receipts are estimated at £640,000, as before; but £32,000 are deducted for possible excess, leaving the gross revenue at £608,000, while, to the annual charge for capital, £5,000 is added for possible excesses; so that, deducting £105,000 from £608,000, £503,000 is left to meet working expenses, which are now estimated at £405,000, plus, for possible excess, £20,250; subtracting, therefore, £425,250 from £503,000, a surplus revenue of £77,750 is the result.

Early in last session a bill was introduced into the House of Commons for the purpose of enabling Government to purchase the telegraphs and undertake the duties hitherto performed by the companies. The bill, as it has passed into law, substantially carries into effect the scheme of working described above, establishing a uniform rate, not exceeding one shilling for a telegram of twenty words, with an extra three-pence for every additional five words (exclusive of names and address)—these charges are to cover the cost of a messenger within one mile of the terminal telegraph office, or within the limit of the postal delivery when the latter office is a head post-office—with an additional charge of sixpence per double mile when the addressee resides beyond those limits, unless, indeed, the sender objects to incur the expense of a special messenger, in which case the telegram is to be delivered with the post letters. Government retains the power (conferred on it by the various Telegraph Companies' Acts of Parliament) of having its important messages forwarded at once, in priority to those of the public; but, to guard against the abuse of this privilege, every such message is to be stamped "Priority," and is to be preserved for twelve months by the Postmaster-General. The bill, as originally introduced, made provision for the purchase of the interests of the telegraph companies on the terms indicated in Mr. Scudamore's report of February, 1868; but petitions were presented against it by the various telegraph companies, and also by such railway companies as made a profit by sending telegrams along their wires.

After much delay, caused by the political business before the House, the bill was referred to a select committee, which, choosing the Chancellor of the Exchequer (Mr. Ward Hunt) for its chairman, began its sittings on 1st July, and heard counsel and witnesses for and against the measure. Before the committee had proceeded far in its inquiry, negotiations took place between the government authorities and the opponents of the measure; and ultimately terms were agreed upon, in consequence of which all the petitioners withdrew their opposition, so that the inquiry was deprived of the sifting investigation secured by the contention of two heartily opposed parties. As Mr. Goschen well remarked, the witnesses and counsel were all on one side.

Indeed, owing to so short a portion of the session remaining after the inquiry began, a thorough investigation was impossible; and the committee, as observed by Mr. Childers in the debate on the third reading of the bill, was necessarily compelled to rely

almost entirely on the government officials. Mr. Childers protested strongly against the haste with which the inquiry had been conducted, seeing that such important interests and so large a sum of public money were involved; and when the effect of the provisions of the bill as it passed into an Act are understood, it will be admitted that he had good grounds for his protest. We allude especially to the clauses relating to purchase of the interests of telegraph and railway companies.\* The real drift of these arrangements is not discovered without more examination and thought than it was perhaps possible for the hurried committee to devote to it; but enough appears even on the face of the evidence given before them, to justify considerable apprehension and require further deliberation.

As has been shown, the original estimate of 1866 calculated the aggregate purchase-money required at £2,400,000, which was increased in February, 1868, to £3,000,000; but, in his evidence before the committee, Mr. Scudamore stated the amount then required to be £6,000,000, and would not pledge himself that it might not exceed £7,000,000. Indeed, the lowest amount of which he could speak quite certainly as being beyond the mark was £8,000,000. It is true that the original estimate includes only the property and rights of the telegraph companies, while the later one comprises the buying up of the interests of the railway companies in public telegraphing, and also some cables across the narrow seas; but the cost of these additional articles ought not to be very large. When, however, the terms laid down in the Act and the confirmed agreements are examined, it is not difficult to explain the great advance of the estimate. Government seems to have dealt with the petitioners against their bill pretty much as an anxious traveler in danger of losing his steam-packet deals with a boatman—paying whatever is asked. In their eagerness not to quit office without leaving a permanent memento, they passed a reform bill which went far beyond Mr. Gladstone's measure, denounced by them as revolutionary; and rather than leave the credit and patronage arising from the adoption of the telegraphs to their successors, they have given way to every demand, however preposterous and extortionate. As far as one can judge from the terms conceded, the companies' proposals must have been accepted without examination. Obviously many of the provisions have been inserted merely with the notion that they could do the proposers no harm, since they could be struck out, while, by some extraordinary oversight on the part of the government, they might possibly be conceded; and which ever company was least restrained by modesty appears to have obtained the most extravagant bargain—which, indeed, is sufficiently proved by the very great diversity of the terms contained in the different agreements.

On examining these conditions granted to the telegraph companies, we find that each of them is to receive twenty years' purchase of its net profits, to be estimated on the year or half-year ending 10th June last, an unfortunate period for the buyer, inasmuch as the companies' accounts were not then published to that date, so that an opening was left for so arranging the figures as to swell apparent profits. But even supposing that the annual profits will be fairly taken, twenty years' purchase of them would be an excessive price.

The interest of a telegraph company partakes of the nature of a *trade*, rather than that of an estate, the value of the concern being as much in good-will as in

\* As to the four principal telegraph, and sixteen of the railway companies, the terms of purchase—or rather upon which arbitrations are to be based—are inserted in the Act; but with regard to the remaining railway and telegraph companies, agreements made between them and government are simply referred to and confirmed. The agreements are printed at length in Appendix No. 6 to the report.

tangible property; for, although the older companies have been paying ten per cent. dividend, their shares did not, until the purchase by Government was proposed, stand at more than 45 per cent. premium. But this is by no means all. In addition to twenty years' purchase of its profits, the United Kingdom Company is to receive, first, the price paid by the company for the purchase of Hughes' type-printing telegraph; secondly, a sum equal to the aggregate value of the share capital of the company, estimated at the highest quotation shown in the official list of the London Stock Exchange on any day between the 1st and 25th of June, 1868; and thirdly, compensation for the loss of the prospective profits of the ordinary shares, and any sum that may be determined on in consideration of the efforts to establish a uniform shilling rate for the conveyance of telegraphic messages.

Now, we have heard of a cabman charging an inexperienced foreigner for the mileage which he had traversed, and also for the time occupied in the transit; but, in comparison with this company, the cab exaction falls within the bounds of moderation. First, they sell their concern for twenty years' purchase of the actual profits, then they are paid the cost of a portion of the plant employed in obtaining those profits; further, they are paid the full market price of the shares even when swollen by the intended purchase by Government; and lastly, they are to receive compensation for prospective profits, and a sum (which may be great or little according to the discretion of the arbitrator) in reward of services which in past time they had *endeavored* to render to the public, for as a matter of fact they did not succeed in establishing the uniform shilling rate. This looks very much like buying them up *four times over*. Reuter's company, also, in addition to the twenty years' profits, is to receive twenty years' purchase of the *probable profits* to be derived by the company from its contract with the Indo-European Electric Telegraph Company. The London and Provincial Telegraph Company is to have, in addition to twenty years' profits, "the highest market quotation of the ordinary shares between 1st June and 8th July, 1868, together with what an arbitrator shall give in respect of the prospective profits of the Company," and thirdly, compensation to officers and clerks—a provision which is indeed inserted in the other agreements, though it might be supposed that, with such enormous terms, the companies could take this burden on themselves, but as perhaps most of these officers will be taken into the Post-Office service, this liability may not turn out to be very serious.

The statements must appear to our readers quite incredible; we trust, therefore, that such of them as have the opportunity will refer to the documents quoted.

If an additional proof is needed of the extravagance of the terms conceded to the telegraph companies, it is supplied by the rise in the market price of their shares, bearing in mind, also, that it is not certain that these bargains are irrevocable; that is, that Parliament is bound in honor to maintain them, a subject which will be considered in a later part of the article. Thus we find that the shares of the Electric and International Telegraph Company which fluctuated in 1866 and 1867 between 133 and 145, are now worth from 235 to 240, having risen between June 23d and July 23d from 165 to 206. The British and Irish Magnetic Company's shares are now quoted at 165-170, having stood in 1866 at from 78-90, and in 1867, 90-97. From the exorbitant terms it obtained, it may be supposed that the United Kingdom Company will have derived the greatest advantage; and, in fact, it seems that their shares (£5 paid), which in 1867 varied between 1½

1½, are now selling at from 5½ to 6—a fourfold increase in value.

#### BEAUTIFUL VARIETY.

The terms of arrangement with the railroad companies are even more ill considered and mischievous than those with the telegraph companies; and here it is most obvious that any stipulation was admitted which the ingenuity of the company's agent could conceive. The diversity is still greater. Indeed, it would seem that the negotiators looked at the matter from an artistic point of view, considering variety as a beauty. Not only do the contracts differ very greatly in substance, even when in effect the same, but their language is varied.

#### TERMS OF COMPENSATION.

First, as to the terms of compensation. Most of the companies have bargained to receive twenty years' purchase of the net profits made by conveying telegraphic messages for the public, though in the statute this is expressed "net annual receipts;" the London and South-Western and North-Eastern Railways have, however, no such stipulation, but merely a general provision for compensation, to be settled by arbitration. In some instances the annual amount of these profits is fixed, subject to verification, at specific amounts, while the North British railway company is to have twenty years' purchase of the present value of its "trade receipts," and the Caledonian railway has bargained for twenty years' purchase "of the amount of the whole receipts drawn by the railway company for the transmission of telegraph messages, reckoned on the basis of the receipts for the week ending 12th June, 1868," limited to £1,200 per annum; while the Bristol and Exeter railway is to have twenty years' purchase of its whole receipts of public telegraphic messages, without any limitation.

#### WHAT THE RAILROADS GET.

In addition to the foregoing, all the railway companies, except the London and South-Western and North-Eastern, are to receive twenty years' purchase of the estimated annual increase of their net profits; though in the case of the British and Exeter railway, this is to be on the increase of the whole receipts. All the companies have stipulated for compensation for the relinquishment of the right to grant way-leaves for the erection of telegraphs; and all, save the London, Chatham, and Dover company, are to be compensated for the loss of the reversion of the telegraphs and of the right of granting way-leaves on the expiration of the telegraph companies' terms of agreement. The Great Western, the London, Chatham, and Dover, the Bristol and Exeter, and the Caledonian railway companies have stipulated that the Government shall make good the rents payable to them by the telegraph companies during the unexpired periods of their agreements.

#### ALL GET WHAT THEY ASK.

It will be seen, therefore, that the pecuniary compensation to be paid to the respective companies is based on very diversified principles, some having driven far harder bargains than others, and having, indeed, evidently obtained whatever they chose to ask for. When we turn to the other stipulations, we find an equal diversity, and much that is highly objectionable. Thus, all the railways, save the Caledonian, are empowered to shift the poles and wires at the Postmaster-General's expense whenever their own works require it, while the Caledonian is bound to give notice to the Postmaster-General, who will shift them at the cost of the company. In some instances it is specially provided that Government is to have an exclusive right of way for its poles and wires, while in other cases this is left to inference. Generally, but not always, the company is to receive, in addition to the other emoluments, rent for the standing of the poles and wires. Several other stipulations seem very un-

favorable to Government; as that it is to hand over in good repair to the railway company such of the poles and wires of the telegraph companies as have hitherto been used for railway purposes, and that these are to become the absolute property of the railway company, &c.

#### THE FRANKING PRIVILEGE.

It is needless to weary the reader by enumerating all the variations in these agreements; suffice it to say that they are very numerous, both in substance and in form. But one provision is particularly mischievous. Except the South-Eastern and the North-British, all the railway companies, and also the Grand Junction Canal and the Bridgewater Canal Trustees, are to have the right to frank by telegraph to all parts of the kingdom. In the statute the privilege is expressed as regards the railways to be to and from all "foreign stations" (whatever that may mean, for the word, though placed between inverted commas in the Act is not interpreted), while the canals are to frank to and from "any places in the United Kingdom," and the confirmed agreements generally confer the right to frank to and from all parts of the United Kingdom. The abuses caused by the old system of franking are well known, and it is much to be feared that they will now be reproduced in an aggravated form; for, although the franking of letters undoubtedly tended to injure the revenue by diminishing chargeable correspondence, it did not appreciably enhance the expenses of the department; for neither mileage of mails nor beats of letter-carriers increased with the number of letters conveyed. Not so with telegraphs, most of which are sent out by special messengers, and thus cause a certain expense. The loose manner in which the provisions are worded, too, may place the Post Office in a very awkward position; thus the Act provides that "the Postmaster-General shall also transmit to their respective destinations all messages of the said trustees, and of the Earl of Ellesmere respectively, and their respective agents and clerks *bona fide* relating to the business of the said trust and undertaking, between any places in the United Kingdom free of charges;" and the same privilege is granted to the Grand Junction Canal Company. The corresponding stipulation in most of the confirmed agreements is equally stringent. It is clear, therefore, that the franking privilege is not confined to places to which the public can telegraph without paying for a special messenger, but that the companies may force the Post Office to send their telegrams gratis to any spot, however distant from a telegraph office. It is impossible to distinguish whether or not a message is on the business of the company; consequently this stipulation must lead to endless disputes, if not to fraud. That such a provision could have been allowed to pass shows with what reckless haste the business has been managed.\*

#### AS BAD AS CAN BE CONCEIVED.

Indeed, the mode adopted of determining the compensation is as bad as can be conceived. Either a definite sum, to include every thing, should have been fixed on each case, or the whole matter should have been referred to arbitration. Had the former case been taken, Parliament would have seen its way, and sums obviously in excess of what was reasonable could not have been allowed to pass; while, on the other hand, had the whole question been left to arbitration, the *pros* and *cons* might have been fairly brought before the arbitrator, and a reasonable determination might have been expected. But under the insidious details of these agreements it is impossible

\*Indeed, under the words of the Statute and agreements, the whole correspondence of these bodies (both to and from them) may be conducted by franked telegram, and, considering the convenience and costlessness (to the parties) of the process, no doubt a great portion of it will be so conducted.

to form an idea of what may be awarded; though it is certain that it will be something very large. Indeed, it is well known that the officers of the railway and telegraph companies are jubilant about the terms they have obtained.

No doubt the honor and the true interests of the country require the Government should deal fairly, and even liberally, with parties whose rights it is acquiring for public purposes, and we freely admit that the sellers were entitled to receive the full value of their property and something more—the transaction ought to have been decidedly beneficial to them; but that double, or even more than double, the value of their concern should be paid to the parties, is a gross and profligate waste of the national funds.

#### NOTHING DEFINED.

A prominent feature of all the agreements is that nothing is accurately defined, all being left open to arrangement; and failing that, to arbitration—not only in settling the compensation for the properties acquired, but in the yearly transactions with the railway companies along whose lines the telegraphs pass. This must infallibly lead to frequent disputes, and will place the officers of Government under a serious temptation, to which, although they may prove superior, they ought not to be subjected. Even if the receipts from telegrams should be so great as, after paying working expenses, to cover the annual charge occasioned by the original outlay, that would be no justification of its extravagance. Recollecting that it is agreed on all hands that the system must be self-supporting, the reduction of the minimum charge for a telegram from the high rate of 1s. (two and a half fold what is paid in Belgium) must depend upon the profits to be derived; and on this head the estimate laid before Parliament seems to us to be of a very sanguine character.

#### BELGIUM ONCE MORE.

Mr. Scudamore calculates that the post office will convey 11,200,000 telegrams per annum at a minimum rate of 1s., i. e. where the communication does not exceed twenty words in length, and no charge for a special messenger is made. In Belgium, where the rate is only 50 centimes (4½d.), and where a low uniform charge has been for some years in existence, the number of telegrams was in 1866 (according to a table published in the appendix to the report) 1,128,005 only. Now Belgium has a population of about 5,000,000, or one-sixth of that of the United Kingdom, and it stands next to this country in manufacturing and commercial energy, while, on the other hand, postage is higher than here, being twenty centimes (2d.) for distances exceeding nineteen miles. It is obvious that a 4½d. telegram rate can compete against a 2d. postage at much greater advantage than a shilling rate can compete against a penny postage. Yet the inhabitants of the United Kingdom are expected to send twice as many telegrams per head as in Belgium.

The calculation of annual outgoings is based upon the expenditure of the companies; and supposing that Government can work as economically as those bodies, it does not seem to be unduly low, save that only £26,000 is allowed for the cost of working the new extensions to be made by the Post Office. And as the present telegraph stations do not much exceed 2,000, and there are 3,000 money-order offices—each of which is to be connected with the wires, although many of them are at great distances from existing telegraphs—this seems to be a very small allowance for the maintenance of poles, wires, and instruments of these extensions, and the cost of the clerks and messengers employed upon them, even allowing that much of the work can be done by the existing postal staff.

The Post Office has a monopoly of the conveyance of letters, but the Act of last session accords to it no monopoly of telegraphic business. Mr. Scudamore argues that it is well that the Department should be subjected to the possibility of competition, so that it may not become careless and unwilling to adopt improvements. And, indeed, if it were probable that a sixpenny rate could be introduced at an early period, there would be little fear that the revenue would be injured by competition so long as the public was fairly well served. But, with a shilling rate, this is by no means clear. In some of the principal cities there are already local sixpenny telegraphs—in these cases the charges will be increased by the proposed measure—and it is by no means improbable that between large towns a successful competition may be maintained. The cost of erecting a telegraph is from £25 to £30 per mile, so that a hundred miles may be established for £3,000; and although Government seems to have bargained for an exclusive right of way over the railways, there is nothing to prevent the erection of telegraphs over canals, roads, or private property. Now the Act provides that the rate shall always be uniform; thus the Post Office could not drop the charge in particular districts to meet competition. It appears that Mr. Goschen was so struck with the danger of serious injury to the revenue by competition, that in the Select Committee he proposed a modification of the Report, recommending that Government should have a monopoly of telegraphic communication. Possibly, indeed, this competition may become so serious as to compel the adoption of a rate so low (unless Parliament should sanction the abandonment of the principle of uniformity) as to occasion a loss to the revenue; and thus the telegraphs may become a serious burden on the State; though, on the other hand, were the system loaded only with a reasonable outlay for purchase, there can be no doubt but that, ere long, the great benefit of a universal sixpenny rate might, without loss, have been conferred upon the public.

#### POST OFFICE CANNOT BE TRUSTED.

In order that the real financial results of the measure may be seen, it is most important that the expenditures and receipts of the telegraphic system be kept perfectly distinct in the accounts of the Department. As regards the receipts, this object may be easily attained by providing special stamps for telegrams; but much care and watchfulness will be needed to prevent expenses properly belonging to telegraphs from being mixed up with those of the letter service. It is to be hoped also that the work of constructing and maintaining telegraphs (where this is not done by railway companies) will be let to contractors. If the post office attempts to manage these operations itself, they must prove very costly.

Among the many proofs of haste in the concoction and carriage of the measure, is that the statute confers no compulsory powers on the Post Office of laying its poles and wires along high roads and canals, or over private land. Subject, of course, to proper liability to compensate, the creation of such a right would be perfectly just, and very advantageous to the Department when it makes the intended extensions into the districts to be newly accommodated; the want of this power, indeed, may enable road trustees and others to exact very high prices.

It will be observed that the charge for a telegram is the same, whether it is to be delivered by special messenger or by the letter-carrier with the post-letters. Now, considering that with a short telegram (not exceeding twenty words) the cost must be mainly in the special messenger, one to be delivered by the letter-carrier might have been admitted at a lower rate, seeing that penny letters are thus con-

veyed to their destination; in many cases, where the addressee resides within the limits wherein no extra charge is to be made for a special messenger, delivery by post would answer the sender's purpose. In all the large towns there are several deliveries of letters daily. A telegram, therefore, sent from one of these towns to another in the morning or forenoon would reach its addressee by postal delivery in ample time to enable a business transaction to be effected the same day and an answer to be returned by the evening post. Telegrams, also, sent early in the day to very distant places—as from London to the north of Scotland or to Ireland—would, although delivered by the ordinary letter-carrier, arrive a day earlier than if sent by post; and the same would be the case as regards telegrams dispatched, after the departure of the night letters, to one of the numerous districts which have no connection with the day mails. Clearly, therefore, such telegrams ought to be conveyed at a reduced charge, say sixpence or eightpence. Again, as one shilling is to be charged for a telegram of twenty words (exclusive of names and addresses), it does not seem just to exact so high a payment as threepence for every additional five words of the text, seeing that the delivery and other processes are the same, whatever may be the length of the message.

In an earlier part of this article the question whether public faith requires that Parliament should carry into effect the purchases and compensations sanctioned by this Act, has been alluded to. Both Mr. Gladstone and Mr. Goschen, as appears by their speeches on the third reading of the bill, are of opinion that the Legislature may still without unfairness refuse to vote the requisite funds, and thus reopen the whole subject. And it must be owing to this consideration that the telegraph companies' shares have not risen much more in value than has been the case. The last section of the Act provides that,

"In case no Act shall be passed during this or next session of Parliament, putting at the disposal of the Postmaster General such moneys as shall be requisite for carrying into effect the objects and purposes of this Act, the provisions contained in this Act, or in the agreements hereby confirmed, relating to the arrangements with railway and telegraph companies, and all proceedings thereunder, shall become void; and the Postmaster General shall thereupon pay the several companies mentioned in such clauses and agreements all reasonable costs and expenses, if any, properly incurred by them respectively in any relation to any proceedings taken under this Act."

The present Parliament will therefore have to consider whether it will vote the funds required to carry into effect the rash engagements of its predecessor; and the present Government will have to determine how far it is morally bound to adopt the terms of agreement which were accepted by the late ministry and sanctioned by the legislature. The question is one of great nicety and moment, and we commend it to the special attention of the Chancellor of the Exchequer, the Postmaster General, and the President of the Board of Trade.

#### A Promising Applicant.

Here is a sweet specimen of an enterprising youth who wishes to aid the development of the great West. Let him speak.

LACEYVILLE, March 22th, 1868.

American Telegraph Co., N. Y.

DEAR SIR: Have you enny Telegraph School that you warrant them a situation on the Union Pacific R. R. If so please send me a circular and terms and where.

Yours, & C.,

Laceyville, Wyoming Co., Pa.

REPLY.

Dear Juvenile: You are not wanted on "enny turms" until your studies are more advanced. We have no "circulars" for your persuasion, only for girls from eighteen to twenty-four, and that is not in your way.

#### Smoking in Telegraph Offices.

MARCH 16, 1868

EDITOR JOURNAL OF THE TELEGRAPH:

I would like to call your attention for a few moments to the consideration of a practice, which is exceedingly prevalent among all classes of men, and it seems to me more so among Telegraph employees than any others. I allude to the habit (and it is nothing else) of smoking. I wonder if it acts as a sort of stimulant, and helps arouse the sluggish powers, enabling them to keep pace with the "lightning steed." It seems to me to be a very ungentlemanly practice, to say the least, and I would like to inquire why a telegraph office should not be kept as free from the vile smoke as are banks, insurance offices, and other places where business is transacted. I am a little interested in an office not a thousand miles from New York city, where the public, as well as the employees of the office, seem to consider it "the" place to congregate, and (as they say) "enjoy" their favorite Havanas. It would seem that there ought to be self respect enough, or respect for the delicate olfactories of some of our lady customers, to induce the operators of an office situated as the one I refer to is to forego the pleasure (if it indeed be such) of a smoke during business hours. Is there no way by which this intolerable nuisance can be abated? It surely cannot be healthful to breathe an atmosphere so largely impregnated with the fumes of tobacco, and I wish that our smokers could be prevailed upon to smoke elsewhere and try and relieve the office from the odium which now rests upon it. I think I am safe in asserting that you are not a smoker, and can sympathize with me, being the only one here who does not indulge in the weed in some form, and judging from the Bible standard, there are hardly enough temperate ones here to save the place from utter destruction, should the angel of death see fit to shake his dark wings over our devoted heads. I wonder if President Orton couldn't be induced to issue an order prohibiting smoking in every office during business hours. Such an order would be the cause of great rejoicing to those of the employees who do not smoke, would please those of the public who do business at such offices, and *could not* in any way injure those who are in the habit of using the article. If you can in any way bring about such a happy result, you will be considered, by some at least, one of the benefactors of your race. If you should think this worthy of mention in the JOURNAL, will you please omit my name and location. Would like to see your views on the subject. Respectfully,

DECENCY.

#### New Telegraph Battery.

A foreign exchange says that a modification in batteries has been introduced by M. Ney. It consists of the ordinary copper and zinc elements, but placed in different solutions to the general variations of the Daniell cell. An amalgamated plate of zinc is placed in a vessel filled with a solution of chloride of ammonia; in this vessel is the porous cylinder, containing the copper plate, immersed in a solution of carbonate of copper. It is contended for this battery that it is constant in action, and remains so for a length of time. It can be maintained for a great period in active operation, if the liquid ammonia be replenished; for this purpose, it is sufficient to drop in solid chloride of ammonia. The natural carbonate of copper can be used. It is suggested that if required for military purposes, or for any service requiring transport, or where the batteries are liable to be carried about, it is only necessary to use sand impregnated with a solution of chloride of ammonia, instead of the solution itself.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, APRIL 1, 1869.

### Decency in Telegraph Offices.

A correspondent complains of the practice of smoking in the office where he labors. He has a right to do so. We do not offer a moral objection to the cigar or chibouk, for we do not understand their influence, and we rather like to see an elderly gentleman, after a comfortable dinner, sit down beneath the grape vines, or in his library, or even by his fireside, and enjoy a whiff of a good Havana. But to smoke in an office devoted to a decent vocation is execrable, and in bad taste. Especially is it objectionable in all avocations where the parties are in constant contact with the public, or where the duties require careful concentration of the mind to perform them correctly. The telegraph office we deem essentially of this character. It should itself be clean, neat, appropriate, so as to suggest the personal respectableness required of its occupants, and everything connected with it, and every employee, should in some way deepen the impression that the business is respectable.

We remember, some years ago, entering unknown one of the large telegraph offices, to make some inquiry. The receiver had his hat on and a cigar in his mouth. He answered our inquiry without lifting his eyes from a paper he was reading. The office itself had an ungainly look, as if neatness was an unknown quality. We heard men laughing and calling to each other. The whole appearance of things struck us as hideous and inconsistent with the business, and yet very consistent with itself. The smoking and the disorder were natural results of each other, and both alike improper. The effect on personal character of such practices, in such circumstances, cannot fail to be prejudicial. The company that permits it must suffer also. An institution which does not respect itself cannot long command it from others.

All connected with a telegraph office should be not only cleanly in their habits, neat in their personal appearance, and genial in their manners, but should meet the public with more of that decorum which banking houses exhibit than even these present. We want the respectability of the telegraph as a pursuit and as a public blessing asserted. We should like to see smoking absolutely forbidden during the office hours or in an office at all. It is offensive to good manners, to the ladies, many of whom have to frequent our offices, and to good taste. It leads to other irregularities, and is pernicious. We beg that it may be abandoned without the need of any executive order, or with it, should that be necessary.

### Meteorological Telegraphic Observations.

Most of the European journals, especially those of Vienna, obtain by telegraph and give the details of temperature and the pressure of the air in a much more comprehensive manner than is customary in the United States. The *New Free Press* of Vienna, gives daily, in a table, very neatly arranged, the pressure of the air, and states in another column the actual condition as well as the amount of variation from the normal. It also furnishes the temperature according to Celsius' thermometer, which is the one accepted by science, and regarded as much better than Fahrenheit, giving all variations from the normal. It also states the direction of the wind, and its strength, and the appearance of the sky, whether

cloudy, what kind, and whether the weather is dry or rainy. In addition to this the condition of the weather at the nearest sea coast is announced. All this is followed up by explanatory notes stating, for instance, where the pressure of air is lowest, and where temperature is highest or lowest. The fall of rain within twenty-four hours, and where it took place, are also given. The table includes fifteen of the principal localities of Austria, and the information covers German Austria, Bohemia, Hungary, or about one-fifth of Europe. Sometimes the ozone condition of the air is given.

By such reports the public become familiar with the main points which enter into the conjunctions from which the weather in a given locality arises, and soon a body of men exist to whom the weather is no longer a chapter of accidents, but who comprehend it as the result of natural causes.

What has proved so useful in Europe must sooner or later find attention here. It is a kind of knowledge, it is true, which does not interest a large circle of minds, and appeals at first to those whose mental cultivation and leisure lead them to desire intimacy with general science. Yet this by no means proves that it is not needed. All maritime interests would find in systematized meteorological observations valuable knowledge and safety, and even the general public would ultimately utilize such a knowledge to regulate many of their arrangements and decide their plans. To agriculture it would become of surpassing value, provided the daily newspaper kept pace with the electrical intelligence in its circulation among those who till our farms and reap our harvests. We cannot as yet see how the firing of cannon at county towns will ever give any intelligent directions to farmers to enable them to save crops, as proposed by Mr. Watson, of Washington, but many years cannot pass without something being accomplished in this direction, and by adequate means.

### American Compound Wire.

It is not the business or design of this paper to puff articles proposed by sanguine inventors as panaceas for existing wants. So few of these have proved of permanent practical use, that even when an apparently valuable improvement is presented for acceptance, a thing desirable and needed, we have felt compelled, by experience, to bid it wait the verdict of actual use, and bide its time. Had we desired to make bids for advertising, we could have easily added page upon page by cheering every inventor's whim, and induced a large waste of money while making it for ourselves. But we did not deem this our proper path, and have preferred to bear the accusation of indifference to any hasty acceptance of the merits claimed for many things which we have not only seen but admired.

Here, however, is an article, the fruit of the brain of one of the best known practical telegraph and electric workers, of a man thoroughly honest and in earnest, who has given these last twenty-five years and more to the patient, careful, thorough examination of not only electric science, but of the means by which that science can subserve in the best way and widest extent the public necessities. We need not recapitulate all he has accomplished, for every intelligent operator, and every one who has followed the literature of the telegraphic art in America, knows the name of Moses G. Farmer, of Boston. We regard him as one of those to whom it is a richer compensation to add to the present knowledge of the capacities of the telegraphic art than any mere gain from the sale of his inventions. For this reason we are led to estimate highly the products of his industry.

Now, one of the wants of the telegraph system in America is a conductor superior to those in use so as to make it possible, at wider distances, to use the single circuit, without the intervention of repeaters, however ingenious these may be. Thus, it is not now possible with the machinery yet provided, and with the present conductors, to manipulate a printing instrument in a single circuit from New York to Chicago. That capacity must be found. What is wanted? a larger or better conductor? But a larger conductor will too greatly burden the poles, be difficult of erection, be awkward to handle, be an increase of exposed surface to storms and the accumulation of sleet. With increase of size there is, also, comparative decrease of actual strength, the proportion of

fibre decreasing as the wire is enlarged. All this is well known and appreciated.

Another want of the telegraph is increase of strength to conductors without increase of weight, so that the lines exposed to accumulation of sleet, often so disastrous and extensive, may be able to maintain themselves.

Now, it is because this compound wire provides for these two desirable things that we look upon it with eager interest. What is it? Of what is it composed? Has it been tested?

The compound wire, to which attention is called in another column, is simply a steel wire covered with copper, the steel providing the element of strength in largely increased ratio to its weight, the copper providing a conductor of increased capacity. A compound wire of half the ordinary size of that in general use is claimed to have twice the strength, twice the conductive power, and half the exposure. We state it roughly, and without reference to the tables which the manufacturers present of the capacity of the different sizes.

Now, if these are actual results, they are worth knowing, and valuable. We want now to know, is the copper so connected with the steel that it will not flake? Is the copper so considerable a part of the whole body of the wire that lightning traversing the wire along our great prairies will not fuse it? Of the tenacity of steel we do not need knowledge. But the steel with the copper stripped from its surface will only leave strength at the loss of a more valuable quality. What are the facts respecting this?

It is easy to see that if what is claimed for this wire be correct, it must be of incalculable advantage in many countries where great strength is required. The lines from St. Petersburg to the Amoor are of this character, as well as our own lines which must yet traverse Alaska. To science, also, it claims attention. We are not content with the loss of eighty one-hundredths of a second between Cambridge and San Francisco. With a single conductor we believe the time would be found positively nil. Let this new gift to the telegraph and to science be examined fairly and fully. Its claims are too great to be either dismissed or undervalued. If correct, compound wires of the present size will give such power and such capacity as to dispense with half our repeaters, and make possible results now unattempted.

### Elegant Scientific Diction.

In a prominent paper hailing from a good city nearer sundown than New York, we find the following charming description of a thunder storm, which shows a skill in the use of Webster, and a nice felicity in description, which must be very refreshing to all our readers. If men and women could only be induced to converse in this manner with each other, how delightful would be their mutual interviews!

"During the thunder storm of yesterday the stable of Mr. John Jones became subject to electrical conditions. There resulted a violent molecular electrical agitation whereby a hole was undulated or rotated through the roof of a barn. The peculiar motion of the molecular was finally carried to and communicated through a hay mow, setting it on fire, and thence through the body of a horse whereby death resulted."

What a delightful thing it is to be scientific!

### A Wonderful Observation.

There has been observed recently at Paris, upon two wires held by the same support, and employed for the Prussian dispatches, disturbing influences of a peculiar nature, the causes of which cannot be exactly defined. At each opening and closing of the current upon one of the conductors, there is exerted upon the other an influence sufficient to disturb the correct working of the receiver at the other end of the line!

These effects, which one is tempted to attribute to the phenomena of deduction, have called forth the most earnest attention. Moreover, the Administration of the Telegraph Lines has urged the operators to investigate and experiment, in order to study this interesting question.—*Journal des Telegraphes.*

NOTE.—This is either very innocent or very sarcastic.

THE Atlantic Cable is growing more perfect in its insulation month by month, it is said.

## OFFICIAL STATEMENT.

## Western Union Telegraph Company.

	Feb., 1869.	Feb., 1868.
Total Receipts.....	\$575,249 07	\$600,183 32
Total Expenses.....	354,855 72	345,865 52
Net Profits.....	\$220,393 35	\$254,327 80

## Telegraphers' Mutual Life Insurance Association.

## ASSESSMENT NO. 7.

To the Members of the Telegraphers' Mutual Insurance Association :

At the time of the three deaths for which the assessment of two dollars was made, the number of certificates issued was 399. To the call of the Treasurer, 346 members responded promptly, and the money was placed to the credit of the heirs of the deceased. Of the fifty-three unpaid, several have moved away or resigned, one of the latter "because it had done him no good, although he had been in it a year." One-third are able to pay, but have neglected to do so, or have failed to receive notice, and a third are those who, from inability, or having entered the organization without a definite idea of its character or claims, have allowed themselves to drop out of its ranks.

Since then 111 new applications have been received, which will make 457 actual membership, should no more assessments be paid, a very gratifying increase, and to which daily accessions are being made. These additions are from men who have been stimulated to it by the sad facts of mortality the last few weeks have presented, and who desire to aid in so good a work as is opened up to them by the association, as well as care for their own families. The stability of the association, its reliability, has thus been greatly increased. We expect to find it a membership of prompt, right-minded men, who will thus honor the calling with which we are connected and themselves.

We have now the duty of calling for one dollar from each of you whose certificates are dated prior to the death of J. Frank Stevens, March 2, 1869, and trust it will be responded to with the same promptitude which has been shown in answer to former calls. Remittances will be addressed to

D. R. DOWNER, Secretary,  
145 Broadway, N. Y.

[Box 3,393.]

The disposition of the funds thus far has been as follows:

Family of	Seba Christie.....	\$274 00
" "	Edwin A. Hall.....	246 00
" "	John T. Winne.....	325 00
" "	J. S. Vandusen.....	370 00
" "	James A. Allan.....	346 00
" "	W. W. Shipman.....	346 00
" "	J. Frank Stevens.....	346 00

\$2,253 00

A record of usefulness in eight months of which its members may be proud. When the membership shall consist of 500 reliable members we shall feel that the labor and anxiety connected with it have been abundantly repaid.

JAMES D. REID, Treasurer.

An English newspaper has an advertisement which, minus the punctuation marks, reads as follows: "Run away: my hired man John. His nose is turned up five feet ten inches high, and had on a pair of corduroy pants much worn!"

A MAN never feels more like a fool, nor looks like a pair of them, than when he wants to sneeze and can't.

## Snow in Canada.

It is not of frozen dewdrops we write. Many wish that Canada knew no other snow. Telegraphic snows in the New Dominion are not white, and graceful, and gentle. They are a kind of human leech, quick, sharp, cunning. We have a personal experience of the original "Snow," which is enough for a lifetime—one of those indomitable, cool, sleepless, insinuating men who are eternally boring, and win by sheer persistence. Under that same "Snow," if the papers which reach us be true, the New Dominion is passing through a perfect winter of grief. Three columns of densely printed matter, headed "The Age of Humbug Verified," attest the sufferings of the people on whom this "Snow" has been falling.

It is the old story. A new telegraph line is being built in Canada to relieve the people from monopoly and make a contractor happy. The contractor is of the "Snow" line and shows his education. He understands the value of the names of good men; knows how to arrange a Board of Directors. He is a bankrupt, with everything to make and nothing to lose, sees a fine margin in building a "snow" line at \$250 per mile, and "seizes the opportunity." "Old Josiah" always "seizes the opportunity." They are numerous. Here is what the *Trade Review* says of the contractor:

"Why, in the name of common sense, was Mr. Seela Reeve ever selected by the directors to build this line? He had never built a line of telegraph in his life, he is not even an operator, and knows nothing about the business; he had no capital, was already bankrupt, and his connection with the Snows, both in business and relationship, sufficiently intimate to be grounds for suspicion. Why, we repeat, was he selected by the directors? Is the explanation not found in the fact, that instead of being selected by the directors, the directors were selected by him! for the purpose of carrying out his design of duplicating the Grand Trunk job. Should he be successful, and build for the Dominion Company 2,000 miles of line, in accordance with their programme, he will have made at least \$200,000 by the operation, for which the stockholders will be compelled to pay; and on which they expect to make a dividend. To show how he expects to make the mileage increase, we append a paragraph from the *Hamilton Spectator* as to the circuitous route taken to Wellington Square, a place about seven miles east of Hamilton—'To go to Wellington Square, the Company have built their road to Dundas, thence to Bullock's Corners, thence to Waterdown, and thence to the Square, making in all a circuit of some thirty odd miles. We do not say that this circuit has been made because the contract is a mileage one, and because it traverses a country where poles are at hand, and therefore cheaply obtained and easily put up. But it would puzzle a Philadelphia lawyer to understand for what other reason this circuit has been made.'"

Oh! the beautiful Snow and the relative Reeve. How all this awakes in us recollections of past years. When "Josiah" used us to order his goods, and left us the honor of paying his bills! Bah! And what beautiful lines rose along the wooden fences of Michigan, fairy lines, slim, delictae, genteel! Oh! the beautiful Snow.

## Deaths by Lightning.

Few people are aware how many are the deaths from lightning. It appears, from statistics kept in France, that during the last thirty years more than 10,000 people were struck by lightning, of whom 2,252 were killed outright. 880 were killed during the last ten years, and of these only 243 were females. If lightning falls on a cloud, it does more mischief among the men than among the women, the latter persons being most exposed.

Animals are frequently stricken, while those in charge of them are spared. The old idea that the beach tree is a protection is a fatal error, the neighborhood of all isolated trees being dangerous, except when they are in metallic connection with the soil.

Railroads and telegraph wires are protectors in so far as they are able to absorb and convey considerable amounts of electricity. Every locomotive does this unperceived, its metallic mass being an excellent conductor. Walking along a railroad track, where it runs through a country without trees, is as dangerous as taking shelter under a tall tree. That windows are dangerous is believed to be an error, for experience does not show that lightning strikes through open windows or follows a draft of air.

A TELEGRAPHIC message was recently sent from London, and a reply received from Calcutta in less than 7½ hours.

## IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

## AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York.

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

## THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

## THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

## GREAT AND UNIFORM STRENGTH.

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

## THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high-cost Norway Iron Wire, in the same locality and strung at the same time, was broken in several places.

Address—

## AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

## The Future as seen by the N. Y. Herald.

A new era commences to-day, March 4th, with a population that may be practically estimated at any figure between one hundred millions and five hundred millions of people, marching shoulder to shoulder under a system of political consolidation on the broad path of empire. Their arms are the steam engine, the electric telegraph and the independent press, and the victories they will achieve are beyond the wildest dreams of human thought to-day. The last generation compassed progress from the slow coach to the rapid car, from the uncertain sail to the certain paddlewheel, and has served its apprenticeship with the electric battery. Whoever believes that we stop here deceives himself.

## Velocity of Light and Sound.

It has been calculated that the deepest note which the human ear perceives as a continuous sound is produced by sixteen vibrations in a second; the acutest by 48,000.

The extremes of color are red and violet, the former given by 458 billions of vibrations per second, and the latter by 727 billions. The relative velocities of light and sound, and the relative refinement of the media through which their effects are conveyed, are illustrated by the comparison.

## Born.

Friday, March 26th, a son, to Mr. D. A. Van Ham, Manager Castle Garden telegraph office.

At Albany, N. Y., March 27th, a daughter to R. C. Rice, of the Western Union Telegraph office.

**To Publishers.**

This paper goes into every town and city of the United States, and Nova Scotia and New Brunswick where a telegraph office is to be found. As far West as Vancouver's Island, and as far East as Plaister Cove, as well as to the chief cities of Canada, the JOURNAL OF THE TELEGRAPH is sent and read. In this circulation it is peculiar. It goes also into numerous houses of telegraph and railroad managers and stockholders. For giving publicity to a large class of publications, it is one of the most advantageous which can be found. We do not ask publishers to send their books to us for notice. The advantage of their doing so should be apparent enough.

**To all Telegraph Offices.**

When you receive a message for a large city, demand a full address. New York, for example, is a large village, and has in its population hundreds of Browns and thousands of Smiths. A full address quickens delivery.

**How they Rise.**

A. B. Cornell, Esq., for many years manager of the New York office of the New York, Albany & Buffalo Telegraph Company, has been appointed surveyor of the port of New York. So far as we can learn, this appointment was entirely unsought and unexpected. It is a post requiring firmness, unswerving honor, and zealous labor. All of these Mr. Cornell will give, and will find that his old engagements have been a useful preparation for his new duties. We believe he will honor this important national trust.

WASHINGTON, March 30.

The Senate Committee on Foreign Relations, at a meeting to-day, agreed to report a general bill prescribing the regulations under which foreign telegraph cables may be laid on our shores. The bill is substantially the same as that reported at the last session.

**The Meeting of the Rails.**

The successful building of the telegraph between the two oceans made the connection by rail apparent and possible. We hail the near consummation of the gigantic work.

The distance on the Pacific Railroad from Omaha to Sacramento is 1,760 miles. The Omaha line is to-day 1,056½ miles west of Omaha. The Sacramento line is 594 miles east of that city, leaving a gap to-day of only 110 miles. There is a contest here between the two companies as to where the two roads shall meet. The California end is desirous of having the junction at Ogden, 1,029 miles from Omaha, but the Omaha or Eastern line to-day crossed Bear river with their engines and track, 31 miles west of Ogden, and will reach Monument Point before the California end comes up. This is 1,105 miles from Omaha. It is to induce the Eastern line to stop building and await the arrival of the Western rail that the contest is now going on. General Grant and his Cabinet have decided that the Omaha line shall go on until it meets the other, and that the issue in advance of bonds by Mr. Browning to the California end cannot be so construed as to arrest the building of the road, which will be completed, if both companies go on, by May 1.

**Fast Time.**

The Western Union Company's New York Stock Exchange office, under the management of Mr. J. Horn, sent and received from Philadelphia on the 18th ult., in one hour, from 12:26 to 1:26 P.M., 96 messages. The operator was interrupted three times by other offices, reducing the time about six minutes.

**Telegraph in Mexico.**

During the last session of Congress a law was passed authorizing this Government to construct a wagon-road from Queretaro to a point on the river Panuco, or one of its tributaries, from whence navigation might be practicable to Tampico. The engineer, Don Jose M. Romero, was named to survey the ground, and he has made a very lucid report, in which he estimates the cost of construction from Queretaro to the rancho del Mirador, on the river Moctezuma, an affluent of the Panuco, in \$800,000—for a distance of 62 leagues. A telegraph line has been commenced to communicate the town of Sombrerete with the city of San Luis Potosi; and the Governor of Zacatecas has invited the Governor of Durango to co-operate with him for the establishment of telegraphic communications between the two States. An Evangelical society exists in the State of Zacatecas, and is increasing in numbers; its members are subscribing for the erection of a Protestant church.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York.  
APRIL 1, 1869.

To all Offices on W. U. Lines :

The following changes have occurred since March 15, the date of the last tariff order. Please note them in your tariff book :

**NEW OFFICES.**

Charlotte, N. Y., reopened, tariff same as formerly.  
Elizabeth, W. Va., reopened, tariff 25c. more than Parkersburg, W. Va.  
Illopolis, Ill., tariff same as Niantic, Ill.  
Lainburg, Mich., tariff same as Owasso, Mich.  
Masonville, Iowa, tariff same as Manchester, Iowa.  
Niverville, N. Y., tariff same as Chatham 4 Corners, N. Y.  
Quincy, Mass., tariff same as Harrison Square, Mass.  
Raymond, N. H., tariff same as New Market Junction, N. H.  
(Business for Raymond will be checked to New Market Junction.)  
Riverton, N. J., tariff same as Bordentown, N. J.  
Seville, Ill., tariff same as New Philadelphia, Ill.  
Winnetka, Ill., tariff same as Evanston, Ill.  
Harlem, Mo., }  
Delassus, Mo., } Offices formerly known as "Caton office"  
will use "map tariff" for Harlem and Delassus. All other offices will make tariff to Harlem same as Kansas City, Mo., and to Delassus 65c. more than St. Louis, Mo.

Indianola, Texas, }  
Lavaca, Texas, } Tariff same as Austin, Texas  
Victoria, Texas, }

**OFFICES CLOSED.**

Concord, O., Henderson, Texas, York, Ala., Bear River, Utah,  
White Tail, Mon., Salina, Mich., Tyler, Texas, and Mamawock, N. Y.

**GENERAL INFORMATION.**

Those offices which have heretofore sent business for points named in the following list via Boston, Mass., Springfield, Mass., or Burlington, Vt., will hereafter compute tariff to the same points by adding to their rate to Boston, Springfield or Burlington the rates given, herewith, from those offices. Offices having "Special Sheet A" will use special rates.

The rate to be taken will be that amount found to be the lowest after adding as directed.

For example : New York to Gardner, Mass.

By referring to the list the rate to Gardner is found to be—  
From Boston, 40c. ; Springfield, 50c. ; Burlington, 60c.  
Add N.Y. to Boston, 30c. N. Y. to " 30c. N. Y. to " 1 00  
The result is, ————  
via Boston, 70c. via " 80c. via " 1 00

The rate to be taken will be the lowest, 70c.

Hereafter check direct with Coatesville, Pa. Tariff from offices on Pennsylvania R. R. between Philadelphia and Altoona, 25c. From offices between Altoona and Pittsburgh, 30c. From all others, 25c. more than Philadelphia or Harrisburg, taking lowest rate as explained in JOURNAL of February 1.

The tariff to points between Salt Lake City, Utah, and Helena, Montana, from offices East of Omaha has been made as follows: Virginia City, Mon., 1.00 more than San Francisco, Cal. Snake River, Idaho, 50c. more than San Francisco, Cal. Ruddy's, Idaho, 60c. more than San Francisco, Cal. Brigham City, Utah, same as San Francisco, Cal. Ogden, Utah, same as San Francisco, Cal.

Where the rate to points on "Other Lines" from Salt Lake City has heretofore been 50c. for ten words and 2½c. for each additional word, it is now 50c. for ten words, and 20c. FOR EACH ADDITIONAL FIVE WORDS OR UNDER. Where it is 1.00 and 5 it is now 1.00 and 40c. FOR EACH ADDITIONAL FIVE WORDS OR UNDER.

Business for Kinderhook, N. Y., should be checked to Valatie, N. Y. Tariff 8 and 1 for other lines.

Tariff to Paxton, Ill., 55c. from Chicago, from offices sending business for that office via Chicago.

WILLIAM ORTON, President.

# Journal of the Telegraph.

## Spring has Come.

"Sweet is thy coming, Spring! and as I pass  
Thy hedgerows, where from the half naked sprays  
Peeps the sweet bud, and midst the dewy grass  
The tufted primrose opens to the day,  
My spirits light and pure confess thy power  
Of balmy influence."

We are informed by Mr. Billings that Spring has arrived. We believe him, altho' he has objections we don't appreciate. Mr. Billings should use boneset before breakfast. But hear him:

### SPRING AND BILES.

Spring came this year az mutch as usual, hail butuous virgin, 5,000 years old and upwards, hale and hearty old gal, welcum tew York State and parts adjacent!

Now the birds jaw, now the cattle holler, now the pigs skream, now the geese warble, now the kats sigh, and natur is frisky; the earnest pissmire, the virtuous bedbug, and the nobby cockroach are singing Yankee Doodle, and "coming thru the rhi." Now may be seen the musketeer, that gray outlined crittur ov destiny, solitary and alone, examining his last year's bill, and now may be heard, with the naked ear the hoarse shanghigh, bawling in the barnyard.

Kittens in the doorway, and pupys on the green, neighbor chats with neighbor, and the languid urchin creeps listless toward the school. These things are all fust rate in their place, but spring brings pesky biles, and plants them carelessly, sometimes among the maiden's charms, and sometimes among the young men's. I kan tork like a preshure poet about biles just now, for i have one in full bloom growing on me, almost ready to pick, az big az an eggplant, and az full of anguish az a broken heart.

Biles are the sorest things ov their size on reckord, and az kross tew the touch as a setting hen, or a dog with a fresh bone. Biles alwus pick out the handiest place on youre boddy tew bild their nest, and if you undertake tew brake them up, it only makes them mad, and takes them longer to hatch out. There aint no such thing az coaxing; nor driving them away. They are like an impudent bed bug, they won't move, till they have got their fill.

Biles are az old az religion. Job, the profit, waz the fust champion ov biles, and he iz currently reported tew hav more biles, and more pashunce, to the square inch, than enny one, two very rare things to be found in enny man.

But say all ye kan about biles, call them all the mean names current among fishmungers, revile, and and persecute, and spit on them, groan, grin, and swear when they visit yer, hit them over the head, and set on them if yer please, there is a time in their career when they concentrate aul the pathos ov joy that a man has on hand to spare, and that iz—when they bust!

This iz bliss, glory, and revenge on the haff-shell. A man leans back in rektified comfort, az innocent and az limber az a mermaid. This pays for the fretful nights and nervous days while the bile has been hatching; this shows us what it iz to grin and bear it—this shows what it iz to be biled, and wrung out, and hung up to dry. This iz the calm after the storm, the wedding day ov pashunce, and joy; this is the christening ov hope, the mystick hen that lays 2 eggs a day; this is butter on yure sassigs.

A curious physiological experiment was recently made by placing a few grains of barley before a hungry pigeon. While pecking at the barley the brain of the pigeon was frozen by means of a spray of ether. The bird, being thus deprived of consciousness,

ceased pecking, and remained as if dead. The barley was then removed, and the ether spray having ceased, the brain was allowed to thaw. The bird soon returned to life, and its first act was to renew the pecking for a time, although no food was before it.

FEBRUARY 15, 1869.

The "Calcutta," bearing a portion of the telegraphic cable for the Persian Gulf, collided at sea with the Prussian bark "Lezard," which was sunk. In order to save itself the "Calcutta" was obliged to throw overboard the cable which it was carrying, the value of which was \$500,000 in gold.—*Journal des Telegraphes.*

## SPECIAL NOTICE,

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES;

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use, and office connections.

INSULATED WIRES.

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDICT BROTHERS,

No. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH

Watches Repaired in the most thorough manner, and Warranted.

## SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDICT BROTHERS,

Agents for the American Waltham Watch,  
691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platina point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Bathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,  
Office and Factory 86 Nassau Street,  
New York City.

**SHAWK & BARTON,**

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES.

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.,	&c.	&c.

We continue to manufacture Instruments after the favorite

WESTERN UNION STANDARD PATTERNS,

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

COMPLETE OUTFIT OF ELECTRICAL APPARATUS,

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

**BISHOP'S PATENT**

BALATA INSULATION

FOR TELEGRAPH AND ELECTRIC WIRES.

We are now prepared to furnish wire insulated with this new and valuable material, which, from the time in which we have had to test its merits, proves to be

VERY TOUGH AND PLIABLE,

WILL NOT BECOME BRITTLE,

WILL NOT CRACK,

IS NOT EASILY AFFECTED BY EXPOSURE TO THE WEATHER,

AND

IS A PERFECT INSULATOR.

Any size or style of Wire made to order at short notice by the only manufacturers,

THE BISHOP GUTTA PERCHA COMPANY.

SAMUEL C. BISHOP, General Agent,  
113 Liberty street.

**STICKWELL & CO'S**

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spanning "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the Aetiz, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

WHOLE NO. 35.

## Freaks of Lightning.

(From Harper's Monthly Magazine.)

Sometimes the sudden and violent discharges of great accumulations of electricity are accompanied at the time by a continual flow, affecting, especially, all the salient and projecting points in the vicinity, and even also extended surfaces, in many cases, where such surfaces are broken by minute projections. A very violent thunder-storm broke over the city of Paris on the night of the 16th of July, 1866, of which most extraordinary accounts were given in the papers of the following day. The clouds that were formed were enormous in mass and in density, and so rapid was the condensation of vapor that electricity was developed in immense quantities, and it passed to and fro between the clouds and the earth in every conceivable way. The consequence was a continual succession of the most vivid flashes of lightning, and an incessant crashing and rolling of thunder. The lightning struck and did serious damage in many places. In one instance it fell upon one of the gas tubes in the street. It fused a portion of the tube, and set the gas on fire, which, in its burning, illuminated the whole surrounding region, and produced universal alarm. While these effects were produced by the violent discharges coming in rapid succession from the accumulations of electric force, there seems to have been also a flow of a more gentle and quiet character, directing itself upon all conducting surfaces and masses, and especially upon every projecting point. Most extraordinary accounts were given in the papers the next day of the lambent flames seen alighting upon every prominent point in the streets, or gliding along the water-courses, or blazing up from the openings of the sewers. Some people saw the street in certain places, as they said, full of fire. These accounts were, no doubt, greatly exaggerated, the minds of the observers being much disturbed by their excitement and their alarm. There is, however, every reason to believe that there was a great deal of reality in the foundation of the stories.

In the eastern part of Paris, at the place formerly occupied by the Bastille, there stands a tall column called "The Column of July," being so named from certain great events which occurred during that month on a certain year, and which the column was intended to commemorate. Upon the top of this column is a statue of Liberty standing on tip-toe, and with symbolic wings at its back, extended as in the act of commencing to fly. This column was observed carefully during the storm by a responsible witness, who states that electric light emanated in brilliant coruscations from all the salient points of the figure above, and passed in a luminous stream from the upraised foot to the ball below on which the figure was poised.

Other witnesses testify to a similar illumination of the summit of the spire of Notre Dame, a tall and slender spire which forms a very striking and most beautiful contrast to the massive towers which form so conspicuous a feature in the facade of that building.

This spire rises to a height of nearly three hundred and fifty feet into the air, and the electrical effect observed on this occasion may have been increased by the enormous quantity of lead used in the structure, and especially in the statues and other ornaments pertaining to it.

A great many curious tales are related of extraordinary interpositions of the electric force in some of the most striking dramas of human life. Arago gives an account of the chief of a band of brigands being struck down in the court-yard of a prison in Bavaria, in the midst of his comrades. He was seated on the pavement, or on a stone, being fastened by an iron chain to a fixed ring or staple, his companions, bound in a similar manner, around him. The electric charge, controlled probably in some degree by the chain and the iron fixture to which it

THE COLUMN OF JULY.

was attached, passed through the body of the chief and instantly killed him. His comrades, knowing nothing of the natural laws by which this terrible agency is controlled, were struck with consternation, believing that the lightning had intelligently selected their ringleader, by the special judgment of Heaven, in retribution for his crimes.

In this case, and indeed in many such cases as this, the body of the brigand was so situated as to form part of a chain of communication well adapted for the electricity to pursue in its passage from the atmosphere to the ground. It is always dangerous in a thunder-shower to be so situated in relation to surrounding bodies that are good conductors as to form with them a channel for the passage of the force.

## [From Appleton's Journal] Magnetic Effluvium.

BY VICTOR HUGO.

The snow storm is one of the unknown quantities of the sea. It is the most obscure of meteors, obscure in every sense of the word; a mixture of fog and tempest, a phenomenon not yet well explained. This uncertainty causes many disasters.

Men try to explain every thing by the wind and the current. Now, there is in the air a force which is not wind, and in the water a force which is not current. This force, the same in the air as in the water, is effluvium. The air and the water are two masses of liquid, nearly identical, and changing mutually into each other by condensation and dilatation, so much so, that breathing is a species of drinking; the effluvium alone is fluid. The wind and the current are only impulses, the effluvium is a steady stream. The wind is visible in its clouds, the current in its foam; the effluvium is invisible. Yet from time to time it says, *There I am*, and its way of saying so is a thunder-clap.

The snow storm presents a problem analogous to that of the dry fog. If an explanation of the Spaniard's *callina*, and the Ethiopian's *quobar*, be possible, this explanation will certainly be made by attentive observation of the magnetic effluvium.

Without the effluvium, a host of facts remain enigmatic. The altered velocity of the wind, changing in a storm from three feet to two hundred and twenty feet a second, may possibly cause the alteration of the waves, rising from three inches in a calm, to thirty-six feet in a stormy sea; the horizontalness of the blasts, even in a squall, may possibly make us understand how a wave thirty feet high can be fifteen hundred feet long; but why the waves of the Pacific are four times higher near America than near Asia, that is to say, higher at the west than at the east; why it is the contrary in the Atlantic; why, under the Equator, is the middle of the sea which is highest; why these ocean swells change their place: this is what the magnetic effluvium, combined with the rotation of the earth and the attraction of the heavenly bodies, can alone explain.

Does it not require this mysterious complication to understand an oscillation of the wind, going, for instance, by the west, from southeast to northeast, then returning abruptly by the same great round, from northeast to southeast, so as to make in thirty-six hours the prodigious circuit of five hundred and sixty degrees, which was the course run over by the snow storm of March 17, 1867?

The storm waves of Australia reach eighty feet in height; Australia is near the pole. A tempest in our latitudes is due less to the disturbance of the winds, than to continuous electric submarine discharges; in 1866, the transatlantic cable was regularly impeded in its working two hours out of twenty-four, from noon till two P. M., by a sort of intermittent fever. Certain compositions and decompositions of forces cause phenomena, and thrust themselves on the sailors' calculations, under pain of shipwreck. The day when navigation, now a routine, shall become a mathematical

science; the day, for instance, when men will try to find out why, in our climate, hot winds sometimes come from the north, and cold ones from the south; the day when we shall understand that the diminutions of temperature are proportioned to the depths of the sea; the day when we shall have before our minds the fact that the globe is a great magnet polarized in space, having two axes, one of rotation, one of effluvium, cutting each other at the centre of the earth, and that the magnetic poles revolve round the geographic; when those who risk their lives shall choose to risk them scientifically; when the unstable medium of navigation shall have been studied; when every captain shall be a meteorologist, every pilot a chemist—then will many catastrophes be avoided. The sea is as much magnetic as water; an ocean of forces floats, unknown, in the ocean of currents; down stream we may say. To see in the ocean only a mass of water is not to see it at all; the ocean is a coming and going of fluid as much as a flux and reflux of liquid, affected even more by attraction than by hurricanes. Molecular adhesion (shown by capillary attraction, among other phenomena) shares, in the ocean, the grandeur of the ocean's volume, and the waves of effluvium sometimes assist, sometimes oppose, the waves of the air and the water. He who knows not the electric laws knows not the hydraulic, for they interpenetrate. True, no study is more difficult or more doubtful; it borders on imposture, as astronomy borders on astrology. But without it there is no real navigation.

#### Shiftlessness of an Artist—What Came of it.

An artist in *Harper's Monthly*, says: "In the spring of 1841 I was searching for a studio in which to set up my easel. My 'house-hunting' ended at the New York University, where I found what I wanted in one of the turrets of that stately edifice. When I had fixed my choice, the janitor, who accompanied me in my examination of the rooms, threw open a door on the opposite side of the hall and invited me to enter. I found myself in what was evidently an artist's studio, but every object in it bore indubitable signs of unthrif and neglect. The statuettes, busts, and models of various kinds were covered with dust and cobwebs; dusty canvases were faced to the wall, and stumps of brushes and scraps of paper littered the floor. The only signs of industry consisted of a few masterly crayon drawings and little luscious studies of color pinned to the wall."

"You will have an artist for your neighbor," said the janitor, 'though he is not here much of late; he seems to be getting rather shiftless, he is wasting his time over some silly invention, a machine by which he expects to send messages from one place to another. He is a very good painter, and might do well if he would only stick to his business; but Lord!' he added, with a sneer of contempt, 'the idea of telling by a little streak of lightning what a body is saying at the other end of it!'

"Judge of my astonishment when he informed me that the 'shiftless' individual, whose foolish waste of time so excited his commiseration, was none other than the President of the National Academy of Design—the most exalted position, in my youthful artistic fancy, it was possible for mortal to attain—S. F. B. Morse, since much better known as the inventor of the electric telegraph. But a little while after this his fame was flashing through the world, and the unbelievers who voted him insane were forced to confess that there was at least, 'method in his madness.'"—*Scientific American*.

\* The "dirt" in Mr. Morse's studio is a piece of decided art. Mr. Morse is provokingly clean, and there is no disorder which can long exist where he is master.

#### The West and the Men Wanted There.

OMAHA, Neb., March 16, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

We here, on what was once considered the "border" but now fast becoming the "centre" of civilization, occupy by virtue of our position a sort of watchtower, from which by one swoop we take in the doings and undoings of all the land; and it is a splendid panorama laid out before us. From the North, with its frozen hills and visionary Pacific railroads, the South, with its struggling mass of mixed humanity emerging from the gloom and darkness of civil war and disaster, the East, with its overcrowded workshops and cities in which the ghastly spectacle of the "Struggle for Life" is painfully depicted in the squalid wretchedness of misery and degradation, we turn to the West, the "Great West," where one may breathe the pure air of heaven without ascending to housetops, where every willing hand and heart may find plenty of work, where man is lord and master of the situation and making giant strides of progress, hewing out solid fortunes by the labor of his hands; not eking out a bare subsistence, and lying down in a pauper's grave as his reward of a life-long toil. We do not mean to infer that a man may easily amass wealth here. It can only be done by knocks, hard and fast, upon the coffers of nature. But somehow, a person feels differently when pounding away on these vast prairies, than when pecking listlessly in the pent-up corners of yon East. His soul and heart expands, his ambition—and sometimes his dander—arises, and he puts forth his strength with a willing firmness of purpose. An emigrant from the East need not come here with any other idea than that of work.

Our own chosen profession is no exception to this rule. The Union Pacific seems to be the great "Eldorado" of from six to eighteen months old and "college" telegraphers. Let me assure them the country is not yet a paradise, neither are the railroad stations palaces. The best situations are not superior to the common run in the East, except in so far as they may better afford a diligent and capable man opportunities for "working up," in consequence of frequent changes, and they can be accepted only at the sacrifice of many personal comforts and luxuries. The ordinary places are such that we would not advise an Eastern operator earning twenty-five dollars per month to sell his last shirt for expense money while on his way to accept them. Unless a man is first-class, he stands a poor show.

Perhaps this latter sentence is a waste of ink, as methinks I hear every "fledgling" in the profession at once say, "Oh, well, he doesn't mean me;" for it's a notorious fact they think there's no question of their ability to "take a hundred words a minute," or perform any other miraculous thing, but it is nevertheless just as true that this is the class in which I would discourage the idea of coming West at present. Not that I would make light of their abilities or efforts, but their chances for attaining skill in their art is better there than here; besides which, they dispense with poor accommodations and many "gray-backs."

Perhaps you want some "news" items of interest to the trade, but I have little at present, and even that I will defer for a time. It will keep.

TIM TON.

#### Velocipedes.

MARCH 27, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

I see in your issue of March 15, an article on "Velocipedes" for messenger boys. I ask, why could it not be done? especially in towns or places where the office is not allowed a messenger boy because it does not pay enough, and where the operator has to deliver messages. In such cases the operator very often

cannot be spared long enough to deliver a message even through the town. How must he do when he has a message for a party out of town, when it will take about an hour or two to go. I repeat, in these cases, which are very often, they come very good if they have them, and it would be a great saving to the company. They could afford to lay out a small sum now, and reap the benefit in the future. It would not take much more than a couple thousand dollars to supply these places with them.

I hope and think the company will not hesitate long to supply these offices with the needed article—velocipedes. Yours, M.

#### Insulation of the Atlantic Cable.

The *Boston Journal of Chemistry* asserts, on the authority of a gentleman intimately connected with the working of the Atlantic Cable, that the insulation is growing monthly more perfect, and that the first cable, laid four years since, leaks less than the last one. The loss, at the present time, does not reach half of one per cent, upon both cables. This is surprising, and very encouraging to the owners of the line. The extreme cold of the deep sea basin, in which the wires repose, is favorable to the retention of the electrical impulses in the channel provided for them. The time consumed in charging and discharging the conductors is a bar to rapid communication; but this is to be overcome by new methods of insulation. A device has recently been brought forward which promises to fully remove this obstacle, and thus enable submarine cables to perform double the work in the same length of time. The success of deep sea cables is now fully assured, and we may look for a large increase in the number during the next quarter of a century.

#### Philosophical Uses of the Beard.

The inhaling of metallic particles to which certain workmen are exposed, is replete with serious and lasting effects. In autopsies of persons who have died from pulmonary consumption, the lungs are frequently found filled with the substance belonging to the peculiar business which they have pursued during life. Cotton, in the form of dust, metal filings, chemical vapors, fumes of copper, arsenic, etc., are but a small number of the many substances which enter the lungs and finally destroy the lives of those engaged in such occupations. The lace weavers of Germany, and those occupied in the paper-staining factories, are particularly exposed to these pernicious effects. Many temporary means have been tried to protect the artisans from such fatal consequences, but none have been found as effectual as the wearing of a beard and mustache. These and the hair which grows in the nostrils are found to be the best protection. All who have permitted their growth can testify to their efficacy in preventing the entrance of particles of dust, etc., and by a proper attention to cleanliness they will serve their purpose.

How to KEEP POOR.—There is no working man but who would rejoice to have the way pointed out by which he might honestly attain riches. No one would thank us for a prescription to insure poverty, and yet there is many a man who keeps himself poor by indulging in the following: two glasses of ale a day at ten cents, seventy-three dollars; three cigars, one after each meal, one hundred and nine dollars and fifty cents; board for a big dog, thirty dollars—all in one year, two hundred and twelve dollars and fifty cents—sufficient to buy six barrels of flour, one barrel of sugar, one sack of coffee, a good coat, a respectable dress, a frock for the baby, and half a dozen pairs of shoes. If you don't believe it, working man, figure for yourself.—*Detroit Union*.

**The Telegraph and the Press of the United States.**

[From the Journal de Telegraphes, Paris.]

The proposition submitted to the American Congress for the purchase of existing telegraphic lines by the Government, and for the working of the same, under the direction either of the Post-office Department, or of a separate bureau, has given rise to a lively discussion. The proposition has been sustained by a favorable report of the Postmaster General, and by Mr. Washburne, Representative from Illinois; but public opinion manifests itself so unfavorably towards the project, that its supporters will probably be forced to abandon it.

Almost the whole press, says the New York *Times*, demands that the control of the telegraph should rest in the hands of private industry, for the reason that the American Government never prospers when it is willing to exercise other than its regular functions in order to interest itself in business enterprise; and that the telegraph, if it should be placed under the control of the Government, would shortly become a political machine, devoted less to the interests of the people than to assure the ascendancy of a party. Finally, in no respect does public opinion show itself disposed to permit that the working of the lines, profitable as it now is, should be under the control of a system such as that of the Post-office Department, which is not even able to conduct its own affairs without a loss of many millions of dollars a year. It is evident that if Congress should ever be called upon to vote on the proposition, it would in all probability be defeated by a large majority.

Without discussing the question in a political point of view, to do which we are neither able nor willing, we have felt it our duty, under cover of an ordinary topic of interest to our readers, to make known the causes of the failure of this proposition.

We have also desired to state to what extent the American press make use of the telegraph, besides receiving the ordinary particulars of the legislative debate transmitted daily. In the New York daily papers frequently half of the reading matter is composed entirely of telegraphic dispatches. The correspondents at Washington telegraph at length their letters, and the written correspondence by no means holds the principal place in the columns of a first-class American journal. The Western Union Telegraph Company, comprising the largest portion of the American lines, announces that in 1867 it delivered to the press of the country 294,503,630 words at the moderate price of 0fcs. 175 per message of twenty words. This service was rendered principally in the late hours of the night, and at one-third to one-fourth the ordinary tariff rates in order to benefit the papers, and without profit. It seems that the number of messages transmitted by this company alone, exceeded in 1866 the number of messages transmitted by the entire lines of Continental Europe.

In the United States there are 4,126 telegraph offices, or, one to every 7,549 inhabitants; moreover, every city and almost every village has an office. There are in operation more than 80,000 kilometres of lines and more than 160,000 kilometres of single wire, together with 265 sub-marine cables.

To accomplish the service to the press without too great an expense, a combination has been formed of the several interests known already abroad under the names of "Associated Press," "Western Press Association" and "Southern Press Association." Of these, the "Associated Press" is in the most flourishing condition; it is supplied with news from its correspondents through special operators at Washington, as well as from many newspapers in other centres of intelligence. The corporative amount of news used by the press of different cities is shown by the payments made to the Western Union Telegraph Com-

pany. Of the 13,037,725 fcs. received from newspapers in 1867, the press of New York paid three-tenths; Philadelphia, one-tenth; Boston, Chicago and Cincinnati, each a tenth; St. Louis, one-twentieth; the South one-twentieth, and the West and the North each one-tenth, without, indeed, counting in the towns and smaller places above mentioned.

The "Associated Press," of which the headquarters are in New York, was organized a short time after the introduction of the magnetic telegraph, and has had for its base an alliance between the New York *Herald*, the *Tribune*, the *Times*, the *World*, the *Journal of Commerce*, the *Sun* and the *Express*. The proprietors of these seven papers are also at the head of the business of the association, although the details are principally directed by the general agent, Mr. James W. Simon-ton, of the New York *Times*, who acts under the control of a committee.

At Philadelphia, Boston, Baltimore, etc., there are similar associations between leading newspapers, represented, as at New York, by an agent under the control of the local association. But if the combination contains the principal newspapers of the seaport towns, it does not embrace them all. Some papers are not able to buy news from it; others are obliged to buy the news without having a voice in its control, and others are compelled to have even that privilege denied them.

The "Associated Press" of each city pay for receiving telegrams from other places, and for sending copies of them to the papers which they represent, and also for collecting the news of their own city and for transmitting to other points. They have agents in Europe, in China, on the east of the Pacific, in Central and South America, in the West Indies, and in every place from which it is profitable to receive news. At London they have an able representative who transmits by the cable intelligence of everything which is known to be new in Europe, and whose dispatches are so complete that they eclipse almost the use of the mails. The service of the cable and the transmission of the debates of Congress are of all the branches of service of the association, accomplished with the greatest success.

The "Associated Press" furnishes news to many hundred journals in different parts of the country. In order to pay the expenses, a certain sum is collected from the associations of the different cities each week in advance; those local associations then dividing the expense as agreed between the country papers.

The "Western Press Association" acts in the same manner for the United States, and exchanges its news with the other association at Cleveland, Ohio. The action of the "Southern Press Association" extends necessarily over the South, their exchanges being effected at Washington.

In pursuance with their arrangements with the Telegraph Company, the distribution of news is made simultaneously to all parts of the country, an operator being stationed in each city to receive them for local use. The intelligence is furnished complete to the newspapers having the right to receive them, and the editor makes use of it as he wishes. Practically, it results that in Philadelphia, for example, each paper procures daily an amount of telegraphic news sufficient to fill up a page of the *Times*, at a cost of from 75 to 100 francs. The generality of news comes from this source; but besides that, there are special correspondents employed to collect the news of which the "Association" has no knowledge, and the association's low rates of tariff permit a journal to apply almost all its resources in special correspondence.

As a general rule, the association limits its communications to facts, rumors and opinions being prohibited, and these rules are rarely infringed. The working of this system is sufficiently satisfactory, al-

though sometimes complaints are made of tardiness, or a lack of vigilance on certain points.

The American press has always resisted the establishment of a system such as that of Reuter, which puts journalism at the mercy of a private corporation, in which the service of the public is considered second to that of special interests. In America, the newspapers control their affairs and are able to displace their agents at will.

At one time, the agent of the "Associated Press" attempted to convert the organization into a means of personal advantage, but was superseded. He then attempted to found a rival system, but was forced to abandon the field; and thus was rendered sacred the principle that the superintendent of the concentration of the dispatches should not deliver them with a view to any personal advantages.

No American journal is able to assure itself of being permanently established without securing the news furnished by the Associated Press, which shows the value and importance of the intelligence collected by this combination.

**Interesting Experiments by Prof. Tyndall.**

Dr. Tyndall has made some very surprising experiments by passing vapors of different chemical substances into an exhausted glass tube, and then sending through them a beam of electric light. The vapor is at first invisible, but after the light has gone through it for a few seconds, it forms clouds of a blue, green, red, or mauve color, which break up into the most fantastic and beautiful forms, endowed with a rotary motion which adds greatly to their effect on the eye. In some instances, the cloud takes the shape of funnels overlapping each other, and, curiously enough, the inner ones can be seen through the outer ones. The most surprising of all is the vapor of hydriodic acid. The cloud is seen cone-shaped, supporting vases of exquisite form, and over the edges of these vases fall faint clouds, resembling spectral sheets of liquid. Afterwards, a change takes place—roses, tulips, and sunflowers appear; then come a series of beautifully shaped bottles, one within the other, and on one occasion there was seen the shape of a fish with eyes, gills, and feelers. What, it may be asked, is the use of all this fantastic beauty. The answer is, that Dr. Tyndall finds therein illustration of chemical decomposition, examples of molecular physics, and explanations of the formation of cloud and the blue color of the sky, whereof we shall hear more by-and-by, and by which science will be enriched.

**In Congress.**

THE NEW YORK, NEWFOUNDLAND AND LONDON TELEGRAPH COMPANY.

Mr. Chandler (Rep.) of Mich., called up the bill to authorize the New York, Newfoundland and London Telegraph Company to land its submarine cable on the shores of the United States. The pending amendment was that offered by Mr. Stockton, authorizing any company, chartered by the laws of any State, to land its cable on the shores of the United States, subject ultimately to regulation by Congress.

Mr. Stockton, (Dem.) of N. J., declared himself opposed to all legislation on this subject; but if it must be legislated upon he thought the bill ought first to go to the Committee on the Judiciary, because it involved the question of the right of Congress to authorize a foreign company to land its cable on the shores of a State of this Union. He believed that Congress had no such right, nor any right to legislate for the making of telegraphs or railroads, but only the right to "regulate commerce" upon roads and canals where made by the State. In the maintenance of this view he made a strong argument.

For the Journal of the Telegraph.  
Our Modern Prometheus.

No more the hours of awe and gloom,  
Which filled our childish hearts with dread,  
As rolled and crushed the thunder boom  
Through the storm curtain overhead;  
Now science grasps the lightning's fire,  
As t'were some infant's gilded toy,  
And speeds it o'er the thinking wire,  
On errands like a servant boy.

Honor to our illustrious MORSE,  
Whose genius first conceived and set  
This subtle, all pervading force,  
To learn and mark the alphabet;  
And through the long metallic line,  
Its myriad messages to spell,  
By many a deftly punctured sign,  
And sharply uttered syllable.

He trained this Mercury for men  
In ways exact, to wait and move,  
And execute as swift as when  
He served as messenger to Jove.  
Behind his wide and timeless flight,  
Our quickest thought but lags, and plods,  
And asks, through all their weary night,  
Who now shall serve the ancient gods?

Prometheus pitched their fire away,  
And they forgave the trespass never;  
But doomed him to the birds of prey,  
On the Caucasian crags forever.  
But one Prometheus, bolder still,  
Upon their trustiest helper came,  
And led him captive, at his will,  
And him they doom to endless fame.

CORNING, April 5, 1869.

J.

Telegraphic Fishermen.

PORTLAND, ME.

EDITOR JOURNAL OF THE TELEGRAPH:

Some years since when there was but one wire South of Bangor, we had a repairer who travelled under the style of L. D. (The "old boys" will recognize the title.) He was a man of large frame, and when well dressed, fine looking, especially when he was disposed to put on airs. He would take the most placid looking donkey that ever claimed the name of horse, and in a week's time transform him into an apparently fiery Bucephalus. I had occasion to be out on the road one day with him, and, as we were returning to the city, I suggested that we might carry home a few pickerel as well as not, as we could not get home before dark any way. We accordingly drove up the road to the tavern and bought a couple of fishing lines, and then drove on to the pond a short distance from the house.

We soon found some holes cut in the ice, and after bobbing a while, each caught a fish. After trying half an hour or so longer, I went up the pond further and tried some holes there. Not being successful, I returned and found L. D. rolled up in the buffalo robes, fast asleep. I went to his line and found there was something on the other end of it, and with considerable trouble I hauled out a pickerel of over three feet in length. I quickly had both lines in again, hoping to catch the mate, but had to give it up, as night was coming on. After winding up the lines I waked up L. D., and it was worth a quarter to see his countenance as he asked "where did you get that?" meaning the big fellow. Right under your nose I replied, and we started off. D. felt very much chagrined, and as we neared the tavern straightened himself up, and held the reins in his peculiar manner, as though it took all his strength

to hold the horse in. Just as we got opposite the house, one of the idlers standing in the door way sang out: "Guess ye didn't catch any, did ye?" D., with a powerful effort, suddenly stopped the animal, and with stentorian tones, looking towards the house, asked: "What do you say sir?" "Guess ye didn't catch anything, did ye?" was repeated. Turning to me with the air of a ring-master, and handing over the lines at same time, saying "Mr. B. will you be kind enough to hold these reins?" he began to brush away some of the hay which we had in the bottom of the sleigh, and taking the two pickerel which we first caught, and tossing them up one after another, until he made them think we had a sleigh bottom full, he raised himself, and with an impressive gesture of his hand, said: "Hold on! hold on! I will show you a sight!" and then reaching down he took the big fish by the gills and held him out at arm's length. "What do you think of that, hey! what do you think of that?" and shaking it a few times he carefully laid it away, all the time talking for the benefit of his audience, in his own peculiar style: "Didn't catch anything hey! no! not much, boy! How's these?" and he began to toss up the small ones again, when suddenly looking up he exclaimed: "Just you hold on a minute! I've got the father of 'em all here;" and, with great apparent effort, he got hold of the "big one" again, and slowly drawing him out, held him for a moment at arm's length, and said, with a face as sober as a Judge on the Bench: "My friends, when you catch any fish out of that pond, you just let me know," and then spreading the hay over the fish, and tucking in the buffaloes, he assumed the reins, and we drove on. We didn't speak a word until we reached the thick woods a quarter of a mile from the house, when we "busted" and made the old woods ring with our shouts and laughter.

A few months after this occurrence, I was passing that way, and stopped to dine at the aforesaid tavern. After dinner I went into the bar-room for a smoke while my horse was being harnessed. There were a number of loungers, and I noticed one gray-haired veteran eyeing me very closely. At last, as I was about rising from my chair, he spoke. "Look a here" said he, "warn't you out here last winter, fishing?" I allowed that I was. "Well," said he, "you drained the pond, you did. There hasn't nary a pickerel been caught in that pond since; not even a sucker." I told the old man the joke, and amid the boisterous laughter of the crowd, I drove off. It didn't cost me anything to stop at that tavern after that, until they got a new landlord.

SEMAJ.

The Telegraph as a Detective.

The telegraph is a foe to crime, and the most untiring of detectives. If it does not yet "put a girdle round the earth in forty minutes," it carries intelligence more than half way round with a degree of rapidity only excelled by the thought which directs it. For instance, not long ago, a Chinaman, who was a child of the sun and half-brother to a tea-chest, by the name of Hong-kee, (sometimes, we believe, corrupted into "Hunky Boy") came a celestial dodge on sundry merchants of California, by which he became unlawfully into possession of \$18,000 in the hard money of that specie-paying State, and went on board the Pacific Mail steamship bound for the Flowery Kingdom, thinking, in the innocence of his semi-barbarian heart, that, once there, he could mix himself among the several hundred millions of his fellow-countrymen who all look just alike, and riot in the luxury of a new rat every day for dinner out of his unlawful wealth. But he made a mistake. It seems that he had not fully appreciated the triumphs of modern science in a progressive civilization. The victims sent the light-

ning after him, across the continent, under the stormy Atlantic, by short cuts through Europe and across the Mediterranean, over the sands of a corner of Africa, and into the bowels of Asia, and, before the dishonest celestial had reached Hong Kong on the steamer, a message for his arrest awaited him there, and his first greeting was an accusation of guilt. Of course he metaphorically dropped his tail between his legs, and was anxious to part company with his bowels in the most approved oriental method, while his fond visions of rat pie were dissipated forever by this single stroke of lightning.—*Boston Herald.*

The Cholera and the Telegraph.

YAZOO CITY, Miss., March 24, 1869.

EDITOR JOURNAL OF THE TELEGRAPH.

Dear Sir,—Some two years ago, when the cholera was raging so fearfully all over the world, my attention was called by a brother operator to what he supposed to be a fact: that a telegraph office was a complete insulator from this terrible disease. He had worked in some of the principal cities of the Union during the prevalence of the malady, and had never known of a single individual, who spent most of his time in a telegraph office, being attacked by it.

His reasons for the above being the case were these: that all pure atmosphere contains a certain amount of ozone, which is oxygen in an active or highly electro-negative state. Cholera is caused by the absence or scarcity of ozone in the atmosphere. I do not now remember whether he gave any reason for the absence of ozone; but I suppose it is caused by the vaporizing from decayed vegetable and other impure substances.

The electric current passing through a telegraph office throws off this atmospheric purifier—for ozone is generated by electricity—a certain amount is thrown off at every beat of the electric pulse, which supplies in its immediate vicinity the much needed element, rendering the atmosphere pure and invigorating, and preventing the introduction of this disease.

If this is so—if a telegraph office is cholera-proof—why not make the world one grand telegraph office? or, to be less extravagant, upon the first approach of the disease in any locality, construct ozone generating machines, and repel the monster.

The above is called forth by my having mentioned the facts therein stated to an accomplished medical friend, who requested me to write to your journal and solicit inquiries as to whether any positive case of cholera has ever been known to have attacked an employee of the telegraph whose occupation required him to spend most of the business hours in a telegraph office where the instruments were constantly at work. If you have heard of such a case, please let me know, without publishing this; if not, a brief synopsis of above inserted in the JOURNAL, with request to any one who has heard of such a case to inform you, will very much oblige. Yours, truly,

Railroad Reading Room.

We have received from Mr. W. G. Brownson the second annual circular of the Cleveland and Pittsburgh Railroad Reading Room Association, of Wellsville, O. This enterprise has been quite successful, and during its second year has doubled its membership and greatly enlarged its library. The number of members is now 218. Three hundred and thirty valuable books have been added during the past year to the library, and every thing indicates healthy progress and increased usefulness. We trust that this organization may prove the parent of many similar ones. An intelligent corps of railroad employees gives character and security to the road they represent.

## Western Specimens.

OMAHA, March 31, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

That your readers may better appreciate Western literature, and the advantages the denizens of the prairies enjoy for a "high school" education, I send you the following extracts:

The first, from a "sharp" chap who inhabits the "gritty" locality of Whetstone, D. T., dated March, '69, is addressed to our worthy Superintendent, and reads as follows:

"Sir, I take this occasion to write to you for information concerning this Telegraph line that is a going to Rushin America. Mr. Hibberd, you will confer a favor on me by sending me the full particulars concerning this Expedition, and what salary they will pay a practical man, and how the officers in charge is, and what conditions they want a man to go on."

We advise him to arm himself with aboriginal petitions from our new possessions, and present himself to President Grant for a collectorship. He may be honest and "practical," if not competent.

Another is from that town in Nebraska where corner lots build capitals, and public squares abound with a profuseness Chicago might envy. It proposes itself to the "head telegraph operator of Omaha," and goes on to say the individual had written "concerning a birth in the office."

How he learned there had been or was to be a "birth" in our office, is questionable. However, such things are liable to occur. "I have had a slight experience in an office in the East; I would like to learn the trade." What, or which trade? He says, I like the business" (undoubtedly), "and want to know if you will take me in the office and learn me the trade, and let me know your charges. I am a clerking in a Dry Good store."

There's a chance for some of our sisters in the profession that should not be lost.

They may greatly conduce to their own happiness, and do the company a favor, by securing to it the unquestionable talent and skill the writer's Chinese hieroglyphical characters evince them to possess. Anna Dickinson was asked by a treasury clerk if she thought woman's sphere was in plowing, building houses, and shoeing horses? She replied, No, but she would have competent women occupying his place at the desk, and put him to shoeing the horses. We wonder if one of these chaps was the "operator" who sends in the following voucher: "For pewting to shows on hors, 120." But then a Western barbarian can't be expected to know much when a "shining light" at the "Hub of the Universe" asks, "Colorado! That's out here in Ohio somewhere, ain't it?"

TODD.

At a meeting of the British Association, the late Sir David Brewster exhibited a curious specimen of chalcedony, in the interior of which was a landscape minutely depicted. The landscape was evidently produced by the action of nitrate of silver, which had been insinuated through pores into the interior of the chalcedony. The most curious fact, however, about the specimen was, that the landscape entirely disappeared after being kept some time in the dark, but was restored again in a most distinct manner, after an hour's exposure to the light.

Acting upon the suggestion afforded by this specimen, he had induced a lapidary in Edinburgh to try the experiment of introducing a figure into the interior of a mass of chalcedony, by drawing it on a polished surface of the stone with nitrate of silver. The attempt was wholly successful, and the figure of a dog could be distinctly seen in the centre of the specimen.

## Atlantic Telegraph Company.

An ordinary general meeting of the shareholders was held yesterday, at the office of the company, in St. Helen's place; the Right Hon. Stuart Wortley in the chair.

The Chairman congratulated the shareholders on the much more cheerful aspect of their affairs than when they last met. Still, there was that about their concern which made it not the good investment it ought to be. The two cables were in a state of perfection. Their tariff of charges had been reduced, and the directors had before them the question whether they should not still further reduce those charges. They did a large commercial business, their average takings being £700 a day, but as yet they had not dropped into that large source of returns which social messages would furnish—messages between friends and relatives. The rate of income was sufficient to pay not only the claim of the Anglo-American Company on its £125,000 preference, but a dividend of something over 4 per cent. on the 8 per cent. preference stock of the company. He feared, however, that the 4 per cent. preference holders would have to wait some little time longer before they got a dividend. He advocated an amalgamation between this and the Anglo-American Company. It would, in his opinion, contribute largely to the prosperity of both companies. A special meeting would have to be called to consider the provision of means for security against accident to the cables. The Anglo-American Company had agreed to share, in this respect, to the extent of £12,500. He did not think the Franco-American Company would injure them much.

## Morning Religious Service by Telegraph.

SIR JOHN'S RUN, W. Va., March 9th, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

As my signature has been called for, I most respectfully "sign." I had several reasons for not signing in the November number. You hit on one; the others are perhaps foolish notions, not requiring notice.

In defence of my proposition, I will simply say: That prayer may need the sympathy of human voices on some occasions; but that sympathy is not essential. Else, how can we comply with the commands of the world's Redeemer—to enter into our closets, and after closing the door to the ear, the voice, and the world, pray to him who seeth in secret? What is prayer?

"It is the soul's sincere desire,  
Unuttered or expressed;  
The motion of a hidden fire  
That trembles in the breast,

Prayer is the burden of a sigh,—  
The falling of a tear,—  
The upward glancing of an eye,  
When none but God is near."

Hence, the sympathy of the human voice is not requisite; nor is it "adapted" to various seasons of prayer. Therefore, if this is the only objection, let us have prayer by telegraph. I am still under the impression, that much good will be the result of such action. That, if prayer is offered in this manner, with the true spirit of devotion, it will be a success; and we will be rewarded, not by man, but by Almighty God, whom we propose to adore with the assistance of the telegraph. Failure can only arise from formality without sincerity. The Book of Psalms, chapter cL, 3rd to 5th verses, says: "Praise him with the sound of the trumpet: praise him with the psaltery and harp. Praise him with the timbrel and dance: praise him with stringed instruments and

organs. Praise him upon the loud cymbals: praise him upon the high sounding cymbals." Had the telegraph existed at the time of writing, it is not improbable that the psalmist would have added: "and praise him with the telegraph."

We, as a people, are advancing in art and science. Let us not forget, that all our contrivances and discoveries, are things which "God has wrought." And we should apply all that is practicable, to the consummation of his service. Believing it practicable, I would urge this system of worship, especially for the benefit of those who are deprived of the privilege of assembling for public worship. Some are placed in wholly irreligious society, and are spiritually alone. Should they hear and offer prayer on the instruments with which they labor, they could more readily realize that other hearts are sympathizing with and praying for them, which would encourage them to persevere, and perhaps enable them to successfully resist the world's temptations. Should this system become a custom, who knows but many non-professors of christianity, who purposely absent themselves from public worship, will hear a petition that will cause salutary reflection.

I was pleased to read in the Journal of March 1st, the response of one Mr. George Jehur, advocating my proposition. I, and no doubt others, will be pleased to hear any objections, (if well founded) through the medium of the Journal.

Respectfully,

J. HOOD.

## The Coming Ship.

The "coming ship," as the intended rival of the Great Eastern is designated, has at present been exhibited, in model only, in San Francisco. It is to be of the same size as the Great Eastern, except that instead of 28 feet it will draw only 18 feet, and it will carry proportionately less tonnage. It is designed to carry four times as many passengers as any present style of ship, and substitutes for bunks regular beds; it will also give four times the space to a state room. The San Francisco Times says: The present mode of bunking passengers is unworthy of the age. Seasickness, if preventable by construction, should be rendered obsolete. This desideratum is attained in Thos. Silver's coming ship; it is secured by the proportions of the ship; and by their being 30 feet less of the hull out of the water than in the Great Eastern, but the motion is rendered almost imperceptible by a new device. The state-rooms, instead of being at the limits of the vessel, are amidships; that is, along the centre line of the ship, where the roll is scarcely perceptible. The saloon is to be 500 feet long, and clear of obstruction. It is not for dining. Instead of a public table, there are to be two competing restaurants at the extremities adjoining the saloons. The ship will sell passage only, the board being paid as meals are ordered. It is contemplated to carry second-class passengers and third-class in the same way. The present first-class bunks will be for third-class berths.

The telegraphic communication between France and England, experienced a severe trial during the tempest which occurred about the 10th of February, in the English Channel. The cables from Ostend and from Dieppe, were wholly interrupted; those from Calais and from Boulogne, communicated with England through but a single wire, consequently the dispatches interchanged between France and Great Britain were subject to very long delays.

The tempest of the 12th of February, completely stopped the working of the air lines, extending over England, Belgium, and the North of France.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, APRIL 11, 1869.

### The Union of Languages.

We have more than once referred to the tendency towards the adoption of a common language. Every year it becomes more marked. The ease and rapidity of travel which tend so much to the mingling of different nationalities, between whom some intercourse must be maintained, either directly by the acquisition of each others dialect, or through interpreters, is fast making that language prevail which most largely represents the world's activities. Who, then, are the great travelers of the world? Are not the English, the Scotch, the Irish, the American, found everywhere? All these speak a common dialect. America may be claimed as wholly English as to language. In all European cities the knowledge of it is a mercantile and social necessity. The language of India and Australia is English. The swarms of men and women from Germany and other European kingdoms to America all learn the English language in a year or more after their arrival. Many of these return to the fatherland and swell the increasing number of those who speak the Saxon idiom. It is the most widely spoken language on the globe. In compactness, in scope, in capacity of definite expression, in expressiveness, it is, with the aid of Latin, the king of dialects.

Potential among these unific agencies is the telegraph, by which the nations are placed practically together. To use it successfully the language employed must be terse, definite, clear. This is needed by considerations of time and economy. Words are wanted which express a whole definite idea, which need no adjective or descriptive accompanying index. For this the Saxon stands pre-eminent. No language can so tersely convey a thought, an order, a desire, as that which, in our conception, is the basis and beauty and power of the English language.

It is a curious circumstance, illustrative of what we have just written, that on the continent, not a few use the English language in their messages by telegraph, even where a foreign tongue prevails, because of this ability to condense language, increase its clarity and diminish its cost in transmission. Language is the manifestation of human thoughts and feeling by articulate sounds. In the use of the telegraph that language which utters most in a single word must prevail. The simple word "fire!" uttered by a frightened woman, sets all the bells of the metropolis in fiercest clang as soon as uttered. It is words like these that commerce will use to express its wants. They will be words everywhere recognized, in Pekin as at Marseilles, in St. Petersburg as at New York. Commerce will forge language, which the hunt for gold, and the energy of enterprise, will sooner or later establish as the idiom of the world.

Of course it will take time, but mark how rapidly the Saxon tongue spreads. We believe that 100 years will not pass away before a traveler will need no other language to interpret his thoughts in any town open to commerce in any quarter of the earth.

Inside of our Western civilization there are certain marked tendencies the result of which cannot fail to be a gain to Christianity and the world. From a variety of causes, all of which are in active operation, nations are becoming fewer but larger. The lesser are gradually being absorbed by the greater. Language is following a similar law, and evidence is not wanting to convince us that this tendency is destined to become even more a

characteristic of the future than it is of the present. A common nationality and a common language for all mankind is no longer an impossible dream. In proportion as this is realized so will the conquering forces of Christianity be multiplied, and so will its success be secured. The race will be to the swift and the battle will be to the strong; and in this great future the United States, the second home of the English tongue, will play a conspicuous part.

### Won it at Last.

At the recent gubernatorial election in Connecticut, Marshall Jewell was elected Governor by a decided majority and will soon enter into the duties of the Chair of State. This makes the third telegraph operator who has won his way to the front rank in public life within the past two years, viz: Governor Bullock, of Georgia, A. B. Cornell, Surveyor of the Port of New York, and Marshall Jewell, formerly operator on the southern line between Louisville and New Orleans, now Governor of Connecticut.

Mr. Jewell, since he left the telegraph service, has accumulated a handsome fortune, and by the excellence of his character and genial public spirit, has commended himself to the confidence of his fellow-citizens, receiving this distinguished mark of their consideration and respect. We have no doubt that these gentlemen will fill worthily all the posts to which the people have called them, and though neither of them may be ever exalted to the editorship of a paper such as it is our very good fortune to be, yet even in the comparatively subordinate spheres occupied by them, they may commend themselves to even this rare honor. Let all take courage and do their duty well.

### The French Cable.

The *Round Table*, whose comely face we greet weekly as our handsomest visitor, publishes an article on the secret history of the French Cable, which takes us by surprise. There is in it much particularity and some inherent evidence of truth, but we cannot accept the statement that this French enterprise is under the manipulation of the Atlantic Cable Company without better evidence of the reality of the statements made.

As a *bona fide* independent enterprise we have never regarded the French Cable as a promising investment. The Atlantic Cable is, indeed, what we have no doubt the French Cable will be, a scientific success. It has been a very moderate one as an investment. There is nothing, actually nothing, in its history thus far upon which to predicate a profitable rivalry. The present cables are far from being fully occupied. Every reduction of rates only causes a proportionate increase of business, without material increase of receipts. The profits, after a safe surplus for contingencies, have not averaged more than legal interest. The reduction of the rates one-half on June 1, to touch the social demand, if any exist, will possibly double the present business, but it requires more than a double business to preserve the present income. The reduction may possibly develop it, yet we have nothing in all this to prove the existence of a golden egg for a rival company, although it may prove a great public convenience and gratify a national pride.

### American Compound Wire.

We observe it stated that in the rigorous weather of the past month, on one of the western lines, that the steel or compound wire broke oftener than the ordinary iron wire, although claimed to be much stronger. We think this quite likely, and the cause is not difficult to arrive at. The iron wire is much larger and heavier than the compound wire, and even when drawn up well is seldom so taut as to be entirely straight. It is also tensile enough to yield to a considerable strain without breaking. When, therefore, the cold is great and contraction rapid, the curves of the wire, as well as its tensile qualities, relieve the strain without breaking. The steel wire, on the other hand, being smaller and lighter, is apt to be drawn to the condition of a straight line, and being rigid, has neither the curve nor the tensile qualities to compensate for contraction, and must break, though comparatively stronger than the iron wire. There are, therefore, conditions to

the use of this compound wire which must be respected. If of small size, it should either be erected in very cold weather, or left in curves sufficient to allow for contraction. Had the steel wire been as large as the iron wire, which we regard as the true thing to be done, we believe a different result would have followed, as then the curves of both would have compensated for the contraction, and the superior strength of the steel would have better borne the strain put upon it.

Of course the bare statement alluded to causes hesitation as to the value of the compound wire. We do not regard it as damaging if there be no greater objection. The contracting strain of cold will break any straight conductor. We confess to a desire to see the device successful. We are anxious to see added permanence to our structures. Public demands for perfection, reliability, promptitude, increase. Every aid to this ought to be welcome and valuable. We invite its makers to communicate to us any facts which may serve to illustrate its capacity and value.

### The Great American Paper.

#### POSTPONED.

From the JOURNAL OF THE TELEGRAPH of March 15th, we learn that the publication of the new paper which we announced some weeks ago, and in advance of all our cotemporaries, is for the present at least, postponed. We regret to record this intelligence. Such a paper would possess extraordinary facilities for obtaining news, and would gain at once a world-wide reputation. As the Father of the enterprise and of its announcement, our grief is keen and paternal. The JOURNAL pays us a meager tribute, as a scholar and inventor, which we should have valued still more highly had there not been an error made in our initials. Such is fame!—*Leavenworth Times and Conservative*.

It must have been the desire to perpetrate a pun upon the name of "Wildor," which made a big A stand in our memory as the great initial of our enterprising cotemporary's name. We regret it much. But it is not too late. It is not the first time a Daniel has come to judgment. We ask pardon of Daniel W. A. A. Wilder is a myth. It was A Wilder man, a poet of finer fancy than A. Wilder could ever have been, had he ever lived, or ever seized the pen divine. It was Daniel W. Put it down all ye recorders of current greatness. Daniel W. Wilder, editor of the *Leavenworth Times and Conservative*, originated the idea of a daily record of the continent's events, published in a mammoth daily, by an over-spreading Telegraph Company, gathered from 4,000 correspondents at 4,000 telegraph offices throughout this vast nation, or from 10,000 throughout the world! The idea is magnificent. It is a spark from off the anvil of a great intellect. All hail to thee, Daniel! The world owes thee some. It may call thee yet to be its editor. Its name will be the "WIDE, WIDE WORLD," edited by Hon Daniel W. Wilder. Amen.

### Still Another Popular Telegraph Man.

The Penn Valley Democrat has the following: "It affords us much pleasure to notice the re-election of our friend John Campbell to the office of Chief Burgess, of Carlisle, Pa., by a large majority. Mr. Campbell is one of the most popular men in Carlisle, as his election for four successive terms will attest—and the success of our ticket in that place is in great measure due to his influence and energy." All honor to the man who sent us a twenty pound turkey for our Christmas dinner! John Campbell, accept our congratulations. Carlisle knows itself, and therefore appoints you its Chief Burgess. We are not forecasting next Christmas, not a bit of it, although in memory of that turkey we feel much like the empty vase the poets talk about, in which "the perfume of roses abode in it still." Long life to you, and many bairns, and plentiful prosperity. May you never be without a turkey to your Christmas dinner.

M. F. CARRIE has described a new friction electrical machine which gives wonderful results, though but small in size. Above and parallel to the disk of glass, which turns slowly between two cushions, is another disk of non-conducting material, which acts by induction; the lower glass disk being the inductor.

## Foreign Notes.

The French cable is being made at an average of 150 miles per week, and the work of coiling into the hold of the Great Eastern is steadily progressing. At the latest dates some 1,000 miles had been taken on board.

The British and Irish Magnetic Telegraph Company have declared a dividend at the rate of 12 per cent. per annum.

It is expected that during the year 1889 7,200 miles of ocean cable will be added to the submarine telegraphs of the world. This increase will consist chiefly of the Franco-American cable, and the British and India Telegraph Company's cable to Bombay. These cables are estimated to cost £2,000,000 sterling, and will be laid by the British Telegraph Construction and Maintenance Company.

Latimer Clark estimates the electro motive force of the following batteries thus:

Grove.....	100
Bunsen.....	98
Marie Davy.....	76
Daniel.....	56

The British Electric and International Telegraph Company have declared a semi-annual dividend of 5 per cent., and an extra dividend of 4 1/2 per cent., making a dividend for the year of 14 1/2 per cent. free of income tax.

The prosperity of this company may be gathered from the fact that in addition to these generous dividends the reserved fund of the company amounts to £136,000.

The property of this company is reported as follows:

Miles of line.....	10,160
Miles of wire.....	50,309
Number of instruments.....	7,899

The increase during 1868 has been as follows:

Miles of line.....	153
Miles of wire.....	690
Number of instruments.....	664

## Pope's Modern Practice.

This important practical work of which we have already freely spoken, will be ready for delivery May 1. The advertisement of the author will give all needed information.

The work, judging from the index, which is all we have at present before us, is very comprehensive, and is no doubt accurate and valuable. Mr. Pope has had large experience, and is an educated engineer. We cannot err in commending the book to all who desire accurate knowledge in the art with which their life and labor are so much connected. It embraces nine chapters treating of batteries, magnetism, telegraph circuits, the American Telegraph system, insulation, line testing, construction, and general hints. Price \$1 50—for which we will send the "Modern Practice," post paid, to any who may desire it. See advertisement.

We will send a copy of the Modern Practice, free, to any one who will send us five new subscribers and five dollars.

## Prescott's History of the Theory and Practice of the Electric Telegraph.

A new and revised edition of this well known and standard American Telegraph work is offered to the public, and which we desire to see in the hands of all who value exact knowledge. It occupies a field somewhat different from Mr. Pope's, being largely historical and popular, and yet possessing in common with his, much valuable instruction and detail. They are well fitted in their several spheres, and by their treatment of the same subject to be companions to each other. Mr. Prescott's book has been so long before the public, and has been so highly appreciated both in America and Europe as to require little notice at our hands. As a telegraph statistician, the author occupies the front rank of American writers on that subject and to his pen is largely due the unanswerable and skillfully arranged testimony presented to Congress in the recent Postal Telegraph agitation. See advertisement.

We will send a copy of Prescott's History free to any one who will remit us eight dollars and eight new subscribers to the JOURNAL OF THE TELEGRAPH.

## Sales Western Union Stock.

Messrs. Fowler & Wells send us one of their characteristic volumes entitled "Hand book of Physiology, Phrenology and Physiognomy," illustrated. As a means of reading character it is highly instructive and entertaining.

The British Secretary of War has issued instructions that in future the superintendence of all of the working arrangements of the permanent military telegraph stations, both visual and electric, as well as of the construction of all military lines of telegraph, shall devolve upon the corps of Royal Engineers.

All officers of the corps and others who may be elected will be required to go through a course of instruction in the principles of electricity and the theory and practice of the telegraph in the national school of military engineering at Chatham.

The course of lectures the present year is to be on practical telegraphy, and will be delivered by R. S. Culley, Esq., Engineer-in-Chief of the Electric and International Telegraph Co. If these are sufficiently simple, and free from embarrassing algebraic terms, which usually place English telegraphic works beyond the conception of the ordinary operator, we may give our readers the benefit of copious extracts therefrom.

**WANTED.**—A copy of the pamphlet containing the proceedings of the 1st, annual, 2d annual, 4th annual and 8th annual meetings of the American Telegraph Confederation. Any of our readers having a spare copy will confer a great favor by forwarding the same to **GALVANI,** Care Editor JOURNAL OF THE TELEGRAPH.

## THE HISTORY, THEORY AND PRACTICE OF THE ELECTRIC TELEGRAPH:

BY GEORGE B. PRESCOTT.

Containing upwards of One Hundred Illustrations of

ELECTRICAL MACHINES,  
TELEGRAPHIC APPARATUS, ETC.

IN ONE VOLUME. 500 PAGES. PRICE \$2 50.

Your attention is respectfully invited to the revised and enlarged edition of the above work, written by one who has been engaged for over twenty years as a practical operator and superintendent of telegraph lines, and who is familiar with both the science and art of telegraphing. It is an accurate and exhaustive work on the subject it treats, interesting and valuable at once to the general reader, the man of science, and the practical telegrapher. It presents a concise and reliable history of the invention and progress of the

## ELECTRIC TELEGRAPH,

commencing with the first rude apparatus of Lesage, in 1774, and describing every subsequent improvement made in the art up to the present time. The subject is treated in a scientific, and, at the same time, in a popular manner, the style being divested, as far as possible, of scientific technicalities.

The author is confident that those who wish for a full, yet concise treatise of the

## ELECTRIC TELEGRAPH

will find in this work precisely what they seek.

Copies sent postpaid to any address, on receipt of the advertised price.

Address

GEO. B. PRESCOTT,

Sup't Sixth District W. U. Telegraph Co.,

Albany, N. Y.

## THE STANDARD AMERICAN WORK ON THE TELEGRAPH

Will be published May 1st.

## MODERN PRACTICE

of the

## ELECTRIC TELEGRAPH.

A Handbook for Electricians and Operators.

By FRANK L. POPE,

With sixty Illustrations.

This book supplies what has long been recognized as the great desideratum in American telegraphic literature. It is a

## THOROUGHLY PRACTICED TREATISE

And should be in the hands of every Electrician, Superintendent, Operator, Line Builder, Repairer, and Batteryman. It contains full descriptions and explanations of all the

## MODERN IMPROVEMENTS IN TELEGRAPHING,

Which have stood the test of actual experience. The construction and management of the different Repeater, Switches, etc., in use in this country, is explained at length. Full explanations are given of the most approved methods of testing lines and locating faults and interruptions upon telegraph lines, accompanied by numerous diagrams. The work also contains the new system of

## TESTING BY MEASUREMENT.

Which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines. The mode of working the

## ATLANTIC CABLE.

And the apparatus employed will be found fully described in this book. The appendix contains a large amount of useful and practical information, formulae, tables, etc., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever requisite, with

## ELEGANT ENGRAVINGS,

Most of which have been engraved expressly for its pages by the best artists.

## ALL TELEGRAPHERS

Who wish to inform themselves in regard to the construction and management of the various appliances used in telegraphing, such as

Batteries  
Keys,  
Relays  
Sounders,  
Registers,  
Switches,  
Lightning Arresters,  
Repeaters,  
Double Transmitters,  
Combination Locals,  
Insulators,  
Cables,  
Galvanometers,  
&c., &c., &c.,

Will find this just the work that is wanted.

Notwithstanding the great expense incurred in the publication of this work, in order to insure its general introduction, and to place it within the means of every telegrapher, relying upon large sales for remuneration, it will be issued at the low price of

## ONE DOLLAR AND A HALF.

On receipt of the price of the book, it will, if desired, be forwarded by mail, post paid, to any part of the United States or British Provinces. Orders should in all cases be accompanied by the money to insure prompt attention, and if sent by Post office order or registered letters, will be at the risk of the publishers. Orders may be sent to the editors of THE JOURNAL OF THE TELEGRAPH, or of THE TELEGRAPH; or to

F. L. POPE, Box 6, 138, N. Y. City.

Other agents will be hereafter announced.

## EDISON'S

## DOUBLE TRANSMITTER.

THE MOST PRACTICAL APPARATUS OF ITS KIND YET INVENTED.

Complete Sets (put up in working order), price \$400, \$450, \$500.

For further information, address:

THOMAS A. EDISON,

Care CHARLES WILLIAMS, JR.

Telegraph Instrument Maker,

109 COURT STREET,

## A Just Complaint.

## EDITOR JOURNAL OF THE TELEGRAPH :

I want to make a complaint. I am a manager of a branch office, and like many others take messages to collect at my risk—that is, if they cannot be collected at the other end. It is understood that I am to be at once notified and a chance given to collect the charges from the sender. Whereas, it sometimes happens that word is not sent me until by the error clerk to collect on messages sent three, four and six months back. Now a great many changes can take place during this interval. Senders change their residence, or say, "why not tell us before?"—or they at once refuse. Operators change; the original becomes covered up in piles of musty, dusty messages, and all the other annoyances. Now is there no remedy for this? Why should we not be notified at once, and not six months after. Yours, "134."

The complaint of "134," whose *nom de plume* carries us back a good many years when these cabalistic figures meant "what's your name?" is perfectly just and reasonable. When a collect message fails of collection, it should be reported at once, or the responsibility be transferred from the sender to the receiver. There is both justice and honor in this, and no right-minded man will be willing to hazard the loss of an amount, however small, to his brother officer by delay.

As to the limit which should be allowed for collection, it may be difficult to decide. At places adjacent, we do not see why it should exceed a single day, or even part of a day; and there are no places so distant as to make a delay of a week necessary except under

very unusual and seldom recurring circumstances. In case of neglect to give notice within these periods, we believe it only just to charge the uncollected amount to the manager who has failed to perform a very clear and usually faithfully performed duty.

## New Mode of Repairing Cables.

GRAFTON, W. VA., April 2d, 1869.

## EDITOR JOURNAL OF THE TELEGRAPH :

DEAR SIR—Every one who has had anything to do with telegraph cables knows the difficulties and annoyances which attend the making of joints, especially in disagreeable, or cold and windy weather. If we use hot water, as was at first the custom, the chances are that by the time we get the water out of the pot and pour it over the joint, it is too cool to make the gum adhesive enough, and in pouring it on we run the risk of injuring another sound joint, or part of the cable, by the waste water running off. If we use the hot iron, it is often very difficult to get exactly the proper heat and no more applied, especially in cold and windy weather, and if we attempt to manipulate the melted gum (melted in this way) with the fingers, in order to insure perfect adhesion, we are apt to have it stick to them and come off, thereby spoiling the joint.

Having found, by experiment, that the gutta percha at a temperature of 212 degrees will become plastic and adhesive enough to make a reliable joint, I have lately contrived a little arrangement which enables me to apply this degree of heat with ease and certainty, and to each joint separately (where there are several conductors) without interfering with the others.

I take a common iron pot, such as is used in cooking stoves, holding, say three gallons, and have a tin cover fitted on it *very tightly*, and so arranged that it can be tied down securely with wire. In this cover is inserted a tin tube about three eighths of an inch in diameter and six inches long, standing upright about one inch from the edge of the cover. On this tube is slipped the end of a piece of half inch india rubber tubing as long as convenient, (say four or five feet) to the other end of which is attached a small tin nozzle, made tapering, so that the large end will just receive the tubing, the small end being contracted to an eighth of an inch in diameter. We have now a miniature steam boiler, and if the joints are all good, and the pot (about half full of water) placed on a briar fire of *hard wood* chips, a powerful blast of hot steam will be delivered steadily from the nozzle.

To use the apparatus, build a fire about four feet from the joint to be made, (if it is necessary to have it more distant, the tube must be lengthened accordingly) put on the pot and make it boil *briskly*. Having softened a *small* piece of gutta percha in the steam, apply it to the joint so as to form a *thin* coating all around it. Then, holding the steam pipe in the left hand, direct the jet of steam against this covering, and *particularly* at the two points of junction of the original covering with yours, until the whole is soft and sticky. Then, laying aside the steam tube, work over the gutta percha *thoroughly* with the finger and thumb of each hand until it forms a perfect coating in which no seams or cracks can be found, taking particular care that at its junction with the original covering, the two are perfectly cemented together.

The coating thus finished should be about half the size of the original one, provided a neatly soldered splice is made in the conductor, as it should be. This done, take up the steam tube, and without applying any more gutta percha, melt the whole surface over again, but not enough to make it run, and then work it over as before. If you have done everything right two heatings will be enough; but if there is the slightest doubt about it, re-heat the covering again and again until perfectly satisfied it is perfect.

You now have your first coat on, but you require two coats more which you apply separately, in the same way as the first. It is very important that each coat should be perfect of itself. In joining your covering with the original one each coating should extend about a quarter of an inch beyond the preceding one.

While working the gum with the fingers it can be kept constantly melted by the steam jet, as it is always ready and always hot, and this is its great advantage. When the whole joint is finished the covering should be but little larger than the original one, as a large body of the gum is not desirable. After the joint is made in this way, those who prefer it may melt over the surface with a hot iron, but I do not find it necessary. G. S.

## Electrical Flying Fish.

The experiment of the "flying fish" has excited attention in Paris. M. l'Abbe Laborde and M. Saleron have both written to "Les Mondes" on the subject. Each suggests making use of the conductor of an electrical machine in place of a charged Leyden jar. M. l'Abbe Laborde says, in the following manner the experiment can be easily made by any who possesses an ordinary electrical machine: A piece of gold leaf or silvered paper is cut into the shape of a kite; this is then placed on the conductor of a machine, and a ball connected with the rubber slowly approached to the blunt end of the leaf. Soon the leaf rises and springs from the conductor, remaining however in the air between it and the ball. The finger can be substituted for the ball, and the leaf led even vertically round the conductor with a considerable intervening space. The distance of the leaf from the rubber almost entirely depends upon the size of the blunt angle,—the more obtuse this angle, the nearer the leaf approaches to the rubber. The explanation given by M. l'Abbe Laborde is, that the point presented to the electrified body, receiving electricity of the same name, is repelled, which it would be altogether, were it not that it parts with its electricity by the other point, can be again attracted to the electrified body, and is again repelled. Thus repulsion takes place in approaching the conductor, because it receives more than it loses; but immediately attraction ensues, because now it loses more than it receives. The equilibrium between these two opposing forces enables the gold leaf to maintain itself in the air at a distance from both solid bodies.

Mexico is gradually putting herself in the condition of advanced civilization. Work has been commenced on the telegraph line between the city of Mexico and Tampico. The printers in the Mexican Capital are organizing a Typographical Union, and the government are daily expecting the arrival of the newly appointed minister from the German Confederation. All these indicate a healthy condition, the infusion of a little of the Yankee energy, and the gradual recognition of a much cursed people into the ranks of civilized and advancing nationalities.

THE average cost of repairing the cables in the British Channel is £3,000 per annum. The year now about ending will show an increased cost in this department, storms having been frequent and severe, causing vessels to drop their anchors for safety when driven towards the shore, and thus injuring the cables. At one time only one cable was in use, although they are numerous and laid on various routes.

SOUNDS.—Josh Billings was asked, "How fast does sound travel?" And his idea is that "it depends a good deal upon the noise you are talking about. The sound of a dinner horn for instance, travels half a mile in a second, while an invitational *tew git up* in the morning I hev known to be three quarters of an hour going 2 pair of stairs, and then not hev strength enuff left to be heard."

**To the Public.**

We call attention to the following, and hope it may lead to the recovery of the property

**STOLEN**

on the night of the 7th of April:

Western Union Telegraph Coupon Bonds, numbers and denominations as follows:

No. 17, - - - -	\$600.00
" 48, - - - -	600.00
" 187, - - - -	500.00
" 188, - - - -	500.00
" 189, - - - -	500.00
" 208, - - - -	500.00
" 842, - - - -	500.00

The public are cautioned against purchasing these Bonds, or the Coupons therefrom, as payment has been stopped.

Parties to whom they are offered are requested to hold the same and notify me; and if offered by persons unknown, or under suspicious circumstances, then to detain the parties offering the same until notice can be given to me.

A reasonable reward will be paid for their return to the owner.

WM. HUNTER,  
86 Liberty street, N. Y.

**IMPROVED TELEGRAPH WIRE.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

**THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

**GREAT AND UNIFORM STRENGTH,**

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
APRIL 15, 1899.

To all Offices on W. U. Lines:

The following changes have occurred since March 15, the date of the last tariff order. Please note them in your tariff book:

**NEW OFFICES.**

Birmingham, Conn., reopened, tariff same as heretofore.  
Bloomfield, Iowa. Offices heretofore known as "Caton offices" will use the "map tariff." All other offices will add 95c. to St. Louis, 95 to Omaha, or 115 to Chicago, taking as the tariff the lowest amount found after adding as directed.  
Brenton, Ill., tariff same as Chatsworth, Ill.  
Corrinne, Utah, tariff 100 more than Salt Lake, Utah.  
Cummingsville, O., same as Cincinnati, O.  
Offices having "special rate" to Cincinnati will adopt it as rate to Cummingsville, O.  
Hellerton, Pa., tariff same as Bethlehem, Pa.  
Lamokin, " " " " Chester, "  
Letohatchee, Ala., reopened, tariff same as heretofore.  
Lexington, Scott Co., Ind., tariff same as Seymour, Ind.  
Montville, Conn., tariff same as New London.  
Salem, N. H., reopened, tariff same as Methuen, Mass.  
Speaksville, Tex., tariff same as Austin, Tex.  
Yongsboro, Ala., tariff same as Opelika, Ala.  
York, Ala., reopened, tariff same as heretofore.

**NEW OFFICES ON OTHER LINES.**

Bamapo, N. Y., tariff same as Suffern, N. Y.  
Riddlesburg, Pa., summer office, tariff 30 and 3 from Huntingdon, Pa., check Huntingdon.  
Shenandoah City, Pa., tariff 30 and 2 from Mauch Chunk, Pa. Check Mauch Chunk.  
Cincinnati Furnace O., tariff 75 and 6 from Cincinnati; or 30 and 2 from Chillicothe, or 65 and 4 from Marietta. Check that office via which the business is sent

**OFFICES CLOSED.**

Burlington, Ind.; Lauderdale, Miss.; Rulo, Neb.; Tupelo, Miss., and Bennetts Sta., Ala.

**TO OFFICES HAVING "SPECIAL SHEET A."**

Hereafter to obtain tariff to the following offices you will add, to your "special rate" to Columbus the rates given herewith:

Lockbourne, Ohio.	25
Circleville, "	40
Chillicothe, "	40
Waverly, "	40
Pikeston, "	40
Portsmouth, "	55
Ironton, "	55
South Point, "	70
Gallipolis, "	70
McConnellsy's, "	55
Beverly, "	60
Lowell, Washington Co., Ohio.	60

Rate to Easton, Bethlehem and Allentown, Pa., will hereafter be 25c. more than "special rate" to Philadelphia; and Scranton, Wilkesbarre and Mauch Chunk, Pa., 35c. more than "special rate" to Philadelphia, or to New York, if your rate to that point is lower than to Philadelphia.

Rates to the following points will hereafter be made up by adding to your "special rate" to Oswego the rates given herewith:

Adams, New York.	25
Adams, Center "	35
Brownsville, "	35
Cape Vincent, "	25
Carthage, "	35
Chaumont, "	35
Clayton, "	25
Deer River, "	35
Dexter, "	35

Lowville, New York,	35
Mannsville, "	35
Martinsburg, "	35
Pierrepoint, Manor, "	35
Sandy Creek, "	35
Turin, "	35
Watertown, "	25

Tariff to Georgetown, D. C., has been made 10c. more than "special rate" to Washington, D. C. (This is an exception to the rule laid down in "note" in Journal of March 15th.)

Tariff to Grinnell, O., same as "special rate" to Piqua, O.  
" " " " " " " " Dayton, O.

**GENERAL INFORMATION.**

Business for the following offices on the Central Pacific R. R., will hereafter leave W. U. line at, and be checked to, Reno, Nev., tariff as indicated:

Argenta, Nev.,	From Reno,	\$1 75
Battle Mountain, Nev.,	"	1 75
Browns, "	"	1 00
Carlin, "	"	1 75
Elko, "	"	2 00
Hot Springs, "	"	1 00
Humboldt, "	"	1 00
Humboldt, Wells, "	"	2 50
Independence, "	"	2 50
Lovelicks, "	"	1 00
Mill City, "	"	1 25
Oreana, "	"	1 00
Pike, "	"	2 25
Wadsworth, "	"	75
Winnemucca, "	"	1 50

The above rates are for ten words. Rate for each additional five words, or under, fifty cents.

The tariff to Reno is \$3 75 from Omaha, Neb.

Tariff to Centralia, Delano, Hazleton, Mt. Carmel, Penn Haven, Quakake Juno, Tunkhannock and Weatherly, Pa., on the Lehigh Valley R. R. line, will hereafter be 30 and 2 from Mauch Chunk, Pa. Business for these offices will be checked to Mauch Chunk.

On and after May 1st, all business with the Chicago, Alton and St. Louis; Terre Haute, Alton and St. Louis; and the Ohio and Mississippi R. R. Offices at East St. Louis, will be checked with St. Louis office and at St. Louis rates.

The tariff to Hyde Park should be same as Scranton, Pa.

The name of the office heretofore known as Chicago Junction, Ill., has been changed to Englewood, Ill., and Checaqua, Iowa, to Rome, Iowa.

**BUSINESS WITH MONTREAL TELEGRAPH COMPANY.**

In Journal of March 1st, offices which had formerly sent and checked business for Province of Quebec, (C. E.) to New York City, were directed to send and check it to Rouse's Point, N. Y. On and after May 1st, prox., business, both ways, between such offices and Province of Quebec, will be sent and received, via New York, as before, but will be checked to "Montreal Junction" instead of Rouse's Point.

This Company's tariff will be the existing tariff to New York plus 55 cts. from New York to "Montreal Junction"; the Montreal Company's tariff will be 20 cts., currency, from "Montreal Junction" to Montreal, plus tariff from Montreal to destination of message as per Journal of January first. For example:

**TARIFF FROM WASHINGTON, D. C., TO QUEBEC, QUE.**

For this line Washington to New York,	\$ .40
New York to Montreal Junction,	.55
Total for this line	\$ .95 cur'ncy
For Montreal line, Montreal Junction to Montreal	.20
Montreal to Quebec. 25 cts. gold	.35
Total for Montreal line.	\$ .55 cur'ncy
Total tariff, Washington to Quebec	\$1 50, of which the tariff for other lines is 55c. currency.

All offices which have heretofore checked Rouse's Point on business with Montreal Company will, on and after May 1st, check "Montreal Junction." This includes offices of 4th District, Supt. Gates, and all offices sending or receiving Canada business over his lines. Should any business be exchanged at Rouse's Point when direct Montreal line is down, or from any other cause, Rouse's Point will report to Montreal, and "Montreal Junction" will be checked thereon.

WILLIAM ORTON, President.

# Journal of the Telegraph.

## Our Sun the Origin of all the Forces on Earth.

[From the Scientific American.]

When we trace backward the origin of all the forces or motions on the surface of our planet, we come to the necessary conclusion, that they all, with the single exception of the ocean tides, are to be found in the heat of the sun. In fact, this heat causes air currents, and so the force of the wind; it evaporates the water of oceans and lakes, which, coming down on mountains as rain, forms streams, and gives water power in its descent. Again, this heat of the sun causes plants to grow, which, storing up heat in their fibers, procure us a fuel, either fossil as coal, or recent as wood; which fuel, by its combustion, gives us only the heat of the sun back, which heat is thus made available to us at any place, at any time, and is also easily transformed into motion by means of steam or caloric engines. Or, again, the vegetable matter formed by the light and heat of the sun, is consumed by animals as food; and the stomach of animals acting in certain respects like the furnace of a steam engine, sets partially the hidden heat free to keep the animal system at the proper temperature, and partially consumes this heat to produce muscular motion for moving the individual itself, and partially this muscular motion may be applied to produce motion of matter, overcoming all kinds of resistance to this motion, and this last is what is commonly called force.

The use of a number of pounds only, as a measure of a force, without referring to its motion, notwithstanding extensively applied, is, when critically examined, very erroneous; as is also the old definition of force as something which "can create or destroy motion of matter," as if force was something exterior to matter and independent of it.

Force, on the contrary, is the manifestation to us of something co-existent with and inseparable from matter; no force without matter, and, as far as our experience goes, no matter without force.

Matter shows itself to us under different forms, and continually undergoes the most stupendous transformations by chemical and other agencies. Sometimes a light, invisible gas like hydrogen becomes condensed without any external pressure, in the one-thousandth part of its former space, in the metallic state in palladium, increasing the weight of this last metal almost one per cent; or this same gas combined with another gas, nitrogen, making the mysterious metal ammonium, forms a perfect amalgam with mercury, swelling its bulk till it becomes lighter than water, and will float on it.

Similar transformations we observe in force: one time it will manifest itself to our eyes as light streaming from the sun; then as an agent expanding matter, and giving to our bodies the sensation of heat; then changing the solidity of ice into the fluidity of water, and this again into the highly elastic vapors or steam—by every one of these molecular changes, a portion of heat disappearing, becoming latent, to reappear again when another change occurs in the opposite direction. By not only overpowering and destroying the natural cohesion of the waters molecules, but changing it in a powerful repulsion, this force increases the bulk of the water more than a thousand times, and enables it to exceed not only pressure, but to move heavy bodies; thus we may transform molecular force, or heat, into motion of the masses which then is distinctly observable to most of our senses. This constitutes what formerly, exclusively, was called a force.

P. H. VANDER WEYDE, M. D.

**WITHOUT SLEEP.**—Five young men in Berlin lately made an agreement, for a wager, to see who of them could keep awake for a whole week. They all held out for about five days and a half, by drinking largely of strong coffee, and keeping up a constant round of active exercises and exciting amusements. At the end of that time two of them yielded to drowsiness; a third soon fell asleep while riding, tumbled from his saddle and broke his arm; a fourth was attacked by severe sickness, and compelled to retire from the list; the fifth held out to the end, but lost twenty-five pounds of flesh in winning the wager. Long ago, Frederick the Great and Voltaire made a similar experiment, but they did not succeed.

### SPECIAL NOTICE,

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York.

The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES;

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDICT BROTHERS,

No. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH

Watches Repaired in the most thorough manner, and Warranted.

### SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDICT BROTHERS,

Agents for the American Waltham Watch.

691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1882.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

### SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

### THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

### THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

### MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

### THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Rathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH OF Dec. 15, 1882.

Goods sent to all parts of the Continent with bill C. O. D. Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,  
Office and Factory 86 Nassau Street,  
New York City.

**SHAWK & BARTON,**

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES.

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonised Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.,	&c.	&c.

We continue to manufacture Instruments after the favorite

WESTERN UNION STANDARD PATTERNS,

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

COMPLETE OUTFIT OF ELECTRICAL APPARATUS,

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

NO. 98 ST. CLAIR STREET, CLEVELAND, O.

G. W. SHAWK,

E. M. BARTON.

**BISHOP'S PATENT**

BALATA INSULATION

FOR TELEGRAPH AND ELECTRIC WIRES.

We are now prepared to furnish wire insulated with this new and valuable material, which, from the time in which we have had to test its merits, proves to be

VERY TOUGH AND PLIABLE,

WILL NOT BECOME BRITTLE.

WILL NOT CRACK,

IS NOT EASILY AFFECTED BY EXPOSURE TO THE WEATHER,

AND

IS A PERFECT INSULATOR.

Any size or style of Wire made to order at short notice by the only manufacturers,

THE BISHOP GUTTA PERCHA COMPANY.

SAMUEL C. BISHOP, General Agent,  
118 Liberty street.

**STICKWELL & CO'S**

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Smoulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

*Stickwell's Mucilage is KING of the Market. No other brand sells as well.*

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

**CHARLES WILLIAMS, JR.,**

109 Court Street,

BOSTON, MASS.,

MANUFACTURER OF

TELEGRAPH INSTRUMENTS,

BATTERIES,

AND MATERIALS OF ALL KINDS.

WM. KIDD,  
A. BOODY.

O. H. PEIRCE,  
O. S. OTIS.

KIDD, PEIRCE & CO.,

BANKERS,

19 BROAD STREET AND 57 EXCHANGE PLACE,  
NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

S. S. STAFFORD'S COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 83¼ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

**A. S. CHUBBUCK,**

HOTEL STREET,

(Adjoining the Post Office,)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

**CHAS. T. & J. N. CHESTER,**

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS,

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**CHESTER, PATRICK & CO.,**

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

38 SOUTH FIFTH STREET.

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be intrusted, whether for the construction of any or all lines of telegraph, or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closers.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

**L. G. TILLOTSON & Co.,**

**DR. L. BRADLEY,**

NO. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

WHOLE NO. 36

## A New Magneto-Electric Machine.

[From the Student and Intellectual Observer.]

Many ingenious contrivances have been used for the production of electric currents from permanent magnets. The general principle of the construction and action of such apparatus is as follows:—

A bar of soft iron is made to revolve with great rapidity in front of, or between, the poles of a permanent magnet or magnets. On the bar of iron, or revolving armature, is wound a quantity of fine copper wire, insulated with a covering of silk. Motion is communicated to the armature by some arrangement of multiplying wheels. Every time the direction of the armature is changed relatively to the poles of the permanent magnet an induced electric current is generated in the coil of insulated wire surrounding it, the current being reversed in its direction twice in the course of each single revolution of the armature. The reason of this reversal will be understood when the cause of the production of the electric current is more fully explained.

Faraday demonstrated the production of an induced electric current by the action of a permanent magnet by the following beautifully simple experiment. A coil of insulated copper ribbon, about forty feet long, was wound in a single flat coil, like a chronometer spring, round a soft iron rod. The end of the ribbon was drawn out of the centre of the coil, and soldered to a small plate of copper, stouter than the ribbon. One surface of this plate was amalgamated with mercury. The outer end of the ribbon was pointed and bent in the form of a letter S, so as to act as a spring and rest lightly on the amalgamated plate. The iron rod on which the coil was wound was placed on the poles of a powerful permanent magnet, supported in a vertical position. Thus placed, the rod became itself a magnet by induction, and generated an induced current in the coil of insulated copper ribbon wound upon it. Induced currents being instantaneous, are only present at the moment of making and breaking contact between the bar and the magnet. When the contact was broken with a sudden jerk, the spring end of the ribbon flew up from off the amalgamated copper plate on which it rested, and deflagrated a portion of the mercury, producing a small bright spark. On reversing the ends of the bar relatively, it becomes an induced magnet with its poles reversed, and the current induced in the ribbon will run in the contrary direction. If instead of fifty feet of copper ribbon, we wind fifty yards of fine insulated wire upon the iron rod, and attach the rod by its centre to an axis at right angles to itself, as well as to the poles of the permanent magnet, and bringing the two opposite ends of the fine wire into contact, by means of springs with two separate pieces of metal, upon touching both pieces of metal, while the axis is rotating, a strong electric current will be felt.

Machines of this kind, as usually made, are only powerful enough to produce physiological effects. Those which have been made powerful enough to exhibit effects similar to voltaic batteries or plate glass

electrical machines, have been so cumbersome and expensive as to preclude their coming into general use.

Mr. Browning, of the Minories, has just introduced a magneto machine of novel form and arrangement, in which the disadvantages of the old machines have been completely removed.

In the engraving, A A are two permanent magnets, of a similar form, whose poles at the lower part nearly approach, and actually face, each other. B is an armature of soft iron, round which a quantity of insulated copper wire is wound lengthwise. The armature is made to revolve with great rapidity by the following ingenious arrangement. The handle in front of the instrument communicates motion to the cog wheels at C, which are a modification of Watt's celebrated sun-and-planet-motion. The wheel D moves with cog wheels, and being attached to a hollow ar-

bor through which the spindle passes, to which the handle is attached, it makes six revolutions for one turn of the handle. The rim of the wheel D gives a multiplied motion to the armature B, which is thus caused to revolve nearly thirty times for every time the handle makes one revolution.

The ends of the insulated wire on the armature are connected with the two brass balls in which the wires marked E are fixed. A commutator, which cannot be seen in the engraving because it is behind B, controls the connection, in such a manner, that all the positive currents are sent to one ball, and all the negative to the other.

Two armatures are supplied with each machine, one containing a few yards of insulated wire of large size. This is known as the quantity-armature. The other armature contains a great length of exceedingly fine insulated wire. This is the intensity-armature. The quantity-armature produces effects similar to those produced by a voltaic battery; the intensity-armature such results as are obtained by means of an electrical machine.

With the quantity-armature the following effects can be produced:—Half an inch of platinum wire placed between the poles at E, can be made white hot in a few seconds. An induction coil may be made to give off bright sparks, or illuminate small induction-tubes. Bells may be rung, or telegraphs worked, even at a distance of many miles. Water or chemical salts may be decomposed.

With the intensity-armature, Abel's fuzes may be fired, and most powerful physiological effects may be

produced. The power of the shock-current may, however, be modified to any extent at the will of the operator, so that it may be made quite unbearable, or scarcely perceptible, as desired.

The decomposition of metallic salts under the microscope is a singularly beautiful experiment. It is only necessary to place a small quantity of a metallic salt, such as sulphate of copper, nitrate of silver, or acetate of lead or zinc, in solution, in a hollow glass cell on the stage of the microscope; then bring the ends of the wires from the machine, and dip them into the liquid. Upon turning the handle of the machine, the salt will be decomposed, and the metal will be deposited in the form of crystals upon the end of the wire forming the negative pole.

If the current from the quantity-armature be sent through a short coil of stout insulated wire, wound round a rod of soft iron, bent into the shape of a horseshoe, the iron becomes a magnet, and will support a weight attached to its feeder. Here we see the permanent magnetism of the magnets make the revolving armature an induced magnet. The interruptions in the magnetism of the armature, caused by its revolution, induce a current of electricity in the wire wound upon it; and the passage of this electric current through the coil of wire on the soft iron horseshoe converts the iron bar into an induced magnet.

The machine we have described moves with very little friction, is very compact and portable, and is comparatively inexpensive, being less than one third the price of the old machines of equal power. With the intensity-armature a most powerful and intense current is produced. The current is completely under control, and, as we have said, can be modified at pleasure, so as to be applicable for medical use. By an ingenious arrangement of the commutator, the current is made to flow continuously in one direction. Dr. Richardson, F.R.S., so well known for his most valuable method of using ether-spray for the purpose of producing insensibility to pain, instead of administering chloroform to patients about to undergo surgical operations, states that he has used this magneto machine with great success.

For any purpose, the effects of a moderately powerful voltaic battery may be produced, without the trouble and inconvenience attending the use of batteries. The instrument is elegant in appearance, and always ready for instant use.

ELECTRO-PLATING iron with copper and brass is successfully carried on in France, in the following simple manner: The iron object is coated with a varnish of rosin, dissolved in benzine. This is then coated with plumbago, and the copper deposited as usual. By this means the peeling off of the thin layer of copper is obviated.

A THEORY OF THE AURORA BOREALIS.—The New York Journal of Commerce submits and argues an original theory to explain the phenomena of the Aurora Borealis, to the effect that the Aurora Borealis is the silent discharge of accumulated electricity in the atmosphere, furnishing the same relief to nature as flashes of lightning under other conditions.

### The Great Auroral Display.

The effect of this magnetic storm, which occurred April 15th, was marked and unusually prolonged. It had appeared on the telegraph lines leading north from New York at an early hour in the afternoon, and, at an hour or two later, on the lines eastward. But it was not until 7.30 P. M. that any peculiar vigor was manifest. At that hour it affected the wires leading from New York to Boston like two antagonistic batteries of great power on a short circuit, bending over the armatures of the magnets with great agitation and violence. At first it was supposed the disturbance was caused by wires fouling, but the peculiar appearance of the sky drew several operators to the roof of the telegraph building, when a large segment of the lower portion of the horizon from N. W. to S. E., was found to be of a bright yellow, which half an hour afterwards changed to pink, at the same time that splendid flashes of light darted up in silent grandeur towards the constellation *Lee*, terminating there in a beautiful oval corona.

From 7.50 to 8.10 P. M. the auroral current on the wires was very strong, and was used between New York and Boston instead of the battery in forwarding business. Washington could be reached as well as Pittsburgh by the same means, but with a much weaker and inconstant auroral current. At 9 P. M. the auroral current was weaker, and so remained until 10.30, when it became stronger. At 11.15 it again declined. At 11.30 it became very strong. At midnight it became weaker but steadier, and all the Boston Press matter was sent by the auroral current. At no time, from 7.30 to midnight, did the auroral current so fail on the eastern wires as to prevent the transmission of messages. It was attempted to use them north, but failed. It was used for a short time on the Washington wires, and Philadelphia used the auroral current to Pittsburgh.

In a still summer night, upon one of our great northern lakes, and more especially upon Lake Superior, the Aurora Borealis can be seen in great perfection. Floating in a small boat, remote from the shore, one seems to be enveloped in the meteor as in a fog. Nothing is visible but the unearthly light strangely flickering, appearing here and there, filling the whole atmosphere, and keeping it all in tremulous movement. The effect is bewildering. One's ideas of space, distance, progress, and direction, are as confused as if floating among dense clouds in a balloon. The lights, at times, assume various colors, as different shades of orange, green, gray, and red. When they meet at the zenith and form a corona, this has been seen of green, blue, and purple colors. The red tinge has been known to overspread a large portion of the sky, giving to it the color of blood. Such appearances in ancient times were regarded with great horror. The streamers of light are converted by the imagination into the forms of familiar objects in motion. The inhabitants of the north of Scotland call them merry dancers. The ancient Greeks and Romans regarded their appearance as portentous of great events and saw in their varying forms,

Fierce, fiery warriors fight upon the clouds  
In ranks and squadrons, and right form of war.

Henderson remarks that in Iceland, where the coruscations are particularly quick and vivid, a crackling noise is heard, like that of the sparks emitted from an electrical machine. Blagden, Gmelin, Nairne, and Cavallo, all speak of the sound proceeding from the aurora. In the chronicles of the middle ages it is frequently recognized in the superstitious descriptions of the gleaming swords of the fighting aerial hosts.

Prof. Olmsted estimates that the height of the corona above the earth is between 70 and 160 miles. Other

observers have found the auroral display much lower, and approaching, indeed, very near to the earth's surface. The cause of the phenomenon is ascribed to the plunging of the earth through nebulous vapor, the velocity being sufficient, notwithstanding the rarity of the materials, to develop this luminosity. Biot and Dalton explain the magnetic phenomena by supposing that the vapor is metallic, probably ferruginous.

An enthusiastic correspondent of the *N. Y. Sun* writes as follows:

As we looked up to the zenith, where the planet Mars was beginning to glow in the pale blue-green of the twilight sky, we observed faint lines as of thin vapory clouds running from the north and west toward the zenith. Soon the white streaks increased in number infinitely, rising up in all directions from the horizon and forming a cloudy fan-like corona around Mars, which gazed down like the All-seeing Eye through the glorious canopy. Suddenly pulses and waves of soft light would tremble and shiver through the sky, breaking the electric beams into new forms, fading there and brightening here, undulating with a perfect music of motion. Then, while the northern sky was of a pale white, and the western horizon of the loveliest apple-green, broad flushes of the most exquisite pink moved up in the heavens, changing to lilac, and deepening at times to crimson, while simultaneously were seen belts of rich orange and yellow. Glorious beams of light shot up at intervals from the north, and almost from all points of the horizon; broad fans of the electric clouds filled the air with a faint brilliancy. The wondrous pageant kept incessantly changing; it was all motion, all variety, white light alternating with the most exquisitely toned and richest colors.

And all the wondrous display going on in perfect silence; no noise or crackling, no explosions or thunder; all done so grandly in the sublime stillness which reigns in the infinitude of the universe.

At about 11 o'clock there was a second display, more beautiful for the brilliancy of the white light, but not showing the colors which so rarely accompany the Northern Lights in this latitude. The electric clouds took the forms of several of the great nebulae, thus presenting those remarkable objects, as it were, on an enormous scale, an effect truly beautiful and wonderful.

### Teaching Girls the Art of Telegraphy—They are Apt Students.

From the San Francisco Chronicle.

The school for the instruction of women in telegraphing, at our Cooper Institute, flourishes so promisingly, that it seems quite unlikely that male operators can hold out much longer against their smiling rivals in that branch of industry. The school is under the control of the Western Union Telegraph Company, and twelve ladies at a time are taught the art and mystery of manipulating the wires by Miss Snow, a preceptress highly accomplished, and apparently an enthusiast in her profession. I dropped into this school a few days ago, and speak from personal observation when I say that I think it opens for the sex a new field of enterprise that cannot but prove a profitable, as well as an extensive one. There are certain positions in the world of business and trade for which women are eminently qualified, and there is no valid reason why they should not occupy them. As clerks in stores, as bookkeepers, as telegraph operators, as compositors or type-setters, and so on, they can earn a remunerative sum, and can accomplish as much as their masculine rivals, who are fit for more robust employments. At this school of telegraphy no girl under seventeen, and no woman over twenty-four years of age, is received as a pupil. They are all taught gratuitously, and all have to pledge themselves in advance to accept situations away from the city when offered to them. As situations are bestowed on the capable ones which return from fifteen to thirty or more dollars a week, the pupils have a cheerful prospect before them, and hence the number of applications for seats in each far exceeds the capacity of the school at present. The girls are, as a body, remarkably apt in the acquisition of this art, and will ultimately make a mass of sober, steady, quiet, practical and expeditious operators for the rural stations, whence they can be gradually drawn, as they become perfect, to fill situa-

tions in the city now occupied by men who devote too much time to smoking, drinking, and frolicking generally, to be considered reliable employees. I should not be surprised to find ordinary places of trust all filled by women before long. They are safer cash-keepers than men. Even when dishonest, they cannot steal as much and as successfully as men. They cannot so readily waste money in cigars and wine, on horses and dogs, and in debauchery. They cannot so easily invest stolen funds without detection; and, at any rate, they have more fidelity, more patience, more tractability. Their capriciousness and volatility can be cured by business discipline, and hence they can, in time, be made valuable assistants in many a light position. Let the women rejoice therefore. They have a brilliant era approaching.

### A Beautiful Passage.

Artesian wells are sunk through the sod of the prairies, through the loam, through the gravel, through the hardpan, which is almost granite, until at last, 1,000 or 1,500 feet beneath the surface, the hand of man reveals a deep and rapid river coursing through those solitary sunless depths, at a speed of ten miles an hour, swifter than the Ohio, Mississippi or Hudson, or any of the bountiful and important streams of this country, flowing, as they do, through picturesque mountain scenery, stately forest, or enameled meadow, amid towered cities, or cultivated fields. And when the shaft has reached that imprisoned river, and the rent for the first time has been made through its dungeon wall, the waters, remembering the august source on far distant mountain-tops, whence ages ago they fell, leap upward to the light with terrible energy rising in an instant far above the surface of the earth, and pouring forth their healthful fertilizing current to delight and refresh mankind. And with even such an awakening are we gladdened when half-forgotten humanity bursts from time to time out of the depths in which it has pursued its joyless, sunless course, moaning and murmuring through long years, but never quite forgetting its divine and distant origin. Such was the upward movement out of the intellectual thralldom which we call the Reformation, when the shaft of Luther struck the captive stream; such an awakening, but a more significant and hopeful one, has been heralded over this whole Republic, East and West, North and South, and for all humanity, by the triumph of the light in the recent four years conflict, in which all have been conquerors.

KNOX COUNTY, ILLINOIS, April 23, 1889.

EDITOR JOURNAL OF THE TELEGRAPH.

A few days since a message reached this office from a village in Missouri, having passed through one or two Repeating Offices on the way. When it started it bore the signature of "Ella;" when it reached this office it had been shorn of its beauty, by the signature having been changed to "E. T. Lack."

I believe it is safest for an operator not to know any thing about what a signature should be—only be sure of what it is; but, as is often the case in small offices, an operator, when receiving, feels sure of what the "sig." will be long before he gets it, from a personal acquaintance with the parties, and a knowledge of the facts stated, so in this case, the writer hereof, after thrice breaking on the "sig," and insisting that the signature must be wrong, was finally compelled to "accept the situation," and "E. T. Lack" for the first time greets the astonished young man to whom "Ella" had addressed the message. It will be very readily seen that the ck of "Mr. Lack's" name should have been prefixed to the check (or omitted) and not affixed to Ella's name.

Yours truly,

"A. B."

TROY, April 29, 1869.

EDITOR JOURNAL OF THE TELEGRAPH.

MY OLD FRIEND—Inclosed please find check for over 14 subscribers to the Telegraphers' Insurance. Allow me to say I think it one of the very best things I know of. We had it brought close home to us in the death of "Winnie," one of our number, and had it not been for his membership he would have been buried by charity. I cannot say with the subscriber who refused to renew, "because he had derived no benefit after having been a member for a whole year." I have been repaid FIFTY times over in the satisfaction I have derived from the thought that the few dollars I have paid have been the means of giving relief to the families of our deceased brothers.

Yours truly,

W. C. BUELL.

## Russian Railways and Telegraphs.

## IMPORTANT LINES BUILDING—RESOURCES OF THE COUNTRY.

[Correspondence of the N. Y. Times].

It may be safely predicted that in a couple of years Russia will be covered with such an iron network as will give means of quick and easy communication with the different parts of the Empire, and render possible the development of immense mineral and agricultural resources, to the present time comparatively dormant. The vast tract from the Carpathian Mountains to the Ural range, and from Moscow to the Black Sea and the Caucasus, is equalled in fertility of soil and abundance of iron and coal only by the best States of the Mississippi Valley. The anthracite of the Don and the south of Russia is equal to the best American.

In view of the value and amount of natural wealth, as well as of the immense distance, it is evident that the railroad question must be the one of the hour, and that the railroad fever is at its height throughout the whole extent of the empire. In traveling from Moscow to Kieff, one is reminded of the Illinois Central, and the country between Chicago and St. Louis—rich rolling prairies and pasture lands on all sides. In such a country there are few deep cuts and no tunneling. In May the trains will run directly from St. Petersburg to Odessa, connecting the Baltic and Black Seas. In about one year there will be direct communication with the Sea of Azoff through the port of Taganrog. A very important line is also the Moscow-Smolensk, which will bring Central Russia in direct communication with the west—through Warsaw by rail, and by water through the northwestern ports in the Russian Baltic Provinces. One of great importance will doubtless be built in a short time between the Caspian and the Aral. This will bring Central Asia into direct and easy communication with Russia and the rest of Europe, of immense importance commercially. At present the transactions between Russia and Central Asia amount annually to thirty millions of rubles, or \$23,310,000, the rouble being equal to 77.7 cents. All this trade is carried on by caravans over the plains and through Ovenburg. The distance between the

Caspian and the Aral is less than three hundred miles. I am told by good authorities that in two or three years after the completion of this road trade would be at least trebled. The Amoo Daria is navigable for a distance of nearly 1,200 miles. Taking its rise in the Himalayas, it waters the best parts of Central Asia and empties into the Aral. The Amoo Daria is navigable as far as Balk; the Syr Daria almost to Khodjent. With a little improvement in the bed, light draught steamers on the American model might go to Khodjent. How the world is moving on! Railroads, steamboats, and telegraphs, where, but a few years since, travelers were put to death for daring to put their feet upon those forbidden territories. In all probability, before five years have passed, it will be possible to travel from the upper waters of Lake Superior, in North America, to the heart of Central Asia, all the way by railroad and steamboat.

A few words concerning telegraphs. Russia is very much better provided with telegraphs than railroads. The extent of projected lines to be built soon amounts to thirty thousand miles. Among these is one which may interest Americans, as it will afford direct communication with China. This line is intended to connect Peking with the Siberian telegraphs at Possiet Bay, on the Japan Sea. The branch to Possiet is not yet quite finished, but the materials are all ready and on the ground.

## A Newly-Discovered Characteristic of Iron.

A new fact in the behavior of iron under the influence of heat and strain has been noticed by an English scientist. A strained iron wire was heated to redness by a current of voltaic electricity, and then, the current being discontinued, was allowed to cool. It was observed that there arrived a moment in the process of cooling at which the wire suddenly elongated, and then gradually shortened, until it became perfectly cold, remaining, however, permanently elongated. No other metal besides iron exhibited this peculiarity, which is attributed to a momentary molecular change; and this change would probably happen in large masses of wrought iron, and would come into operation in various cases where those masses are subjected to the conjoint influence of heat and strain, as in various engineering operations, the destruction of buildings by fire, and other cases. The phenomenon deserves a further investigation, since every fact relating to iron is of importance to us.—*American Artizan*.

## Attraction of Mountains.

The pendulum experiments in India show that, contrary to theory, the nearer the observing stations are to the Himalayas, the less is the force of gravity, the difference between theory and fact diminishing with the distance from the hills. This seems to confirm the opinion of Professor Airey, that the strata of the earth below the mountains are less dense than the strata below plains and the bed of the sea.

Why is a battery man like a newspaper editor?  
Because he does up the "locals." "I"

AN article on the inventions of our friend Mr. George Little has been unavoidably postponed to our next number.

Our readers must excuse us from any expression of opinion respecting the comparative value of the different modes of insulation in use until we can feel secure that each has had its proper test. It is a subject which has caused much anxiety and on which a vast amount of money has been expended. Those who are devoting themselves to the investigation of this interesting problem are deserving of all praise.

**Beautiful Hands.**

Such beautiful, beautiful hands;  
They're neither white nor small,  
And you, I know, would scarcely think  
That they were fair at all.  
I've looked on hands whose form and hue  
A sculptor's dream might be,  
Yet are these aged, wrinkled hands  
Most beautiful to me.

Such beautiful, beautiful hands,  
Though her heart were weary and sad,  
These patient hands kept tolling on  
That children might be glad.  
I almost weep, as looking back  
To childhood's distant day,  
I think how these hands rested not,  
When mine were at their play.

Such beautiful hands, beautiful hands,  
They're growing feeble now;  
For time and pain have left their work  
On hand and heart, and brow,  
Alas! alas! the nearing time,  
And the sad, sad day to me,  
When 'neath the daisies, out of sight,  
These hands will folded be.

But oh! beyond this shadow-land,  
Where all is bright and fair,  
I know full well these dear old hands  
Will palms of victory bear.  
Where crystal streams, through endless years,  
Flow over golden sands,  
And where the old grow young again,  
I'll clasp my mother's hands.

**Compound Telegraph Wire.**

Boston, April 20th, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

Referring to the article on compound wire in your last issue, questioning its ability to withstand the elements equally as well as iron, and inviting the communication of facts in relation to its capacity and value, we are gratified to be able to give information, such as should convince the most skeptical, of the entire truthfulness of each and every claim made for this improvement; and, to this end, we invite a thorough examination of the special cases hereinafter mentioned, also as to the general behavior of the compound wire lines, through the winter.

The first compound wire of any considerable length was strung in the latter part of May, 1868, on the Alton Bay branch of the Boston and Maine railroad, by J. S. Bedlow, Esq., superintendent Western Union Telegraph Company. This line is twenty-nine and a half miles in length, has the No. 16 steel core (smallest size used), is supported on glass and brackets, and strung quite taut. Mr. Bedlow has very kindly furnished a statement, dated April 1st, 1869, referring to this wire, and also to another of about the same length, subsequently strung for the Eastern railroad, in which he says these wires have stood the extreme cold weather and sleet of the past winter *without a break*, the thermometer reaching *twenty-three degrees below zero*, on the morning of March 6th.

In June, 1868, a compound wire line, of some one hundred and fifteen miles or more, was put up by general superintendent M. L. Wood, Esq.

Mr. Wood, having a desire to so string wires as to leave no possible chance for crosses, and having great confidence in the ability of the compound wires to stand a tight strain, acted directly against our advice in this instance, by stringing it *exceedingly taut*, on twenty-three poles to the mile, and in hot weather. The results of cold weather, and sleet of the past winter, proved that Mr. Wood had made no mistake, as English galvanized wire on the same poles, having an ordinary slack, failed to stand, while the compound has, in the words of Mr. Wood, "*stood the test of winter splendidly*."

Subsequent to the erection of this line, and later in

the season, Mr. Wood constructed a line from Toledo to Detroit on fourteen poles to the mile, using a wire with No. 15 steel core. Of this line he says, in a letter referring to the winter tests of both lines, "The line from Toledo to Detroit, of No. 7 compound, with fourteen poles per mile, has proved most satisfactory. No break reported, except from falling trees or other equally severe test."

It is presumed that the statement referred to in the JOURNAL, claiming breakage of the compound wire oftener than iron, has reference to an article of a recent date, from a correspondent at Emigrant Gap, on the Pacific railroad.

This statement referred to a compound wire line in the Sierra Nevada mountains, and probably to the great storm of February last, in that region. In answer thereto, we can only say that our advices were very radically in opposition to those of the Emigrant Gap correspondent.

Mr. S. D. Field, line constructor on the Pacific coast, writes, in relation to this storm that the compound wire was broken only from falling trees, there being five breaks in an iron wire on the same poles to one in the compound. Also that an equal strain was put on the compound in stringing, as on the No. 9 iron, thus drawing the compound much straighter. Mr. Field also states that out of seven iron wires and one of compound, the last named was the only available line across the mountains for two days after the cessation of the storm. This wire has the No. 16 steel core; outside diameter No. 13½.

The above are a few facts which we have stated in response to the invitation contained in the JOURNAL.

It is true, as implied in the JOURNAL article, that the iron wire, even when drawn up well, has considerable slack, and that the steel wire, being lighter, is apt to be drawn much more nearly straight; but is there any reason why a compound wire, because of its lightness, *should be drawn straighter* than it is customary or necessary to draw iron? Yet it has been done, and the results have proved that, notwithstanding the disadvantage under which it is thus placed, it stands better than English; and in one case (not above given), to a high cost Norway iron.

We believe this quality of withstanding a great and constant tension to be due, in a great measure, to uniformity in the tensile strength of the steel; and this has been one of our most important claims for the wire. The fact of the steel being drawn to the necessary size in its manufacture is assurance of its uniformity, otherwise it would break in the drawing. This is not so with iron, and, of course, the weak spots are the first to give way when brought under unusual strain.

It is well known that an iron wire will break oftener the first year than the second, yet most of the compound and iron wire comparisons have been made with *new* compound and comparatively *old* iron wires.

Another quality of the compound wire, and one which gives it another advantage over iron in very cold weather, etc., is its elasticity.

If an iron wire be stretched the sag is permanently increased in a great measure, while it has been ascertained that properly tempered steel is capable of being elongated, by a gradually applied strain, a two hundred and fiftieth part of its length without setting, and will consequently return to its normal position upon removal of the strain. In case of the compound wire, the copper is controlled by the steel.

Hence, it appears that while an iron wire will be constantly increasing in length on account of changes of temperature, etc., a compound wire will practically retain its original condition, with ample margin for contraction and elongation, in virtue of its elastic property.

CHESTER SNOW,

President of the C. T. W. Co.

**The Age of Humbug.**

EDITOR JOURNAL OF THE TELEGRAPH:

QUEBEC, April 22, 1869.

The shareholders of the Dominion Telegraph Company met yesterday at the Board of Trade rooms, for the purpose of receiving the report of Mr. Murphy of his visit to Toronto, whither he was sent to investigate the affairs of the New Dominion Telegraph Company. At the conclusion of Mr. Murphy's explanations, the following resolutions were unanimously adopted: "Moved by Mr. Garneau, seconded by Mr. Roche—

"That, in the opinion of this meeting, the gentlemen who have lent their names as directors to the Dominion Telegraph Company are highly censurable for not attaching more moral importance to the obligation incurred by them as directors.

"Moved by Mr. Roche, seconded by Mr. Henry—

"That the information furnished by Mr. Murphy, who was deputed by the stockholders of the New Dominion Telegraph Company of this city to go to Toronto to inquire into its affairs, prove it to be unsound in its inception and in all its management, and that this meeting, by this resolution, binds itself to resist payment of any calls made, the expense of defence to be borne *pro rata* to their stock.

"Mr. Joseph moved an amendment, inserting the words 'until such time as a satisfactory account is given.'—Carried."

Next motion was: "Resolved, That the public are under obligations to the Montreal *Trade Review* and Mr. Wiman, for the energetic, able, and independent manner in which Reeves' manipulations have been exposed, and subscribers to the stock of the New Dominion Telegraph Company placed on their guard."

After a vote of thanks to Mr. Murphy, the meeting adjourned.

**San Francisco Fire-Alarm.**

THE NEW FIRE-BELL TOWER AND THE BOOMS OF THE TELEGRAPH OPERATORS—SPLENDID APPEARANCE, ETC.

Ever since the terrible earthquake, that for a time rendered tenantless the old City Hall, the fire-alarm telegraph operators have manfully and bravely performed the hazardous duty of remaining in that dilapidated old shell which, at every stroke of the fire-bell, trembled from roof to basement. When all the other offices were removed, they remained watchful sentinels over the welfare of the city; and, as a just reward for their services, they are now furnished with safe and suitable apartments over the first story of the Exempt Fire Company's house on Brenham place. The front room is fifteen by nineteen feet, and is splendidly furnished, and contains the telegraph apparatus. Adjoining this is a private office, and further back are two sleeping rooms, elegantly fitted up for the operators. The battery-room extends from the main office thirty-five feet along the south side of the building. In this are one hundred and fifty cups of the new Mediguer battery. Thirty-three wires centre in the office, twenty of which are signal wires. Six lines run for the police, and the remainder to other public places and institutions. Last night the operators took formal possession of their new apartments, amid the congratulations of a number of invited guests, who were welcomed with sparkling wine and cordial greetings from the Superintendent, Monroe Greenwood, and the operators, Messrs. S. D. Field, D. W. Swain, and C. F. Simmons. Toasts were offered, and the old bell tolled in honor of the occasion. From the operators' room a splendid view of the city can be had, while from the balcony around the top of the tower one can overlook nearly the entire city.

## Telegraphic Honors.

NEW YORK, April 27, 1869.

MY DEAR SIR—Ever since I received the proof of your great skill, in connection with your skilful associates, in testing rapid transmission of despatches by the Morse telegraphic system, I have been desirous of manifesting to you, and also to N. J. Snyder, Esq., of Philadelphia, some token of my gratification on your accomplishment of feats which, so far as I know, are unexampled in the annals of telegraphy.

Please, therefore, accept from me, on this the 78th anniversary of my birthday, the accompanying gold pencil-case and pen, as a very slight, and, indeed, inadequate expression of my admiration of your masterly performance of recording 2,731 words in one hour, a feat which I have not failed to put on record in my report to the Department of State on the telegraphic apparatus of the Paris Exposition of 1867.

The necessity for exclusive attention in preparing the above-mentioned report has prevented an earlier recognition of your skill. My thanks are also due to all concerned in the satisfactory result of the test of speedy transmission.

While your associates deserve high praise for their rare dexterity in manipulation, you and Mr. Snyder, I think, deserve the highest praise for the admirable, and, indeed, faultless manner of recording that which was so ably transmitted.

Accept also the assurance of my sincere respect and esteem.

SAMUEL F. B. MORSE.

WALTER P. PHILLIPS, Esq.,  
Providence, R. I.

NEW YORK, April 27, 1869.

MY DEAR SIR—The necessity of exclusive attention to the preparation of my report on the Telegraphic Apparatus of the Paris Exposition of 1867, which, as United States Commissioner, I have just sent in to the Department of State, has prevented me from earlier acknowledging my indebtedness to you, and also to Walter P. Phillips, Esq., of Providence, R. I., for the result of the test of speed of transmission by the Morse system, which was accomplished early in 1868.

Your great skill in recording 2,520 words in one hour, and Mr. Phillips' feat of recording 2,731 in the same time, are feats which, so far as I know, are unexampled in the annals of telegraphy.

Please accept from me the accompanying medal (a souvenir of the great Exposition of 1867), as a small token of my admiration of your masterly performance. In the report above-mentioned I have noted these results as worthy of special record. Accept the assurance of the sincere respect and esteem of

Your obedient servant,

SAMUEL F. B. MORSE.

N. J. SNYDER, Esq., Philadelphia.

## Two Superintendents made Happy.

We are pleased to read the record of the presentation of a beautiful gold American lever watch to Col. W. H. Heiss, the able and experienced General Superintendent of the International Ocean Telegraph Company, and of a solid silver ice-pitcher to his worthy assistant, Major W. W. Sadler. These gifts were presented very gracefully by T. W. Scull, Esq., Manager of the Baldwin, Fla., office, and responded to by the grateful recipients feelingly and appropriately. There is no more faithful man in the profession than our old friend Heiss, and now if he is not up to time, all the time, with the aid of this new gift or without it, we have mistaken the man. Mr. Sadler is a most capable assistant.

RICHARD W. WINANT, lately employed as clerk at the Western Union Company's Stock Exchange office, was dismissed on the first instant for dishonest practices.

## Pope's Modern Practice of the Electric Telegraph.

The value of this work will be found to be its simplicity and absence of scientific pretension, although scientifically exact and complete. We are able to give the following extract and illustrations, furnished us by the author, to show the practical character of the work and its adaptation to a widely felt necessity.

Fig. 17.

ARRANGEMENT OF A TERMINAL STATION.—Fig. 17 is a diagram showing the arrangement of wires, batteries, and instruments for one of the terminal stations of a line. The line wire L first enters the lightning arrester X, and passes thence through the coils of the relay M by the binding screws, 1, 2, and thence to the key K, main battery E, and finally to the ground at G. The local circuit commences at the + pole of the local battery E, and through the platina points of the relay by the binding screws, 3, 4, thence through the register or sounder coils, S, and back to the other pole of the battery.

ARRANGEMENT OF A WAY STATION.—Fig. 18 shows a plan of the instruments and connections at a way

Fig. 18.

station. The line enters at L, passes through the lightning arrester X, and thence through the relay M, key K and back to the lightning arrester, and thence to the next station by the line L. The arrangement of the local circuit is the same as in the last figure. The button C, arranged as shown in the figure, is

called a "cut-out." When turned so as to connect the two wires leading into the office, it allows the line current to pass across from one to the other without going through the instruments. The instruments should always be cut out by means of this apparatus when leaving the office temporarily, or for the night, and also during a thunder storm, to avoid damage to the apparatus.

The Ground Switch, Q, is used to connect the line with the earth on either side of the instruments at pleasure. It is only used in case of accidents or interruptions on the lines, as will be hereafter explained.

FAULTS OF THE MORSE APPARATUS.—The principal difficulties which the operator is liable to meet with in working the Morse apparatus are as follows:

1. When the paper in the register does not run freely from the reel on which it is held, or sticks in the guides, from irregularity in width, or if the style is adjusted to indent the paper too deeply, the paper moves irregularly, shortening dashes into dots, and causing dots to run together.

2. The style should be adjusted so as to move freely in the groove of the upper roller, or the marks will be more or less indistinct. If it is completely out of the groove, no marks will be produced. These faults generally arise from too much end play in the pivots of the lever, or from the pivot screws working loose. When the lever works too loosely in its bearings, irregular dashes, too deep at their commencement, and tapering off to nothing, will be produced.

Residual magnetism sometimes causes the armature of the electro-magnet to stick. This will always happen if the armature is allowed to touch the poles of the magnet. The screw stop should therefore be adjusted so as to prevent the armature from approaching too closely to the poles of the magnet. The upper screw stop, which regulates the play of the lever, should be adjusted so that the movement is just sufficient to withdraw the style from contact with the paper.

3. If the paper runs between the rollers "crooked," the pressure of the upper roller upon the paper is greater at one end than the other. This pressure is regulated by two springs, one on each side of the instrument, and they should be made as nearly equal in pressure as possible.

## Durant's Nonpareil Relay.

The following comes from the night manager of the Western Union Telegraph Office at Providence, R. I., and which we are glad to publish:

PROVIDENCE, April 24, 1869.

DEAR SIR: I have given the Nonpareil Relay which you sent here, a very thorough trial on different wires and under all manner of circumstances, always with the happiest results. It has, however, been used chiefly on a long circuit, extending from New York to New Bedford, via Boston, which is devoted to press business. The "current" on the wire in question changes often from various causes, when the weather is not wholly clear, and I have always found the Relay received from you to accommodate itself to the variation with wonderful facility. It was in use on the night of the 15th inst., on which it will be remembered that the auroral display occurred, and the operator who was on duty here on that occasion avers that he was able to receive from New York, with comparative ease, while stations varying from fifty to one hundred and fifty miles nearer New York, where the ordinary Relay is in use, found it impossible to adjust their instruments to the ever changing "current," and were, consequently, put to the necessity of frequent "breaking."

If your Relay has faults, they are sufficiently diminutive to have escaped any careful scrutiny, and I have no hesitation in pronouncing it, in my opinion, a marked improvement on all that has gone before.

Truly yours,

WALTER P. PHILLIPS.

To Mr. Charles Durant,  
New York.

# Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

## TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MAY 1, 1869.

## United.

With the opening of the flowery eyelids of the blooming month of May, the last rails are being laid which are to connect the Atlantic and Pacific in a Union which, we trust, may be eternal. One rail only remains unlaid awaiting its formal consecration on the 10th instant. It is the great event of the century. No man can forecast its splendid results. It will open up a wealth of population which must follow the tread of the locomotive, which will change the centres of civilization, and make old ocean a crowded highway of emigration to these vast domains. America will be, henceforth, the pathway to China for all Europe. San Francisco will rival New York in coming years as the great entrepot of Asia, and both will be mammoth in extent, in population, and in influence.

The Union we hail as the marriage of the oceans and the nation. No day could better herald the event than that which ushers in the season of bloom and beauty. The world may well be gay to-day. It is the day of the grandest physical triumph the earth has seen. May God bless it.

"Like spectral lamps, that burn before a tomb  
The ancient lights expire;  
I wave a torch, that floods the lessening gloom  
With everlasting fire!

Crowned with my constellated stars I stand  
Beside the foaming sea,  
And from the Future, with a victor's hand,  
Claim empire for the Free!"

## Magnets.

It is a remarkable fact respecting the Morse system of telegraphing that, since its first introduction, no change has been proposed or effected therein, which has, in the least degree, improved it so as to render it more effective, or better to answer the ends for which it was designed. This cannot be regarded as other than high praise. The elements are so simple, so utterly without complication, that nothing more seems possible to render it more complete.

In a very weak article in "Engineering," we see that in claiming for Wheatstone the first place as a telegraph inventor, it is charged to Prof. Morse, as evidence of ignorance, that he used at one time magnets which were so large that one of them required three men to carry it. This is said to show how crude were his ideas, and how clumsy his thoughts of the machinery needed to carry out his plans. His supposed ignorance of the small and beautiful magnets, covered with fine and delicate wires, which appeared about the same time in France, is evidence to these jealous Englishmen that Mr. Morse was a mere artist who blundered into a discovery which, though it has given him a world-wide reputation, yet gives him no title to the fore rank so many claim for him.

Now it is a little curious to know that, in the matter of magnets, we are just about to return to the very position of Mr. Morse when he made his ponderous magnets, of whose weight we ourselves have had some experience,

and which we used to look upon with a kind of wondering awe. Solemn things indeed were they, enclosed in black walnut cases, under lock and key from human eyes, except when Mr. Vail used to open the door an instant, and revealed to our wondering eyes the mysterious spark which allied that ominous box with the lightning of the skies.

These magnets were made on the supposed necessity of presenting no unnecessary obstruction to the current of the line, and that, for this purpose, the nearer the wire of the magnet approached the capacity of the outside conductor the better. No sane man can deny to-day the correctness of the idea, and the desirableness of such an attainment. Our magnets have been one of the great evils connected with the whole system. Under a desire to secure great sensitiveness, the size of the wire wound around magnets has not only been ruinously reduced, but the coils have been enlarged and elongated, until the resistance of a single magnet has sometimes exceeded the resistance of a hundred miles of line, and thus rendered the manipulation of the crowded and obstructed circuits an operation of the most irritating difficulty. How often have we felt relieved when 8 P. M. would come, and cut out the magnets of the intervening offices, so that the lines would work easily and the crowded files might be cleared. Even to-day, good insulation is rendered imperfect, the action of many important circuits made unsteady, and repeaters indispensable, just because of the obstruction of multiplied coils of fine wire which, under beautiful forms of velvet or rubber, check and embarrass the flow of the electric current.

"But are we to have these mammoth magnets again?" Oh, no. "What then?" Only this, that our magnets must have their wires of such size as shall admit of easy and complete saturation with the least obstruction, and the quantity used be reduced to as low a standard as efficiency will permit.

"How large then would you have the wire of a receiving magnet?"

We think the wire should never be smaller than No. 30, and, if the copper is pure, this size of wire may be found sufficiently large, although No. 28 may yet be preferred.

"How large, then, would you make your coils?"

We would have the coils so small that the resistance of a magnet would not exceed that of, at most, five miles of the main line, and, if possible, not more than three or four. Even this seems an immense resistance, rendering the magnets of some way wires equal to that of the whole length of the main wire itself.

"Has this size of magnet been tested?"

When we had charge of the lines south of Louisville nearly 20 years ago, when Witman reigned at Louisville, and Zook at New Orleans, we used a receiving magnet at Louisville, Ky., an inch and a half in length, and not exceeding an inch in diameter, which we have never seen excelled. A number of such magnets have recently been put into long and important circuits, which have removed one-half of the insulating resistance, and increased the capacity of the wires in bad weather immensely. The proof is important, clear, and abundant. We are convinced that more than half of the evils attending our insulation, and a large amount of bad temper and blundering would be removed by such a reduction of the resistance now offered by most of our magnets. Let manufacturers take the hint in time. In a year hence, on all important circuits, large magnets of fine wire will be unknown, or, if used, will be either because of the impecuniosity of the companies, or because the truth, so apparently self-evident, has failed to arrest the attention which it merits.

## The Auroral Currents.

We have given else where a brief account of the recent brilliant display of the Aurora Borealis, and its effect upon the wires. We are asked if the currents produced on the wires during these displays are atmospheric, acting direct from these auroral phenomena thus irradiating the heavens, and which weave their triumphal coronas up apparently among the planets?

Although there are, unquestionably, large masses of electric clouds sailing in the upper regions of the air during the presence of these auroral displays, yet the fact that all, or nearly all, interference from the currents then exhibited can be prevented by simply using two

wires instead of the earth and wire, proves that these currents are caused by a disturbance of the earth's normal electric state. The earth's ordinary electric tension is disturbed, and its currents are, so to speak, scattered by this induced current from the vast masses of electricity in the sky, but are ever seeking, by the violent action peculiar to them, to restore themselves to their normal condition, thus causing temporary electric currents of great power and rapid changes of tension. Thus they enter a wire from one earth connection in this effort at restoration, and are chased back by another from the opposite extreme, exhibiting the violent and changeful currents which mark these magnetic storms. The earth, itself, is a great reservoir of electricity, offering no sensible resistance to the entrance of electrical currents, yet varying in its electric tension or condition at different points. This causes an almost ceaseless action of the earth's currents, and at almost all times they can be felt upon the wires which they use to effect the equalization of their tension. During the auroral displays this action is excessive. At the same time it can scarcely be regarded as incorrect to say that it is the induction of vast volumes of electricity from the upper air which cause these extraordinary currents which, as we have seen, can be utilized and harnessed for human service; and as a line can be worked by any polarity, provided the whole wire is worked with a like polarity, the changing currents do not prevent the line from being operated during the violent contest for the supremacy of the one current or the other.

## Kissing by Telegraph.

A bright-eyed cheerful looking lady went recently into one of our offices, where the machinery being visible, she saw the process of transmission as her own message to her husband was manipulated by the operator. A few moments sufficed to complete the work, and she was informed that the message was sent.

"Gone! already!" she exclaimed, "and when will my husband receive it?" inquired the delighted face.

"In a very few minutes," replied the operator.

"Oh! how I do wish I could send him a kiss as quick as that," uttered this little loving wife as the telegraph seemed to bring the lord of her heart near to her.

"Oh," responded the dapper operator, "that is easily done, give me the kiss and one dollar, and it will be sent!"

It took several seconds for the blooming wife to comprehend the situation. The offer was bold and pert. Its full meaning did not at once dawn on her. The science of kiss transmission was not clear to her. Besides, the operator was homely. The medium was unpromising. But the womanly sense came, and with it, indignation.

"Kiss you! a dollar!" she said, with a rising lip and curling nose, "Kiss you! the company should employ a better looking man than you, sauce box!" and with a snort which seemed to come from her soul, the little angry lady flouted out into the open air, the sweet visions of labial bliss thus rudely broken by the proposed medium of the impertinent lips which offered to make it possible.

We have received a number of orders for the new work of Mr. Pope on Modern Telegraphs, and will take pleasure in supplying all who desire, on receipt of the price. Mr. Pope designs leaving a number of copies in our hand for that purpose. Price \$1.50, which includes the postage.

Among the computations made by some of our telegraphic savans while watching the auroral current is the following: "The test of the strength of the current on the wire from auroral influences shows that at such seasons there are 30 millions of horse power for every cubic mile of space! This is obtained by ascertaining first the strength of the current, and then the cubic space occupied by the wire. Now, gentlemen, we demur. We can't see it. Because the wire exhibits a certain strength of current it by no means proves that the air adjoining is charged to a like degree. If the influence was simply atmospheric it would be clearer, but this not being so, and earth contact essential to the exhibition of any current at all, we must reject the computation as entirely too many horses between us and heaven.

We have on hand a few bound copies of the first volume of the JOURNAL OF THE TELEGRAPH, which we will send, post-paid, on receipt of two dollars and a half.

Prof. S. F. B. Morse entered his 79th year on the 27th ult. He was born at Charlestown, Mass., April 27, 1791. His step is as youthful, and his back as straight, and his spirits as buoyant, as thousands who bear not half his years. He has all that Cowper enumerates as desirable in advanced years, "an elegant sufficiency, retirement, books," and a zest for active life, and a cheerfulness, which always makes his presence welcome and instructive.

By a communication from Toronto, Canada, we learn that a delegate sent from Quebec from the stockholders of what is called the Snow Reeve New Dominion Telegraph Company, to investigate the condition of its affairs, reports the concern as utterly unworthy of public confidence. The papers of London, Ontario, announce that the stockholders there have concluded to initiate proceedings in Chancery for the purpose of recovering the money they have invested in this snowy enterprise, satisfied that the whole scheme is an unmitigated imposture.

We take no special pleasure in ventilating these bogus enterprises, because we had hoped that the "age of humbug" was passed, and that proof enough had been given that a telegraph line, to be a success, must first be needed, and, secondly, be built under the distinct control and inspection of those who invest their means in the erection of telegraphic structures. In Canada, the Montreal Telegraph Company has adopted a low standard of charges; has opened up its lines to the freest and most liberal public use; has manned its offices with intelligent and fairly remunerated men; has erected wires enough to secure speedy despatch of business, and has, we believe, done everything which the public can desire, consistent with self support, to meet public necessities. We do not believe that there is in Canada a demand for such enlarged facilities as to justify expectations of successful competition, which, we believe, would only tend to destroy the value of telegraph property, reduce the compensation of its agents, and cripple its healthy administration.

In *Le Nord*, is published an interesting account of the progress of telegraphic correspondence in Russia.

The revenue derived from this source during 1868 amounts to 11,175,104 francs, being 1,217,804 francs more than during the previous year. This increase is stated to have followed the adoption of a reduced tariff, and has proved to the authorities that high charges, both for the postal and telegraph service, is injurious to the revenues of these administrations, and harmful to the general welfare.

## Married.

April 18th, at the residence of the bride's mother, by the Rev. G. Abbott, Mr. J. S. Hunter, Manager Western Union Telegraph office, Marion Ala., formerly of Philadelphia, to Miss Amisona Bates, of Perry County.

Philadelphia papers please copy.

## Wire.

We need not call attention to the letter of Mr. Chester Snow, which may be found elsewhere, for it will be read by all who desire information on the possibility of improving and strengthening our conductors. On one point it corrects an impression we entertained, that steel lacked that ductability which, when drawn taut in summer, would prevent its injury when exposed to great cold. In this we are glad to be corrected. Steel wire is not only ductile, but its ductility is that of elasticity, which restores the wire to its former condition as soon as the strain is removed. In this it differs both from the iron and copper, both of which are ductile, but have not the elastic property of the steel just stated.

The question naturally suggests itself, and which we ourselves have asked, "How does this elastic quality of the steel affect the copper covering, which has none, and which must, therefore, apparently, be shrivelled by the return of the steel to its former condition?" The answer is, that "it don't," which is, perhaps, the most satisfactory which can be given. If "it don't," it is little matter why "it don't." One thing is clear. If the steel is drawn taut in summer, its length is not diminished in winter, the wire simply changing its molecular condition, but not occupying any less or any more space than before, so that the copper is governed by the superior resistant and elastic powers of the steel. We cannot help feeling that there is a valuable element in this wire which will yet render it a substantial success. The specimens of it shown to us by Messrs. Tillotson & Co., who are agents for its sale, are certainly beautiful, and indicative of a careful preparation, which speaks well for the skill and the earnestness of its manufacturers. Not the least valuable property of such a wire is the ability to keep it always taut, straight and rigid, so that crosses, except when caused by falling bodies, or design, will be impossible.

Scarcely less pleased were we to see, at the same house, evidence of increased care in the production of galvanized wire, samples exhibiting unusual tenacity, and having a galvanized surface which the most ruthless twisting did not seem to disturb, justifies the large demand made for it. The scale of prices, also, is lower than the ordinary market quotations.

The British-Indian Telegraph Company have entered into contract with the Telegraph Construction and Maintenance Company for the laying of 3,600 nautical miles of submarine cable between the Isthmus of Suez and Bombay. The capital of this company is £1,200,000, and its design is to reach India and eventually the Chinese coast by cable almost exclusively. The contract for laying the cable to Bombay is £1,000,000; £540,000 cash, and £460,000 in paid up shares; £440,000 will be paid when the cable is successfully laid to Aden, and £100,000 reserved until the line is completed to Bombay. Only £170,000 in shares has been put on the market, all of which have been taken, and a distribution of profit shares to the amount of £137,000 will be made on the completion of the work. Twelve words per minute has been guaranteed as the minimum capacity of the cable, and the whole work is to be completed by April 1, 1870. Curiously enough it has been determined to make the core of this important cable quite small, much less than the Atlantic cable. The company will own the steamer engaged in laying the cable, and keep it in readiness for repairing damages.

THERE is no other spoken language so cheap and expressive by telegraph as the English. So the electric wires are becoming teachers of our mother tongue in foreign countries. The same amount of information can be transmitted in fewer English words than French, German, Italian, or any other European language. In Germany and Holland especially, it is coming to be a common thing to see telegrams in English, to save expense and ensure precision. Thus, the red, white and blue, the Celtic, Teutonic, and Latin elements of our English language, will yet make the tour of the globe, and be the silent speech, fitted to the flashing lips of lightning as well as the tongue which half of the earth's millions will speak within two centuries of the present time.

## You Lie Like the Telegraph.

The telegraph in Prussia must be in bad hands. Count Bismark says that it will not be long before the expression, "You lie like the telegraph," will be recognized everywhere as an accepted proverb. If the irascible old premier had said, "You lie like Reuter," there would have been some sense in it. The emanations from Reuter are curious enough. Now it is, and now it isn't, follow in quick succession, and the truth is seldom fully known until the steamers come and give the details. Of late Reuter has improved. He finds a reputation for uncertainty too damaging. He has curbed the imagination of his deputies. Yet there is enough left to justify even so rough an epithet as the one we have suggested.

The telegraph proper tells no lies. It has nothing to tell. It is a tongue for others. When it lies, it is some one using its fiery lips to pronounce it. But Count Bismark is not the only one who thus errs. Thousands of fools charge the telegraph companies with the follies which sometimes find passage over their wires.

**WANTED.**—A copy of the pamphlet containing the proceedings of the 1st. annual, 2d annual, 4th annual and 8th annual meetings of the American Telegraph Confederation. Any of our readers having a spare copy will confer a great favor by forwarding the same to  
GALVANI,  
Care Editor JOURNAL OF THE TELEGRAPH.

## IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

## THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

## THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

## GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

## THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

**Nature's Non-conductors.**

To keep a thing cool in summer and warm in winter requires, curiously enough, although the results are so different, the same appliances. To preserve ice throughout the hottest weather we have to surround it, as we do ourselves in winter, with non-conductors. Thus the sides of our ice-houses are filled in with sawdust or charcoal, and we wrap our crystal Rockland or Wenham Lake, on the hottest day in August, in flannel to keep it cool, as we in December envelope ourselves with the same material that we may retain our natural warmth. In the former case the non-conducting wool prevents the external heat from reaching what it covers, and in the latter it hinders the internal from escaping.

Nature, in its provident care, has freely distributed among its numerous dependents these non-conductors wherever they might prove the most useful. The eider-duck, a bird peculiar to cold climates, is furnished with a down which is almost impervious to heat. So with the swan and most birds, and especially their young, the plumage of which is exceptionally soft and light, as these fledgelings require more and produce less heat than those of stronger wing. This beneficent care of nature has extended still further, and penetrated even to the egg, where the living principle has been warmly enveloped with a non-conducting albumen (white of the egg), and its vitality thus preserved, in spite of its frequent deprivation by absence of the hen-bird of the maternal warmth. The eel, tench, and also the garden-slug, or snail, have the power of secreting a slimy fluid, which serves as a warm coat to protect them against exposure to unusual cold. Those fish thus provided will live longer when drawn from their warmer element into the colder air than the mackerel, for example, which, having no such provision, is quick to die when landed. The blubber of the grampus and whale, as well as the corpulence of the alderman, are securities against freezing to death, although the former wallow in seas cooled by ice, and the latter waddle at the slowest pace exposed to the frost of a severe New York winter's day. Nature, by a wonderful process of compensation, is always equalizing its distribution of gifts, and thus cold and heat, practically as well as theoretically, become almost convertible terms, and life is made as enjoyable, exposed to the freezing touch of the one as to the melting breath of the other.—*Harper's Monthly*.

**Singular Freaks of Lightning.**

THE TELEGRAPH OFFICE AT COLUMBIA THROWN INTO CONFUSION—A LADY AND CHILD KNOCKED DOWN BY THE CONCUSSION.

Our correspondent at Columbia (Cal.) sends us the following:

On Friday evening, March 13, we had the most severe thunder-storm ever experienced in this vicinity by that oft-quoted individual, "the oldest inhabitant." About half-past eight o'clock "Franklin's steed" commenced bucking in regular California mustang style, and gave us an unusual and alarming exhibition of its power. The lightning took possession of the telegraph line at Gold Springs (about one mile from Columbia), making kindling-wood of five telegraph poles, and scattering the splinters around very carelessly. Immediately after, the operator at Columbia was made aware of the fact that an extra battery had been attached to the line, and an expensive message had been dead-headed through, in violation of the rules of the Western Union. The lightning followed the line into the office, making a report as loud as that of a musket, and filling the room with a shower of fiery stars. The telegraph instruments were both ruined, all the connecting wires under the operating-table were melted

off, and the covering of the insulated wires, as well as the operating-table, were set on fire. The platina points of the relay were melted, and the glass covering over the instrument was filled with minute particles of platina, some of them protruding through the glass on the upper side, although the glass was not broken. After leaving the operating-table, the lightning passed along the wire leading to the local battery, in an adjoining room, and made several holes through the bottom of one of the copper cups of the local battery, and from thence jumped to a lead sink-spout, where it divided its forces, most of it passing down the spout to the ground. A small detachment of it, however, started on a prospecting trip "up the spout," made two very nice round holes, each about the size of a quarter of a dollar, in the pipe, and then attempted to go through a heavy cast-iron sink in two different places, both of which attempts being only partial successes, it desisted from further efforts, and retired exhausted. Fortunately, no one was injured. A lady and child, residing at Gold Springs, near where the lightning struck the line, were knocked down by the concussion, but escaped with only a severe fright.

**Carbolic Acid for Embalming.**

There is an interesting use to which carbolic acid is put, and in which it seems to supply a much needed want, viz., as a means of embalming. It has been used for this purpose in the Bellevue Hospital College, New York, and, it would seem, with great success. The corpse is simply washed with a solution of carbolic acid of a certain strength. If too strong, it becomes so caustic as to destroy the tissue, and render its minute structure one common mass of coagulation. About a moderate strength is one part of acid to 100 of water, and when the muscular tissue is dipped into this it takes its red and natural appearance. In this process the body is not mutilated in any way, no injection is made into the veins, no cut or incision is made upon the body. Bodies thus prepared, of one, two, three, and four months' preservation were examined. The skin was soft and pliant, with the epithelium intact, the body rotund and plump, expression good and natural, the joints free and easy, and, upon dissecting the brain, it was found sound and free from odor, save a faint smell of coal-tar. Even the fluids were preserved, and the lungs, liver, intestines, and spleen, the blood and blood disks, muscular, fatty, and cellular tissue. Even in a subject who died of tubercular disease of the lungs, seventy-three days after death the abscesses of the lungs had not undergone any change, and a laudable pus was found from broken-down tubercles. A curious incident is given in the case of the corpse of a little girl. When the solution was applied to the cheeks and lips, they instantly became so florid and life-like that the parents and friends could not but believe that life still existed. This was simply due to some peculiar chemical change. The simple process of bathing and wrapping the body in cloths saturated with this solution, and injecting the natural cavities or openings with it, is certainly an easy mode of embalming, and a process, too, of vital importance to all mankind. All of the antiseptics, such as corrosive sublimate, arsenical acids, carbolic acids, etc., act, as such, by destroying all sources of decay and decomposition; that is to say, they destroy or prevent the formation of the germs of putrefaction and fermentation, without acting on the mineral or vegetable matters present. Carbolic acid, merely destroys the cause of putrefaction; it meets with and destroys the germs or spores which float in the atmosphere and vitiate it, and this is why the acid was used with such marked success, and so largely in England, Belgium, and Holland during the prevalence of cholera and the cattle plague.—*Medical Investigator*.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
MAY 1, 1890.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since April 15, the date of the last tariff order. Please note them in your tariff book:

**NEW OFFICES.**

Claverack, N. Y., tariff 20c. more than to Hudson, N. Y.  
Kmans, Pa., tariff same as Millerstown, Pa. Business to Emans will be checked to Millerstown.  
Jamesville, N. Y., tariff same as Cortland, N. Y.  
Mt. Joy, Pa., formerly an other line office, tariff same as Marietta, Pa.  
Mt. Dallas, Pa., tariff same as Bedford, Pa.  
Petroleum, W. Va., reopened, tariff same as heretofore.  
St. Marks, Fla., tariff from points North of Louisville to Washington same as Tallahassee, Fla.

Hamilton, Nev., }  
Treasure City, Nev., } Tariff same as Ruby, Nev., unless otherwise ordered.

Pittsfield, Me., tariff same as Newport, Me.  
Charleston, Ind., tariff same as Jeffersonville, Ind.  
Leslie, Mich., tariff same as Jackson, Mich.  
Ironton, Mo., re-opened, }  
Avoca, Iowa, } Offices having Map Tariff will collect according to map scale. All others will make rate to Ironton and La Plata same as heretofore, and Avoca same as Atlantic.

So. Pass, Wy. T., re-opened, tariff same as heretofore.

**OFFICES OPENED ON OTHER LINES.**

Shamokin, Pa., }  
Trevorton, Pa., } Tariff 35 and 3 from Philadelphia. Check Philadelphia.  
Welland, Ont., tariff 35 and 2, currency, from Buffalo. Check Buffalo.

**OFFICES CLOSED.**

Plattsmouth, Neb., White Cloud, Kas., Memramcook, N. B.  
River John, N. S., and Mapleton, Pa.

**TO OFFICES HAVING "SPECIAL SHEET A"**

Tariff to Fairport, N. Y., unless otherwise ordered, same as "special rate" to Palmyra, N. Y.

**GENERAL INFORMATION.**

The post office address of Lehigh Summit, Pa., office is Sand Out, Pa., and post office address of Okaw, Ill., is Arcola.

All offices having Illinois and Mississippi Map will use "Map Tariff" to Bloomfield, Ill., the opening of which office was noticed in last JOURNAL.

In notice to offices having "Special Sheet A" in last JOURNAL, Grennell, O., should read Greenville, O.

Business for Frankfort, Me., should be sent and checked to Winterport, Me. Tariff to Frankfort same as Winterport.

Business for Salmon Falls, N. H., should be checked to and at same rate as So. Berwick, Me.

ON AND AFTER MAY 1st, NEW YORK AND OFFICES BETWEEN New York and Montreal, which have heretofore checked Montreal and St. Johns on business with Montreal Company, will check "Montreal Junction" on such business. Tariff for "this line" will be the regular currency tariff to Montreal less 20 and 1. Tariff for "other lines" will be 20 and 1 to Montreal, plus tariff from Montreal to destination as per JOURNAL of January 1st.

WILLIAM ORTON, President

### The American Artisan Patent Agency and the Atlantic Telegraph.

On Wednesday, March 31, an individual left New York by the Cunard steamer, for the purpose of taking advantage of that unjust provision of the British law which allows the patent for an invention made abroad to the first person who is in possession of the knowledge of the invention within the realm of Great Britain, and thereby securing a patent in that country for a valuable invention made by one of the clients of the "American Artisan Patent Agency." This was discovered by our client on Thursday, April 8, and on that day we telegraphed by Atlantic Cable to our London agent proper instructions, and a suitable description of the invention, to enable him to obtain provisional protection for the invention, on Friday, April 9, and thus secure the British patent for our client from that date. The steamer arrived at Liverpool on the following Monday, and the individual we have mentioned probably reached London on Tuesday morning, the 12th inst., and he must have been greatly disappointed to find that we had anticipated him by four days.—*Am. Artisan.*

### THE STANDARD AMERICAN WORK ON THE TELEGRAPH.

RUSSELL BROS., 28, 30 and 32 Centre Street,

Have just published

### MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A Handbook for Electricians and Operators.

By FRANK L. POPE,

1 vol. large 8vo, with sixty Illustrations.

This book supplies what has long been recognized as the great desideratum in American telegraphic literature. It is a

### THOROUGHLY PRACTICAL TREATISE

And should be in the hands of every Electrician, Superintendent Operator, Line Builder, Repairer, and Batteryman. It contains full descriptions and explanations of all the

### MODERN IMPROVEMENTS IN TELEGRAPHING,

Which have stood the test of actual experience. The construction and management of the different Repeaters, Switches, etc., in use in this country, is explained at length. Full explanations are given of the most approved methods of testing lines and locating faults and interruptions upon telegraph lines, accompanied by numerous diagrams. The work also contains the new system of

### TESTING BY MEASUREMENT,

Which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines. The mode of working the

### ATLANTIC CABLE.

And the apparatus employed will be found fully described in this book. The appendix contains a large amount of useful and practical information, formulae, tables, etc., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever requisite, with

### ELEGANT ENGRAVINGS,

Most of which have been engraved expressly for its pages by the best artists.

### ALL TELEGRAPHERS

Who wish to inform themselves in regard to the construction and management of the various appliances used in telegraphing such as

Batteries  
Keys,  
Relays  
Sounders,  
Registers,  
Switches,  
Lightning Arresters,  
Repeaters,  
Double Transmitters,  
Combination Locals,  
Insulators,  
Cables,  
Galvanometers,  
&c., &c., &c.,

Will find this just the work that is wanted.

Notwithstanding the great expense incurred in the publication of this work, in order to insure its general introduction, and to place it within the means of every telegrapher, relying upon large sales for remuneration, it will be issued at the low price of

ONE DOLLAR AND A HALF.

On receipt of the price of the book, it will, if desired, be forwarded by mail, post paid, to any part of the United States or British Provinces. Orders should in all cases be accompanied by the money to insure prompt attention, and if sent by Post office order or registered letters, will be at the risk of the publishers. Orders may be sent to the editors of THE JOURNAL OF THE TELEGRAPH or of THE TELEGRAPHER; or to

F. L. POPE, Box 6, 138, N. Y. City.

Other agents will be hereafter announced.

### THE HISTORY, THEORY AND PRACTICE OF THE

### ELECTRIC TELEGRAPH:

By GEORGE B. PRESCOTT,

Containing upwards of One Hundred Illustrations of

ELECTRICAL MACHINES,

TELEGRAPHIC APPARATUS, ETC.

IN ONE VOLUME. 500 PAGES. PRICE \$2 50.

Your attention is respectfully invited to the revised and enlarged edition of the above work, written by one who has been engaged for over twenty years as a practical operator and superintendent of telegraph lines, and who is familiar with both the science and art of telegraphing. It is an accurate and exhaustive work on the subject it treats, interesting and valuable at once to the general reader, the man of science, and the practical telegrapher. It presents a concise and reliable history of the invention and progress of the

### ELECTRIC TELEGRAPH,

commencing with the first rude apparatus of Lesage, in 1774, and describing every subsequent improvement made in the art up to the present time. The subject is treated in a scientific, and, at the same time, in a popular manner, the style being divested, as far as possible, of scientific technicalities.

The author is confident that those who wish for a full, yet concise treatise of the

### ELECTRIC TELEGRAPH

will find in this work precisely what they seek.

Copies sent postpaid to any address, on receipt of the advertised price.

Address

GEO. B. PRESCOTT,

Sup't Sixth District W. U. Telegraph Co.,

Albany, N. Y.

### The Brooks Insulator.

REPORT OF MOSES G. FARMER, C. E., BOSTON.

DAVID BROOKS,

DEAR SIR—I do not know how I can better set forth the value of your insulator than by showing what it will do on a No. 9 iron wire with 30 posts per mile, in comparison with what other insulators in common use will accomplish.

The average of No. 9 iron wire in this country will weigh about 320 lbs per mile, and offers about 18 ohms, or British Association units, of resistance per mile.

The resistance which an insulator will offer to the escape of current from a line depends upon the material of which it is made, and also upon the character and condition of its surface. If, during bad weather, an insulator retain much moisture upon its surface, although moisture is a poor conductor in comparison with iron or copper, yet it is an exceedingly good conductor in comparison with glass, porcelain, paraffine, &c., being perhaps a billion times poorer than copper, yet a billion of billion times better than glass.

A common glass and bracket insulator, in average condition upon a line, will, in clear cold frosty weather, offer perhaps 10,000 megohms resistance, more or less (a megohm equals a million ohms), but during a long continued rain this high degree of resistance falls, sometimes as low as 9 or 10 megohms, and often lower—even below one megohm, but then it quickly regains a portion of its insulating power as its surface becomes dry. I presume from long experience, and many careful tests made in the worst weather, that 9 megohms will be above the average value of three quarters of the insulators used in this country in the Middle and Northern States, in long continued heavy storms.

Some of your insulators, when new, will show tests as high as 50,000 to 100,000 megohms, and that too in damp weather, and even after six or seven months exposure they rarely fall below two or three thousand megohms; I have tested some as low as fifteen or sixteen hundred. The subjoined tables will show that so high insulation as this will enable the lines which use them to work to greater distances than have been hitherto practicable.

Since a portion of the current leaks from a line at every insulator, it will come to pass that at some distance, depending upon the conductivity and insulation of the line, so much of the current will have escaped that what remains will be unable to affect the receiving instrument. For example, take a No. 9 iron wire, conductivity resistance 18 ohms per mile; 30 posts per mile, insulators of 4 megohms each, in worst weather; suppose the line 250 miles long, with way stations at 50, 100, 150, 200 miles distance—only about 51 per cent of the entering current will reach the first station, 26½ per cent reaches the second, 14 per cent the third, 8½ the fourth way station, and about 7 per cent reaches the terminal station.

But if the insulators used be 9 megohms insulators, 69 per cent will reach the 1st, 49 per cent the 2nd, 37 per cent the 3d, 30 per cent the 4th, and 28 per cent the terminal station—nearly four times as large a proportion of the entering current reaches the far end with the 9 as with the 4 megohm insulators.

If now you should build lines of 50, 100, 150, 200, 250 miles in length, the terminal currents would be 93, 76, 57, 41, and 28 per cent of the entering currents for the 9 megohm insulator, but with the 4 megohm insulator they would be 81, 49, 26, 13 and 7 per cent. These results I will throw together in tables No. 1 and 2.

In order to show what distances can be reached by the use of different insulating powers on a similar line, I subjoin table No. 3, in which the second horizontal line shows to what distance one-tenth of the entering current will reach with insulators of the several powers as noted in the several columns from the second to the ninth inclusive. Line third shows similarly to what distance ¼ of the current will reach, line fourth same of ½, line fifth same of ¾, line 6th same of 9-10. Comparing the 8th and 9th column of this table with the second, third, and fourth, will show more graphically to the eye, than words to the ear, what the Brooks insulator can do.

Truly yours,

MOSES G. FARMER,  
Consulting Electrical Engineer,  
Boston, Mass.

April 9th, 1869.

**BISHOP'S PATENT****BALATA INSULATION****FOR TELEGRAPH AND ELECTRIC WIRES.**

We are now prepared to furnish wire insulated with this new and valuable material, which, from the time in which we have had of test its merits, proves to be

VERY TOUGH AND PLIABLE,

WILL NOT BECOME BRITTLE,

WILL NOT CRACK,

IS NOT EASILY AFFECTED BY EXPOSURE TO THE  
WEATHER,

AND

IS A PERFECT INSULATOR.

Any size or style of Wire made to order at short notice by the  
only manufacturers,

THE BISHOP GUTTA PERCHA COMPANY.

SAMUEL C. BISHOP, General Agent,  
118 Liberty street.

**STICKWELL & CO'S**

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOUBS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND  
FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**CHESTER, PARTRICK & CO.,**

TELEGRAPHIC & ELECTRICAL ENGINEERS,

CONTRACTORS, &c.,

38 SOUTH FIFTH STREET.

PHILADELPHIA.

Manufacturers and Merchants of every variety of

TELEGRAPHIC, ELECTRIC AND PHILOSOPHICAL AP-

PARATUS, BATTERIES, WIRE, ACIDS, INSU-

LATORS, MEDICAL INSTRUMENTS,

AND SUPPLIES.

Respectfully announce that they have increased their facilities for the prompt execution of all orders with which they may be trusted, whether for the construction of any or all lines of telegraph or for the supply of apparatus or material.

Among other recent improvements, for which they have secured the sole or part agency, attention is called to the following novelties:

1.—Patent anti-trunion Key with eccentric circuit closure.

2.—Patent Self-closing anti-trunion Key.

3.—Kerite or (horn covered) copper or compound wire or cables.

4.—Covered compound out door line wire.

5.—Blasting apparatus, cartridges, batteries, &c., &c.

6.—Calcium lighting apparatus.

7.—Medical and test batteries, direct and induced currents.

8.—Apparatus for electrical measurement.

9.—Electric gongs of any desired size or weight; alarm apparatus, &c., &c.

10.—Electrical clock work and experimental apparatus of every kind.

The success of the past year and increased resources warrant the promise of dispatch in the execution of all orders, upon terms satisfactory to our customers.

# Journal of the Telegraph.

## The Line to Russia.

Although this great projected and half executed work is now spoken of as a grand failure, and, we are inclined to think, a fortunate failure to all concerned, yet it still comes up at times to the public eye in allusions which are not without interest. To some, no doubt, these references are mournful, they have an unpleasant connection with "extension stock" bought at 50, which now rests in the most breathless and inanimate sleep in a sad drawer of an unvarnished black walnut secretary. Many a sigh has that poor paper, with its half dressed Jupiter hurling dead darts from a half seen globe as if angry at being left up there in so cold a region with so scant apparel, caused. Yet the sigh might have been heavier had the work been carried through.

To preserve the memory of this undertaking in the absence of any official history, we clip the following from *Harper's Monthly*, in connection with a sketch of Whymper's recent clever and interesting book on Alaska. Whymper was a plucky young English artist who joined the Russian Telegraph expedition in 1865. He has, in addition to the book referred to, executed very elaborate survey maps of the shores of the Northern Pacific, which are as beautiful as valuable. Harper says:

"A glance at the map, or better still at a globe, will give some idea of the stupendous work thus undertaken. Its essential object was to bring London and New York within telegraphic communication. The distance, in a direct line across the Atlantic, is 74 degrees of longitude, a little more than 3,000 miles. Let us follow a dispatch from London to New York over the proposed line. Leaving the British capital it would travel southward and eastward through Germany, thence northward to St. Petersburg; thence a little south of east across the whole expanse of European and Asiatic Russia to Nicolaeval, at the mouth of the Amoor, on the Sea of Ochotak, having traversed 140 degrees of longitude, and in its southward and northward bends about 20 degrees of latitude. So far the line was already built. Here began the work of the Telegraph Company. They proposed to bend northward around the head of the Ochotak Sea, thence eastward and northward through Kamchatka, till the line struck Bering's Straits, opposite Fort Clarence, in longitude 165° west, and latitude 63° north, almost under the Arctic Circle. Thence it was to run southward through Russian America, British Columbia, Washington Territory, and Oregon to San Francisco; thence across the continent to New York. A dispatch, by this route, from London to New York would thus have traversed 286 degrees of longitude, and taking into account southern and northern deflections, nearly 80 degree of latitude, in all something more than the entire circumference of the globe.

Whether a dispatch sent over so long a series of lines, passing for so small part of the way through a country almost uninhabited, where winter lasts two-thirds of the year, and where for four months there is only from two to four hours of daylight, would be likely to reach its destination very speedily may be considered questionable. Should a break occur in the wire it might sometimes be weeks before it could be discovered and repaired. The Telegraph Company, however, seem to have had no doubts on this point. They equipped a numerous corps, divided into five parties, with a military organization, the whole under the general superintendence of Colonel Bulkley, of the United States army, then on leave of absence for this purpose. The Siberian party was under charge of Major Abaza, a Russian officer. The Yucan party, to which Mr. Whymper was specially attached, was commanded by Major Kennicott.

Mr. Whymper gives a brief but interesting sketch of the proceedings of the Siberian party. The difficulties in the way of building a telegraph line in this region are enormous. During the winter the constructing parties camped out for weeks together when the temperature was often below the freezing-point of mercury. To dig a hole for a telegraph post in ground frozen as hard as a rock was no slight task. Six of these, three feet deep, were thought to be a good day's work. When, as was often the case, the line was through a forest, the trees had to be cut down for some distance on each side; otherwise the fall of one would endanger the wire. Axes and other tools became almost as brittle as glass from the intense cold, and lost their edges when brought in contact with frozen wood. Still the company persevered for eighteen months, and had expended three millions of dollars, when in the summer of 1866 came the tidings that the Atlantic Telegraph Cable had been laid, and was in successful operation. The Western Telegraph Company abandoned its intercontinental enterprise, and recalled its employee. One can hardly wonder that these men draped in mourning the poles which they had so laboriously set up."

An ordinary magnet loses its magnetism when heated, but molten cast iron surrounded with a helix, through which a strong galvanic current is sent, becomes strongly magnetic and retains its magnetism as long as the current is continued.

It is contemplated to establish large floating vessels between the Scilly isles and Ushant, and at the south entrance of St. George's Channel, and at the extreme points of Ireland, which will be connected with the shore by telegraph cables. These ships will relieve wind-bound vessels, supplying them with food when necessary, and act as a landing place for passengers for transfer to steamers.

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DRY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use, and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDIOT BROTHERS,

No. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

## SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also, the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDIOT BROTHERS,

Agents for the American Waltham Watch,  
691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platina point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

The following is an extract from a letter from Mr. Clarence Rathbone, operating city line Albany, N. Y. Referring to the "Nonpareil Relay," he says:

"The only opportunity I have had of trying your relay is on a short line in this city having twelve or thirteen offices. In wet weather with an ordinary instrument it is necessary to change adjustment for each office, but with your relay I have found it always adjusted."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D. Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,  
Office and Factory 86 Nassau Street,  
New York City.

**L. G. TILLOTSON & Co.,**

11 DEY STREET, NEW YORK.

MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS

AND

MATERIALS OF EVERY DESCRIPTION.

General Agents for the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

The Compound Wire has now stood every test to which it can be subjected. Over twelve hundred miles of it are now in operation with the most satisfactory results.

General Agents for the Bishop Gutta Percha Co.'s

TELEGRAPH CABLES,

GUTTA PERCHA AND OTHER INSULATED WIRES.

General Agents for

PURE NITRIC AND SULPHURIC ACIDS,

Manufactured by the Lodi Chemical Works.

Importers of the best manufacture of

ENGLISH GALVANIZED WIRE.

Publishers of Prof. J. E. Smith's

MANUAL OF TELEGRAPHY.

GROVE,

CARBON,

HILL'S,

DANIELL'S,

And every description of

BATTERY ALWAYS ON HAND.

**DR. L. BRADLEY,**

No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

A side from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *A&H*, which was patented August 15, 1855. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-500th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

**BLISS, TILLOTSON & Co.,**

## Rivet the Last Pacific Rail.

BY GEORGE W. BUNGAY.

Rivet the last Pacific rail,  
With a silver hammer and golden nail;  
For over the hill and over the vale,  
The iron horse is swiftly coming.  
Along the prairies wild flowers sweet,  
With red lips kiss his flying feet,  
Wild eagles his wild scream repeat:—  
His hymn of praise the bee is humming.  
Hail to the day and deed!  
Hail to the iron steed!  
Hail to the iron rail!  
Hail to the West, all hail!

Now the rising and setting sun  
Shall see the East and West are one,  
Wherever the steed of steam shall run.  
The Union shall be forever one.  
State linked with State with iron bands,  
Hearts linked with hearts, and hands with hands,  
Hail to our broad free lakes and lands!  
Hail to our free lands!  
Hail to our free hands!  
Hail to the gold nail!  
Hail to the last rail!

Over prairies of gold and green,  
Over rivers that roll between,—  
Plumed mountains of richest sheen,  
The steam horse toils harder and harder,  
Now scaring the wild herds and flocks,  
Now thundering over granite blocks,  
Now climbing the steep shelving rocks,  
Now up the Sierra Nevada.  
Hail to the plains below!  
Hail to the peaks of snow!  
Hail to the hammer's stroke!  
Hail to the echoes woke!

From ocean to ocean the rail  
Runs over the mountain and vale,  
Which echo with blows on the nail,  
Now heard by the list'ning races.  
Hail to the pathway of nations here.  
It runs to-day through a hemisphere,  
The good time coming must now be near,  
It shines on our hope-lighted faces.  
Hail to the age of steam!  
Hail to the iron team!  
Hail to our iron bars!  
Hail to our flag of stars!

## How Merrily they Ring.

TRINITY CHURCH.

In the morning, at 11½ o'clock, the chimes of Trinity rung out their songs of rejoicing over the new tie that unites the remotest sections of the land. At noon a special service was held in the Church before a large congregation. The services consisted of a "processional hymn," special prayer, "Te Deum Laudamus," Nicene Creed, "Glory to God on High," and a "recessional hymn." At the close of the ceremonies Mr. Ayliffe again played the chimes, performing the "changes," "Hail Columbia," "Red, White, and Blue," "Child of the Regiment," "Scotch Melody," "Easter Carol," "Yankee Doodle," "Watchman, tell us of the Night," "Old Dog Tray," "Star Spangled Banner," "Old Hundred," "Home, Sweet Home."

## The Marriage of Oceans.

Eight years ago the oceans were united by electric telegraph. This made communication by rail a national demand. Now, the National Pacific Railroad is completed. Simultaneously with the last clink of the hammer upon the last spike, on Monday, May 10th, the electric wires transmitted the sound to every part of the country. By previous arrangement, the lines of the Western Union Telegraph Company were kept free, and as the hammer struck the spike the completion of the great work was flashed in a moment to all the chief cities of the Union.

### THE DAY IN NEW YORK.

This national event was celebrated in this city with all the honors. Throughout the city there was a general display of bunting. Flags floated in profusion from the City Hall, the hotels, business houses, private dwellings, and the shipping in the harbor. The City Hall of Brooklyn was gaily decorated in honor of the day.

### ANNOUNCING THE COMPLETION OF THE WORK.

In the afternoon, at precisely sixteen minutes past 3 o'clock, Mayor Hall received the following message:

PROMONTORY POINT, May 10, 1869.

To the Hon. A. Oakley Hall:

The last spike in the rail connecting the Atlantic and Pacific by rail has been driven at 3:10 P. M. to-day.

A. S. BROWN, Mayor.

Immediately a hundred guns belched forth the joy of New York that the Pacific had joined hands with the Atlantic.

The last tie was put down at Promontory Point at about 10:30 o'clock, local time.

### THE CHAMBER OF COMMERCE.

At the last meeting of the New York Chamber of Commerce it was voted to send a congratulatory message to the Chamber at San Francisco. Accordingly, yesterday morning, the Committee appointed transmitted the following:

From the Chamber of Commerce of New York to the Chamber of Commerce of San Francisco, on the completion of the Pacific Railway:

NEW YORK, May 10—1869, 10 A. M.

The Chamber of Commerce of the State of New York desires to unite at noon to-day with the Chamber of Commerce of San Francisco in grateful thanksgiving to Almighty God, the Supreme Ruler of the Universe, on the completion of the continental line of Railway, spanning the territory of the American Union, and commercially uniting two great oceans of the globe; and in solemn recognition of the manifold benefits and blessings, industrial and commercial, moral and political, national and international, of this great avenue of intercommunication.

The new highway thus opened to man, will not only develop the resources, extend the commerce, increase the power, exalt the dignity, and perpetuate the unity of our Republic, but in its broader relations, as the segment of a world-embracing circle, directly connecting the nations of Europe with those of Asia, will materially facilitate the enlightened and advancing civilization of our age.

By order of the Chamber,

SAMUEL B. RUGGLES,  
WILLIAM E. DODGE,  
GEORGE OPDYKE  
A. A. LOW,

Special  
Committee.

## An Electric Motive Power.

Mr. Greil, a French military officer, has recently made some interesting experiments with a new system of his own invention, which is totally different from all other applications of electricity as a motive power. This new system is based upon a law of physics which governs the action of currents on currents. Up to the present time all inventors applied the use of the electro-magnet to the construction of their machines, but here one of the fundamental laws of dynamic electricity is put into practice.

If two currents are passed along two parallel conductors, one of which is fixed, in the same direction, an attraction will occur, and if the currents are sent in opposite directions then a repulsion takes place. Take a voltaic battery A, the fixed conductor is  $a$ , and the moveable one  $a'$ , the result will be that attraction takes place between  $a$  and  $a'$  with a power  $f$  that depends upon the force of the battery A. Take two other batteries, B and C, of equal force to A, with their conductors  $b, b', c, c'$ ; the same phenomena of attraction will be observed, equal to a force  $f$  for each battery. Unite at one end the movable conductors  $a' b'$  and  $c'$ , and at the other end the fixed conductor  $a, b$  and  $c$ , and let the distance between the two ends be the same as that between  $a$  and  $a'$ . The movable conductor  $a'$  will be attracted not only by the fixed one  $a$ , but also by the other two fixed conductors  $b$  and  $c$ . That is, it will be attracted by a force equal to treble that of the primary force, or  $3f$ ;  $b'$  and  $c'$  will undergo the same change. The movable end of the united conductors will thus be attracted by a force equal to  $9f$ . The force  $F$  thus produced will be equal to  $9f$  against a constant expenditure of  $3d$ ,  $d$  being the expense in silver for each pair of voltaic batteries. The electric motive power alluded to is based upon this principle. In the first place, the small voltaic batteries are replaced by two large batteries called *generators*, and the bundles of conducting wires by thick bars.

The generator is composed of a large basin of ceramic sandstone of a rectangular shape, containing a porous vase of a complicated shape, in order to expose as much surface as possible. A hoop of amalgamized zinc is placed between the porous vase and the outside basin, with a mixture of acid and water. The porous vase contains a piece of coke, of the same shape, in a bath of nitric acid. The fluids are kept at equal heights by means of reservoirs placed at each end. In fact, Mr. Greil's apparatus is but a Bunsen pile of huge dimensions.

The motion is derived from the electric source. Two conductors, one of which is placed on the positive pole and the other on the negative end, in a crank, by which means the electricity is easily distributed to all parts of the machine, and even the motion can be reversed by changing the current. From thence the electric fluid passes into a movable distributor, by which the current is divided and automatically reversed. The current ends in two conducting bars that take the place of the conductors  $a$  and  $a'$  previously mentioned. These fixed conducting bars, to

the number of eighteen, are arranged so as to form the generators of a large fixed cylinder, and are bound together by cast iron hoops, from which they are isolated. The electricity passes through them all in the same sense and at the same time. On the inside of this fixed cylinder is a movable one, the generators of which are formed by twenty-four bars of metal corresponding to conductors *a*, *b* and *c*.

When six bars of the movable cylinder are set opposite six bars of the fixed cylinder, the two intermediate bars of the fixed cylinder are opposed to three bars of the movable cylinder, at a distance of five, ten and fifteen degrees of circumference, and, therefore, six series are formed around the circumference of the cylinders.

If the current circulates in the same sense and simultaneously in the bars of the fixed cylinder by causing it to enter by one of the bars of the movable cylinder, which we will call No. 1, and letting it escape by No. 3, two effects will be produced, one of attraction and one of repulsion, which will cause the movable cylinder to revolve one-fifth and place the bar No. 1 of the interior cylinder opposite the nearest bar of the exterior cylinder. The current is then put into No. 2 and let out of No. 4, giving a further motion of one-fifth, and so on. Every series will have the same effect, and being simultaneous the force will be increased.

The functions of the distributor consist in letting the current first into one bar and then into another. All the bars of the same number in the six series are united to a metallic conductor that ends in a movable distributor, giving therefore four different metallic conductors.

The distributor is a drum of wood revolving on an axle, working in prepared bearings; metal hoops are placed on the outside, some of which are entire around the circumference and others interrupted by isolators, such as ivory, &c. On one side these hoops receive the negative and positive conductors from the generator, and on the other the four conductors communicating with the bars of the movable cylinder. The motion is given to the drum by means of cog-wheels that correspond with the movable cylinder, giving it two complete turns to one of the cylinder.

Taking into consideration the question of economy by the use of such a motive power, calculations prove that the expense decreases in proportion to the square of the work produced, so that, presuming the unit to cost twenty-five times more to produce by electricity than by steam, the following table is obtained:

POWER OBTAINED. Horse Power.	EXPENDITURE	
	By Steam.	By Electricity.
2	- - - - D	D
16	- - - - 8 D	2 D
64	- - - - 16 D	3 D
250	- - - - 125 D	5 D
2,000	- - - - 1,000 D	10 D

Mr. Greil feels confident that his method can be applied very advantageously to railroads, and by means of an electro magnet of his invention, causing the electricity to work from the wheels of the machine on to the rails, he proposes to ascend any grade with the greatest facility.

#### Filial Piety.

The following conversation, which, had it come to his knowledge, the late Mr. Leech would have used as an illustration of "Life in the Mining Districts," has just been repeated to us: First Collier—there's been a foire (explosion) at Jackson's pits. Second Collier—My feyther worked there. First Collier—Yes, and he's blowed all to pieces. Second Collier—By gum; he's got my knife!—*Staffordshire Advertiser*.

## CHICAGO.

### The New Telegraph Office.

The rooms fitted up for the Western Union Telegraph Company, in the new Merchants' Insurance building, on the corner of La Salle and Washington streets, are now completed, and are among the finest devoted to telegraphic purposes in the United States. On the first floor is situated the

#### RECEIVING ROOM,

and main business room of this Company. This room has three entrances—one on La Salle street, and two by way of Washington street. It is very capacious, being 35x70 feet, and well lighted and ventilated. In the rear of this room is a large vault having four departments. The room is divided into various compartments by means of panel walls, for the use of book-keepers, clerks, and the other necessary attendants. A principal feature about this room, when furnished, will be the provision made for the messenger boys. Seats are provided for these boys, and ranged along at a convenient point, each seat having a certain number, by which its occupant shall be known. The boys will have no other name than that of the chair they occupy, save on the pay-rolls of the Company. The most perfect arrangements are made for the accommodation of those desiring to write messages, in the outside department provided for patrons.

Another principal feature of this room is the method adopted for sending written messages up to the operator's department, on the fourth floor, for the purpose of being dispatched thence over the wires. A hollow tube has been constructed, to reach from the first to the fourth floor, which is supplied with a leather box. This box fits the tube very loosely. From this hollow tube there runs a short pipe connecting with a circular bellows, at a distance of a few feet. On this pair of bellows is placed a weight, which is acted upon by means of a crank. When this crank is turned the weight is raised, and the bellows expand. The moment the hand is released from the crank the bellows discharge a volume of air, which is conveyed into the hollow tube with such force as to send the box containing the message up to the top of the building with the speed of a pistol ball.

#### THE SUPERINTENDENTS' ROOM

is on the second floor. It is 50x30 feet in extent, and very commodious and airy. This room it is designed to finish in the most perfect manner. It is to be occupied by the local and general superintendents—Gen. Anson Stager and Col. Wilson, and their attendants. It is supplied with a vault, and has all the conveniences necessary to comfort.

#### ON THE FOURTH FLOOR

the Company have six rooms, all of which are to be devoted to the purposes of their business. On the north side of the building, and in immediate proximity to the operators' department, is

#### THE RECEPTION ROOM.

This room is to be reserved exclusively for those who have business with the operators employed by the Company, and also for those who have business at a late hour of night with the operators' department, such as newspaper men and the like. It will be very nicely furnished, carpeted, and supplied with lounges, chairs, etc. This room will communicate with the operators' rooms by means of a window opening therein, where a visitor can make known his business.

The principal rooms on this floor are those devoted to the operators. The

#### GENTLEMEN'S DEPARTMENT

is a large room in the northwest corner of the building. Here is where the mechanical part of telegraph-

ing is to be performed. Here is where all the wires are to enter and to connect. In this room will be employed, a large number of men, night and day. The wires, to the number of 100, enter the centre of this room, on the Washington street side, and connect with the switch-board, situated a few feet from where the wires come in. The switch-board is very artistic and beautiful in its appearance, and contains 30,000 separate pieces of metal. It is composed of four large brass panels, and is so arranged that the men-tyro could learn how to operate it in a very short time. This is a great improvement, inasmuch as heretofore these boards have been of so complicated a construction that only a few of the most experienced could manage them.

The switch-board stands out by itself, and does not set up against the wall. As the 100 wires enter the window into the room they spread out like a fan. These wires are insulated, both for ornamental and useful purposes, and are covered a much farther distance than has been the case heretofore.

The wires are underneath the floor. The floor of this room, with the boards off, and with the number of wires running in all directions, presents much the appearance of a piano-forte uncovered.

The tables of the operators in this room are also new in most of their features. They are ranged through the middle and along the sides of the room, and are so constructed as to accommodate four at each table. The tables are each divided in the centre by a raised panel of thick glass, to prevent the confusion of sound that would otherwise occur. These tables are of handsome material and beautiful finish. These tables are so arranged as to admit of a gas pipe being cut through their centre from the blow, so that the operator can have his light very near him when he is at work.

It is proposed to have a pneumatic tube connect this room with the Board of Trade room.

In this room are also stationed the local batteries, 100 in number, all complete, and compactly arranged on shelves, with wires communicating underneath the floor to each one of the instruments on the tables.

In the rear of this room, and so arranged as to be thrown into one room, in case of exigency, is

#### THE LADIES' DEPARTMENT.

This room is to be occupied exclusively by lady operators, and is to be under female management and control. It will be provided with 30 instrument tables. It is a large and airy room, and similar in its general features to the male operators' department. This is the telegraph room that connects with the smaller stations along railroads connecting with Chicago. This department will be under the charge of Miss F. M. Wheeler.

#### THE BATTERY ROOM

next adjoins the female operators' department, and is one of the most perfect of its kind. The floor is constructed of cement, and the sink of scapstone, to prevent the corrosion occasioned by the use of acids. In the ceiling is a large dome, containing several fans, or "whirligigs," and having ventilating pipes connecting from all parts of the room, to carry off the fumes of the chemical substances used. All the other necessary equipments of a room of this character are in perfect keeping and harmony with the general features here detailed. Everything that is put into this room is acid proof. The battery-stand itself is a perfect masterpiece, containing 350 cups of Grove's battery. The wire used is copper, of the largest size, insulated, and made at the shops of the company at Ottawa.

#### THE BEST OF THIS FLOOR,

with the exception of two rooms, is devoted to conveniences for the workmen and operators. Taken al-

together, there is not an establishment in the United States which will have such elegant rooms, and splendid arrangements for carrying on its business.

#### THE OFFICERS

of the company are as follows: Anson Stager, General Superintendent; F. C. Swain, General Department Officer; Col. J. J. S. Wilson, Superintendent First District; R. C. Rankin, General Business Manager of Chicago Office.

H. C. MAYNARD, Night Chief Operator.

#### OPERATORS.

Geo. C. York,	J. N. Bradley,
F. S. Kent,	Frank D. Giles,
C. M. Greene,	J. H. Gage,

	Check Clerk. W. McMillan.

Office Boys. H. McMillan, H. N. Stone, John Kemp.

### Faraday among the Miners.

The famous philosopher and an equally renowned geologist (Sir Charles Lyell) were sent as Government commissioners to watch the inquest upon those who died by the explosion in the Haswell colliery, in 1844. Faraday cross-examined the witnesses very pertinently. Among other questions, he asked "how the rate of flow of air-current was measured." An inspector of the colliery, in reply, took a pinch of gunpowder from a box, as if it were snuff, and let it fall through the flame of a candle. His companion, with a watch, noted the time that the smoke took to travel a certain distance. The method satisfied Faraday, but he remarked on the careless handling of the powder, and asked where it was kept.

"In a bag tightly tied," was the reply. "Yes, but where do you keep the bag?" asked Faraday. "You are sitting on it," quoth the callous collier. The well-intentioned miners, not over-stocked with soft chairs, had given the commissioner their best substitute for a cushion. Faraday's agility in vacating his seat may be imagined, so may his expostulations, which (we are mildly informed) were animated and expressive. For the rest of the inquest he sat without a cushion in his chair.

### WASHINGTON.

#### The New Office of the Western Union Telegraph Company.

##### THE INTERIOR ARRANGEMENTS.

[From the National Republican, Washington.]

The new office of the Western Union Telegraph Company, on the corner of Fourteenth street and Pennsylvania avenue, Washington, is completed, and occupied by that company as their main office.

The office was planned by General T. T. Eckert, the general superintendent of the companies' lines, a gentleman whose great experience enabled him to anticipate every requirement of a complete telegraph office, and the plans have been carried out by Chas. A. Tinker, the manager of the Washington department, in the most thorough manner. The office wires have been laid, and the instruments (which were manufactured under his superintendence) have been placed in position by Mr. M. V. B. Buell, the electrician of the "northern division."

##### THE RECEIVING ROOM.

The "receiving room" is located on the ground floor fronting on Pennsylvania avenue. This room is 34 by 15 feet, divided in the middle by a handsome black walnut counter, elaborately paneled and beaded, upon which is a hammered glass screen set in a walnut sash, with two openings, through which messages for transmission are passed to the receiving clerks.

For the convenience of the public, there are solid walnut desks placed on either side the room, where message blanks, pens, ink, &c., are placed for the use of customers. The floor is inlaid with walnut and ash. The portion of the room behind the counter will be occupied by the receiving clerks, Messrs. Reynolds and King, two young gentlemen well and favorably known to the patrons of the telegraph. It has been fitted up to meet every requirement of the business, connecting directly with the delivery department in the rear, and with the operating room on the floor above by dumb waiters, speaking tubes, &c.

The manager has his desk in this room, where he will be at all times accessible to the public. Upon his desk is placed an instrument, and the wires are so arranged that, by communicating with the operating room, he can be almost instantly placed in communication with any city in the United States that is within telegraphic connection. This is so arranged as to enable parties to hold direct conversation with friends at a distance, without being compelled to go to the operating room, or the operating room being disturbed by the presence of a stranger. As for instance, a business house in New Orleans becomes embarrassed while the principal is in Washington, a telegram summons him to the telegraph office, and takes his seat by the side of Mr. Tinker, and converses with his partners in New Orleans, who are by the operator there, with almost as much freedom and readiness as if they were face to face. The interview closed, Boston, Chicago, St. Louis, or any other city, can be called in at a moment's notice.

Here, too, is Cashier Whitney, the financial man of the establishment, with his new safe, manufactured expressly to meet the requirements of his business.

A letter box opening, ingeniously constructed to work both ways, leads to the office of the Associated Press—which adjoins the telegraph office on the east—through which messages received for the Association are dropped, and through which messages for transmission are also received.

##### THE DELIVERY AND RECORD DEPARTMENT.

This is also located on the ground floor, in the rear of the receiving room. The messengers' room, adjoining, is comfortably provided with seats for the messen-

gers when not out with dispatches. At the desk fronting the door is the well-known face of John Happ, whose long experience has "delivery clerk" as familiarized him with the residence of nearly every citizen of Washington. Directly at his elbow is a pipe through which messages, recorded and enveloped, are dropped by the clerks in the operating room.

On the right of the delivery desk are the record clerks desks, where the general clerical business of the office is done. Messrs. J. C. Noyes, T. D. Allen, and Edward Curran, are the principal clerks of this branch. This department, too, is provided with speaking and drop tubes connecting with the operating room. Adjoining this room is the one in which are deposited the transmitted messages, old records, and such other papers as may be needed for future reference.

##### THE OPERATING ROOM.

This is kept entirely closed to the public. Here we also have improvements in keeping with the advances made in the telegraphic art. The monster "switch-board," into which all the wires are received, and by which they can be thrown to any instrument, and into connection with any part of the country, would probably first attract the attention of the visitor. It is placed on one side of the room, and is about six feet high and as many wide, made of hard wood, with narrow brass strips, about two inches apart, running down the whole front. Intermediate rows of "switches" run horizontally across the board. The strips are a continuation of the various "line wires" running into the office. Two, however, connect with the two main batteries.

The instrument tables are somewhat ingeniously arranged. There are eight large tables, about six feet long by three feet six inches wide, put together with iron screw bolts, making them very firm and solid; the top of the table is divided into four equal sections by plates of hammered glass about twelve inches high, with walnut rails upon the top, in which are set the hooks where messages for transmission are filed, and from whence they are taken in order and sent by the operator. The wires leading to the instruments from the switch-board are all conveyed under the floor, and pass up through a pipe to the centre of the table, from which they branch to the four sets of instruments upon each table.

A new feature for lighting at night has been introduced: a small gas-pipe passes up through the middle of the table and above the rail dividing the sections, and one light serves for the four operators. Gleason's noiseless patent lever argand burner is used, with the porcelain chimney and shade, which gives a beautiful, steady, uniform and brilliant light, and yet one peculiarly soft and not trying to the eye. This will be very grateful to the operators, who suffer more from bad lights than almost any other class of people.

At the other end of the room are placed the "combination" printing instruments. Mr. F. W. Royce, the operator upon them, is spoken of as exceedingly skillful and a rapid manipulator.

##### THE BATTERY ROOM.

The battery tables are made of strips of plank set edgewise in tiers, like a flower-stand; from these strips rise pins or standards, upon the tops of which are placed a small glass insulator, and upon this is placed a wooden cup of the size of the battery tumbler, to be supported by it. This arrangement prevents the possibility of any local connection between the cups or cells by moisture or contact. Two batteries supply the whole number of wires which pass from this office.

After a series of experiments with numerous so-called improved batteries, the company have gone back to the regular Grove battery, which has been in use ever since the introduction of the magnetic tele-

graph, as giving the most steady, reliable, and powerful current. For local batteries the "Daniels," somewhat modified and improved, is used.

The wires of the line all lead into the battery room, and are carried from thence through boxes down the side of the wall, when they are carried under the floor to the switch-board, connecting it with the various instruments. To secure against the possibility of leaks or crosses, where the wires come so closely together at the building, Mr. Buell has shown a good deal of ingenuity in securing a thorough insulation.

## OFFICE STAFF.

C. A. TINKER, General Manager.

Leonard Whitney, Cashier.

### How Lines May be Worked Successfully During an Aurora Borealis.

On the evening of the 15th of April a magnetic storm of unusual force prevailed over the entire northern section of the country, which so seriously affected the operation of the wires that, on some circuits, they could only be worked by taking off the batteries and employing the auroral current instead. The effect of this great disturbance of the earth's magnetism was manifested with particular power upon the wires between New York and Boston, and for several hours the lines upon this route depended entirely upon this abnormal power for their working current. During the prevalence of this storm, however, I operated upon two wires between the above cities by a plan which rendered them as free from the effects of these earth currents as a local circuit.

Every one has observed that the auroral current comes in waves of ever-changing polarity, corresponding in length and direction with the scintillations of the visible aurora. Sometimes these waves continue but a few seconds, and sometimes for a longer time, but their constant change of polarity prevents the successful operation of a wire, because at one moment the auroral wave may augment the strength of current on the line, while at the next it entirely neutralizes it. Therefore, it has frequently been found advisable to remove the batteries entirely and work with the auroral current alone. But the operation of the lines in this manner is very unsatisfactory, owing to the uncertain and fitful character of this force; and, therefore, any feasible plan by which the wires may be worked under such circumstances is worthy of adoption.

The plan by which I overcome the difficulties arising from the disturbance of the earth's magnetism was by disconnecting two wires from the earth at Boston, and connecting them together, while I grounded them both at New York, thus forming a loop extending from New York to Boston. As the two wires were both upon the same supports, the auroral wave traveled over each in the same direction, and by uniting the two wires at one end, the auroral influence upon one wire was made to neutralize that upon the other, and thus the wires were left entirely free. The following diagrams will illustrate the idea. The wires are drawn without batteries or any other apparatus:

Figure 1 shows two wires extending between New York and Boston, and each grounded at its termini, with the auroral current, marked by arrow heads, flowing over both in the same direction. Figure 2 shows the same wires grounded at New York, but connected together at Boston, and the arrow heads are used to show that the currents arising from the aurora cannot pass over the line thus connected, because that passing upon one wire is neutralized by that which passes upon the other, thus leaving the wire entirely free from any auroral influence. Of course it makes no difference how often the polarity of the auroral current changes, or how much the strength of this current may vary, since the direction of the current, and its strength, change as much upon one wire as the other, and therefore the current upon one always exactly equals and neutralizes the other.

G. B. PRESCOTT.

### One More Left!

The American Atlantic Cable Telegraph Company, of New York held its annual meeting at the Bank of the Commonwealth, on Tuesday, and re-elected Mr. Edward Haight, President, with the following Board of Directors:—Charles L. Frost, President of the Toledo, Peoria, and Warsaw Railroad Company; Mr. Chauncey Vibbard, Charles A. Secor, George W. Quintard, P. N. Spofford, John McGinnis, Jr., Arthur F. Willmarth, Wm. O. Stoddard, Colonel George W. Beardslee, and W. S. Worl, electrician and telegraph engineer. The report of the Board of Directors shows that the prospects of the company were highly favorable to the early establishment of an American cable, all the efforts of foreign corporations to obtain concessions from the United States Government, which foreign governments do not accord to American companies, having signally failed. The company was incorporated by the State of New York in 1866, and received its grant from Congress on the 29th of March,

1867, for the sole and exclusive right to lay, land, and operate their cables on the Atlantic coast of the United States for twenty years. Attempts have been made by foreign companies to secure this grant, but the directors are not determined to dispose of it, believing that every interest of the country demands the laying of a rival cable in which, at least, the balance of power shall be held by Americans. The negotiations with the Franco-American Company have ceased, the interests of that corporation, it is understood, having been purchased by the Newfoundland Company. The American Atlantic Company have been prepared for the last six months to lay the first line of their cable to the Bermudas, and have only been deterred from active operations by the delay of the Queen in signing the Bermuda grant, slight amendments to the charter having continually suggested themselves to the British authorities. The last amendment proposed is to the effect that the government shall take virtual possession of the line in case of any dereliction of duty on the part of the company or its officers. To this the company, of course, are not willing to accede. It is believed that the difficulty will soon be overcome, when the work will be immediately pushed forward and the first stretch of six or seven hundred miles of cable to Bermuda completed.—*N. Y. Herald.*

### A New Sensation in England.

A late London letter says:

"Professor Pepper, of the Polytechnic, having had a good run of ghosts, has taken to electricity for a new sensation, and has had constructed for him the largest induction coil in the world. The core of iron wire is five feet long, and weighs 120 pounds. The primary wire is 3,777 yards long, and weighs 145 pounds. The induction wire is 150 miles long, its whole length is wound with silk, reinforced with 477 pounds of carbonite. When the galvanic battery was first applied to this tremendous coil, it melted and burnt everything before it. Iron, brass, platinum, were all fused in one mass, and the whole affair needed to be handled with very thick gloves; but by a little coaxing and management, the thunder-storm is now tamed, drives well in harness, and fills Polytechnic audiences with astonishment. The spark, with a battery of fifty cells, is twenty-nine inches long—a burst of lightning, striking with quite a thunderous thud. It will go through five inches thickness of plate glass. Its power in the reduction of metallic oxides is, of course, quite unprecedented, and the most brilliant discoveries are confidently expected."

### Don't Like Bare-back Cavalry Service.

FORT McPHERSON, N.B.  
April 8th, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

I send you copy of a telegram received for transmission at this office this morning. The boy is evidently disgusted with the army.

Who can beat it? We challenge all operators.

"MR. — and —"

MARTINSVILLE, MORGAN CO., IND.

"Please send to Washington and git me dis charged in a half aminit for i am not able to mount bare back and am left handed in poste haste i will pay en same

B. F. W.,

2nd Cavalry Co. L."

THE last poetical story about the auroral display, is that of a correspondent of a New Haven paper, who looked at the telegraph wires and saw "sparks of electricity" hop along them like infinitesimally small illuminated toads.

### The French Cable.

[From the Ocean Wave.]

We little dreamed, at the time when we announced to our readers that there was a possibility of having the French Atlantic Cable landed on our shores, that there then existed the slightest probability of the occurrence of such an event, at least not in our day or generation. We now have it, however, from indisputable authority that the French Atlantic Cable Company will land their shore end at a point of the beach nearly fronting the new Stockton Hotel, under the sanction of the bill passed by the State Legislature at its last session. A company to connect with them, authorized by the same act, was organized at Camden on Saturday, 17th inst., of which A. W. Markley, Senator Robbins, Attorney General Robeson and other well-known gentlemen are directors. Of course there is no telling exactly to what degree Cape May will be benefited by thus converting it into an important seaport, and the grand central point from which the telegraph will radiate north, south and west, but that it will prove advantageous and immensely so, the merest numscull will readily perceive. From Cape May three main lines will deviate, one running across the bay to Lewis, on to Washington, another direct to Philadelphia, while the third is to extend along the shore north to New York. The steamer having aboard the Cable will sail from France in July, so that we may look for its arrival off our coast in the very "height of the season."

By landing the French Cable here, we shall have as one of the advantages to be derived, that now enjoyed by no other city in the United States—hearing first the electric tidings from beyond the Great Ocean.

The Philadelphia Press commenting on the contemplated event, says:—

Now is the time for Philadelphia.—Cape May is but a suburb of our city, and the proper terminus for this new Atlantic telegraph is Philadelphia.—Let us have a cable office here, and at once Philadelphia becomes not a but the newspaper centre of the country. And again, with the channel of European news under our control, we rid ourselves of that overgrown monopoly, the New York Associated Press—an incubus on American journalism.

Further, if we hold under our management the shortest line to Europe—we have no coast line to keep up and be dependent on—Philadelphia will become at once the banking centre for Government securities, and all our railroad and State stocks and bonds which are held largely across the ocean.

The Phila. N. American says:—By landing the French cable at this proximity to our city, we shall have whatever advantages are now enjoyed by New York, and some in addition; and both places will be placed under bonds for their best conduct. Undoubtedly, one of the first results will be a reduction of the onerous tariff that now prevails, and another a concurrent increase of valuable intelligence.

A Trenton daily remarks: It is possible that a better place could not have been selected upon our coast.—It is within ready distance of the great seaport town, a circumstance which may be a partial guarantee of liberal patronage, and it can easily be reached by repairing parties in case of accident.

In this connection, the able speech of Senator Stockton, just before the close of the session of Congress, has an important bearing. He says:

"I am opposed in toto to any legislation on the subject of ocean cables. There is none necessary; there is none needed. There is a general law now in existence which has been on our statute books for more than two years, which permits any company that goes to a State and gets a charter to land its cable. I should like to ask what the Congress of the United States has to do with ocean cables? Why are they

called upon? Do they own the shore, technically, over which the tide ebbs and flows? Is that the property of the United States? Is it the property of the States? The United States have some jurisdiction within a maritime league, for the purpose of protecting their coast; but have they any power, any authority whatever, to authorize or to prevent the landing of an ocean telegraph? The States have chartered companies, have created their own creatures, and they subject those creatures to the power of taxation. Now you propose—what? To take a foreign corporation. You do not propose to make it subject to United States taxation or States taxation; but you propose to take a foreign corporation and let it land their cable on your shores, and give it the right of eminent domain, which you do not possess yourself, to come and land on the shores of a State. Where do you get that power? Certainly not in the Constitution."

All this, of course, makes the City of Brotherly Love very happy, and we think that to keep peace in the family, Boston must have a cable also.

### A Phonoelectroscope.

A little instrument which I have recently contrived for the purpose of illustrating the heating power of the voltaic current, and which may be fitly called a *phono-electroscope*, consists of a rectangular wooden box, ten inches by five, two steel or platinum wires stretched from end to end, a small spindle carrying two quill plectra, and an eccentric wheel for making and breaking the current through one of the wires. The wheel turns under a brass spring, which plays upon a button. The spring is connected with one electrode of the battery, the button with the wire nearest to it, and this wire with the other electrode. To exhibit the use of the instrument: First, tighten the wires, by means of the milled-headed screws, to unison, to about the pitch of middle C; then turn the spindle so as to sound the two notes in succession before the eccentric wheel makes the circuit. After these have sounded in unison, turn the spindle a little more; the circuit is made by wheel and spring, and presently the plectra play a second time on the wires, which now sound with an interval of a tone or more, according to the quantity of electricity which has passed through one of them. By regulating the time between the instant when the wires sound in unison and the instant when they sound again, and noticing the musical interval caused by one of them becoming flat, we have an audible measure of the expansion of the connected wire, of the temperature to which it has been raised, and of the quantity of electricity which has traversed it to produce that effect. By continuing the movement, the interval between the notes will increase, and at last the wire operated on will become too slack to sound at all. If connection with the battery be now broken, and the heated wire be allowed to cool, its note will be heard to rise by degrees to its original pitch. With a single pair of plates, the phono-electroscope answers well. The experiment is a striking one in a lecture room, very instructive, and easily managed. The apparatus is so simple that any one almost may make it for himself.—EDWIN SMITH, M. A.

### The Elements in an Organ Loft.

In the organ gallery of St. Augustine's church each Sunday there is a display of electricity that is a novelty. Thunder and lightning get up the regular music of the daily services. Mr. Thunder, the organist, has secured to his instrument an electro-magnetic action, corresponding with that introduced into the organ of St. Augustine's church, in Paris, not long ago. The Stanbridge Brothers have been overhauling the instrument, and have rendered it as good as new. It has four manuals (key-boards), of which the upper one speaks to the solo organ. This part of the affair is new. The pneumatic pressure upon the valves of the pipes proved too much for the organist, and Messrs. Chester, Partrick & Co. undertook to apply to this part of the organ an electro-magnetic attachment that should make the pipes speak at the touch of the keys without the necessity for pressure. This result has been accomplished.

The work is a very pretty piece of philosophical mechanism. It is interesting to look behind the keys and see the sparks of electricity emitted as each one is touched. To open the pipes attached to the keys of the Cathedral organ a weight of five ounces is required upon each key, and in proportion to its size no organ in the world is played with a less amount of digital fatigue. This solo organ at St. Augustine's responds to the slightest touch, and a full chord is taken by the hand with as little pressure as a single key. The Stanbridges certainly deserve credit for their courage in undertaking the task, while it is not saying too much when the proper praise is given to the electricians who aided these gentlemen in proving for the five hundredth time that what can be done in Paris can be done in Philadelphia also.—*Norfolk American*.

The *Mercury* says the Messrs. Chester, Partrick & Co. deserve great credit for their transcendent skill as electricians. The organ of St. Augustine's church, in Paris, is the only one to which this electrical action was ever introduced. These gentlemen are the parties who placed in the Fidelity Insurance Company's building the telegraphic apparatus that registers the whereabouts of the six watchmen, and also the "miracle in a box" that gives the Commercial Exchange and the bankers of this city the gold quotations at the instant of their announcement by a corresponding apparatus in New York. So much for lightning music, sleepy watchmen and Deacon Partrick.

OPHELIA, Ala., April 14, 1883.

EDITOR JOURNAL OF THE TELEGRAPH.

MY DEAR SIR: While I am not an advocate of bad habits (smoking, chewing, drinking, playing billiards, "fighting the tiger," etc).

I must say that I smoke and chew, and eschew the balance, but I have a system by which I govern myself (for my own good) that interferes with no one. For instance, I make it a rule not to chew tobacco until 10 A. M., and not to smoke until after dinner. My reasons for this are,

1st. I cannot work and chew, or smoke, at one time, with any degree of comfort or pleasure.

2d. If I do smoke or chew, soon after entering my office, I get too nervous.

3d. By adopting this plan, I can break myself of the habit.

A telegraph man, or any other man, when occupied at his vocation has no business smoking, i. e., if he is busily engaged. If he has leisure, why it is his privilege to smoke. In large offices though, where there are ten, fifteen, or more operators in one room, there ought not to be any smoking, for one is apt to neglect his duties thereby. For instance (as the case often is), you call up an office, and the operator who answers is a smokist. He will answer, and say "hold," "fill pipe," or "light pipe," as case may be.

Now, Mr. Editor, that continues almost the time of transmitting a message of ten words. On the contrary, he should lay aside his pipe, or cigar, and transact his business, and, by all means, put it out of sight when waiting on a customer.

A MODERATE SMOKIST.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 8,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, MAY 15, 1869.

### Contract Stamps on Message Heads.

The announcement has been circulated somewhat extensively that the Commissioner of Internal Revenue has decided that the conditions on telegraph message blanks are liable to the stamp tax of five cents imposed upon contracts. The rumor has this foundation only: The Commissioner has been considering and discussing the subject, and although he leans to the view above indicated, he has not reached a final decision, nor made any order in the premises. The first revenue law imposed a stamp tax of three cents on telegraph messages. The mode of paying this tax was found in practice even more onerous than the tax itself. It was therefore subsequently repealed, and, in lieu thereof, a duty was imposed upon the gross receipts of the business. It is very clear that when Congress relieved messages from the three cent stamp, and substituted another tax which could be more easily and certainly collected, they did not intend to leave such messages liable to a higher stamp tax than that which had been previously imposed. This would seem to be conclusive so far as the intention of Congress is concerned. And it will hardly be claimed that taxes should be imposed by possible construction of doubtful technicalities which Congress has repealed by explicit declaration.

We shall be greatly disappointed if the Commissioner does not come to this conclusion.

### Electric Organs.

At last we have an organ in America, manipulated by the finger indeed, but the touch given to the keys by the nimble digits of the electric fire.

In 1832 a fine organ was built by Stanbridge Bros., Baltimore, for the church of St. Augustine, Philadelphia. This has recently been remodelled, and a new solo manual introduced, to be used by electro-magnetic action. This has been done, for the first time in America, by Messrs. Chester, Partrick & Co., of 38 South Fourth street, Philadelphia, whose ingenuity as electricians, and makers of electric and philosophical apparatus, is well and widely known throughout the country. At a brilliant concert given on the evening of May 6th, the programme of which is before us, the new application of the electric current to discourse sweet music was eminently successful, and excited universal admiration. It is the beginning of a new era in church music. Any one can see that there are possibilities, by the use of key-boards touched by magnetic fingers, which opens up the widest door to the richest combinations. We are glad that our friends have, by their ingenuity, opened that door in America. Pity but that time would permit some similar arrangement on a grand scale in the monster peace concert at Boston. How magnificent would it be to have every organ, throughout that city of organs, pealing out their biggest voices, in perfect time, by the one same single fingers that are appointed to play upon the one hundred cannons which are to supply the base in the National anthem.

One of the great organs of Europe, the St. Augustine, of Paris, is arranged to be performed wholly by elec-

tricity. An organist can now hear his own organ as if played by other hands. He no longer plays as the gazer of a painting does who puts his nose to the canvas. Remote from the instrument, he can sit among the spectators and hear, with pleased ears and without fatigue, the music he himself evokes. He can sit where he chooses. Indeed, we would not be surprised if organists should, when afflicted with gout, or "sewed up" by a Saturday night's debauch, tickle their organs from beside their garret sheet iron stoves, or bolstered up in bed. Organists, indeed, may put their key boards and pedal frames on wheels, splice on a sufficient length of cable, shift their battery, and have a fresh place to play in every Sunday, if it pleases them. One performer has actually discoursed sweet music on an organ *through five miles of wire*! Shade of Jubal, do you hear that?

Now, also, is it possible to dispense with "organ chambers," and place the instrument where it can be seen and heard to greatest advantage. It can also be divided. One part of the instrument can be erected in the chancel, and another at the opposite extreme of the edifice. By thus distributing the parts, one part in the roof, one part beneath an open register in the floor, another in the porch, and the main organ in the chancel, the most splendid combinations are possible, and the whole of a mighty cathedral be made resonant with answering voices, like the calling and the answering of the angels.

The touch of the electric finger-board is the lightest possible. The weakest child can evoke, with its smallest finger, the gentlest tones of the dulciana, the shrill burst of the clarion, the soft oboe, or the deep thunder of the base. The touch is instantaneous, and there is no uncertainty in it. What a luxury must it be for an organist thus to produce a majestic chorus by the merest tickle of his fingers! Every stop can be thus placed under his control, the swell pedal, as well as all the stops. We shall have a cord some day belting the earth, whose course will lie through the world's mightiest organs, and, with some Handel at the keyboard, a circling hallelujah of praise will swell out the grand chorus "Glory to God in the highest, on earth peace, good will towards men!" Amen.

### Driving the Spike.

Even to us who are familiar with the possibilities of the telegraph, and ready to believe any wonder which it may yet achieve, the account of the conversation between the operator, who officiated for the Telegraph Company at the driving of the spike the other day, and his fellows elsewhere throughout the Union, is racy and interesting. In all the large cities, New Orleans, Washington, St. Louis, New York, and Boston, a number of interested gentlemen had congregated at the offices, anxious to hear the click which was to announce that the last rail of the Pacific Railroad was laid. It seems to have been arranged to connect the wire with the spike itself as the last blow was given, so that the blow of the hammer itself would communicate its own work throughout the Union. This was easily done. The wire had only to be laid, severed, on the top of the spike, each severed end resting on a piece of paper separating it from the iron, and the hammer swung so as to touch both wires at the same time. Some equivalent arrangement was no doubt made. Of course all were eager to hear the click which married the oceans. Let us give the account of it furnished by the correspondent of the *New York Times*, at Washington:

"At 2:20 P. M., Washington time, all the telegraph offices in the country were notified by the Omaha telegraph office to be ready to receive the signals corresponding to the blows of the hammer that drove the last spike in the last rail that united New York and San Francisco with a band of iron. Accordingly Mr. Tinker, Manager of the Western Union Telegraph office, in Washington, placed a magnetic bell-sounder in the public office of that company, corner of Fourteenth street and the avenue, connected the same with the main lines, and notified the various offices that he was ready. New Orleans instantly responded, the answer being read from the bell-taps. New York did the same. At 2:27 o'clock, offices all over the country began to make all sorts of inquiries of Omaha, to which that office replied:

"To Everybody: Keep quiet. When the last spike is driven

at Promontory Point they will say "Done." Don't break the circuit, but watch for the signals of the blows of the hammer."

"At 2:27 P. M., Promontory Point, 2,400 miles west of Washington, said to the people congregated in the various telegraph offices:

"Almost ready. Hats off; prayer is being offered."

"A silence for the prayer ensued. At 2:40 the bell tapped again, and the office at the Point said:

"We have got done praying. The spike is about to be presented."

"Chicago replied:

"We understand; all are ready in the East."

"Promontory Point: All ready now; the spike will be driven. The signal will be three dots for the commencement of the blows."

"For a moment the instrument was silent; then the hammer of the magnet tapped the bell. 'One, two, three,' the signal, another pause of a few seconds, and the lightning came flashing eastward, vibrating over two thousand four hundred miles between the junction of the two roads and Washington, and the blows of the hammer upon the spike were measured instantly in telegraphic accents on the bell here. At 2:47 P. M., Promontory Point gave the signal, 'Done,' and the continent was spanned with iron."

These signals and conversation came from Promontory Point, via New York, from whence they divided to Boston and Plaster Cove, on one side, and to Washington and New Orleans on the other, without the aid of a single finger throughout the Union, save the operator at the scene of the wedding.

The largest electrical machine in this country is that made for the University of Mississippi, by Ritchie, of Boston. It consists of two plates, each six feet in diameter. Silliman in his *Physics*, and Ritchie in his catalogue, claim that this is the largest machine in the world, but this is a mistake. The machine made for the London Polytechnic Association has a plate ten feet in diameter, and is driven by a four horse-power steam-engine. The size of the plates being as the square of the diameter, it is obvious that a plate ten feet in diameter is larger than two plates each six feet in diameter, in the proportion of one hundred to seventy-two.

**ORIGIN OF THE HEAT DEVELOPED IN THE CELLS OF A BATTERY.**—According to Mr. Favre, the heat which is not found in the galvanic circuit, but confined within the cell, can only be traced to the intervention of the following circumstances, alone or united: 1st. The condensation of hydrogen on the platinum (of a Smee's couple), which becomes an obstacle to the transmission of the current. 2d. The local action due to the passage of hydrogen from the nascent to the ordinary state. 3d. The action, also local, due to the conversion into sulphate of the zinc deposited on the platinum of the couples by the electrolysis of the sulphate of zinc constantly increasing in the liquid in the cells.—*Comptes Rendus*.

**LIGHTING UP THE STOMACH.**—We find the following curious statement in a Canadian paper: "M. Milliat, in France, introduces into the stomach glass tubes of small caliber, connected with a strong battery, and containing the electrodes necessary for producing a brilliant galvanic light. Tumors or ulcers in the abdomen can thus be observed through the skin, and the interior lit up as when the feeble light of a candle renders the finger translucent."

"CAN cast-iron be rendered magnetic?" Very powerful permanent magnets have been made of cast-iron, and almost any piece of cast-iron will be attracted by a magnet. Many specimens of cast-iron fail to become magnetic, to any marked degree, by mere insertion in a helix of copper wire, through which a strong voltaic current is passing.

DURING the evening of Thursday, May 13th, another magnetic storm prevailed and was sensibly felt on all the wires radiating around New York. For the first time, we believe, the printing instruments were worked by the auroral currents, and this time on the northern circuit to Albany which was only feebly affected in the former storm.

We beg pardon for another omission of our notice of Mr. Little's inventions. Next number will fulfill our design.

## Washington and Chicago.

We devote more space than may seem to some due, to the description of the two spacious Telegraph Offices just occupied by the Western Union Telegraph Company at Washington and Chicago. Yet nothing more marks the progress of the Telegraph than these arrangements for the comfort and convenience of those who perform its labor, and the enlargement and adornment of premises for the public reception. They indicate strength, a healthy assurance of the future—success. The place of labor, as well as the place where we eat the bread of labor, should be as cheerful and health-giving as they can be made. Airy, bright, large rooms for our operators cannot fail to effect favorably the service rendered. Labor, thus surrounded, becomes a pleasure. It begets good will and good nature, both of them very important adjuncts of such a service. An operator, having thus round him the evidences of the Company's care for his comfort, will do his labor better, more correctly, more dexterously, with a brighter vim, and find his attachment to the service strengthened. These improvements mark also faith in the future. The telegraph strikes deeper roots daily in the necessities of the nation, and the Company blossoms into these evidences of enlarged public support. It has a widening mission. It has a vast work to do, an immense field yet to occupy. Even these large and spacious offices will some day become too straightened for the occupants, and new premises be necessary for an enlarged service.

For the gratification of the occupants of these magnificent offices, and their friends elsewhere, we give the names of the staff of each. That of Washington has been much reduced since the close of Congress, and does not include the auxiliary stations. The auxiliary stations at Chicago are also omitted. These we may give in a future number.

## Presentation.

A few days since we stated that our well-known and genial friend, A. M. Vanduzer, Esq., manager of the Western Union telegraph office, in this city, had resigned his position in order to engage in business at Detroit, Michigan. As soon as the matter became known among the operators, they, together with the other employees of the company, conceived the idea of making him a suitable present in token of their regard and esteem. With this in view, several of the fraternity commenced operations, and in a short time collected money sufficient to purchase a splendid gold-headed ebony cane. The top beautifully engraved to represent the foot of a deer, which is emblematic of fleetness, and very appropriate for the occasion. The presentation took place in the large operating room of the company's office, in the National Bank Building, corner of Superior and Water streets, Friday afternoon, and was a decided success. The matter had been kept a profound secret from Mr. Vanduzer, and when he was requested to repair to the operator's room he did not, even then, expect that any unusual occurrence was about to take place. Imagine his surprise when E. P. Wright, Esq., superintendent of telegraph for this district, stepped up and presented him with the beautiful piece of workmanship before named. Mr. Wright made a few appropriate remarks, but our friend Van. was so completely put out of "circuit" by the occurrence that he could not command galvanic power enough to cause his "recording apparatus" to "tick" out his thoughts. He, however, managed to adjust himself just enough to tender his heartfelt thanks for their token of respect and esteem, and said that he hoped that, although he had for nineteen years lived "on tick," that he should now be enabled to depart from the clatter consequent upon such a life.

A sumptuous lunch was then spread out, and all hands including our reporter, did full justice to the delicacies there displayed.

We understand that Mr. Vanduzer will leave Cleveland in a few days for his new field of action, and the good wishes of his numerous friends, in and out of the fraternity, goes with him.—*Cleveland Herald*.

We regret the departure of Mr. Vanduzer from the

Telegraph service. For nearly 30 years he has shared its tolls and fortunes, and commended himself to all as a gentleman of much refinement of heart and manner, and of prompt and vigorous business habits. The recognition of these qualities has led him into new pursuits. We shall be glad to hear of his happiness and success therein.

## EDITOR JOURNAL OF THE TELEGRAPH:

Will you please settle a dispute by stating in how many words you check this message:

"Sell one hundred North Western at ninety-eight."

One party says eight words, the other says only seven. Your decision to be according to the printed rules of the Western Union Company. I know I shall win the STRAWBERRIES.

There are eight distinct words in the message given.—*Ed.*

We are glad to learn that the demand for POPP'S MANUAL has been so large that a new edition will be issued in two or three weeks.

DR. RUDOLPH BRENNER has published the first part of the first volume of a series of investigations into Electro Therapeutics. This volume, extending over 250 pages, deals only with his observations on the effects of the electric stream upon the organ of hearing in its healthy and in its diseased state. The aim of his patient labors and numerous experiments is to endeavor to lay the foundation of the means of an exact diagnosis of the very different pathological conditions of the auditory nerves. He hopes to have accomplished this purpose, and to have shown also that the electric stream may be usefully employed as a means of cure in diseases of the auditory nerves.

A NEW EXCITING LIQUID FOR GALVANIC BATTERIES.—A French chemist suggests the following compound liquid for batteries. Twenty parts of protosulphate of iron in thirty-six parts of water, seven parts of sulphuric acid, and one part of nitric acid. He declares this to be a most powerful and exciting liquid, attacking iron, zinc, and other metals without any evolution of hydrogen or binoxide of nitrogen.—*N. Y. Medical Record*.

## Married.

May 5th, at the residence of the bride's father, at Newark, N. J., by the Rev. J. C. Burgdorf, Egbert L. Hodskin, of Fairport, N. J., to Miss Libbie A. Butler, formerly telegraph operator at Fairport.

April 29th, at the residence of the bride's mother, by Rev. A. E. Taylor, Mr. William Dyer, of Philadelphia, to Miss Annie V. Wilson, of Georgetown, D. C.

April 27th, at the residence of the bride's father, on Wheeling Island, by Rev. John Moffatt, assisted by Rev. W. M. Mullenix, Mr. A. T. McKelvey to Miss Julia S. Irwin.

## Died.

At Allentown, Pa., on Sunday P. M., May 2d, William F. Nunemacher, assistant operator for the office of the Western Union Telegraph Company.

## CHESTER, PARTRICK &amp; CO.,

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

## IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON &amp; CO., No. 11 Dey street.

## THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

## THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

## THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

**Lightning Freaks.**

A story is related in some of the books, of a young lady in full dress, at an evening party, who, when a heavy cloud was passing, went to the window and put out her hand to ascertain whether rain was falling, when the lightning, striking the house, came down by the window, and, taking her golden bracelet in its track, melted it and threw it off her arm. While not prepared to declare that such an incident as this is impossible, we should be very unwilling to vouch for the truth of the story, but prefer leaving each reader to judge of its probability or improbability for himself.

These sudden and violent discharges of large accumulations of the electric agency or force, resulting usually from the rapid condensation of vapors in the air, are far more frequent, or rather are far more frequently observed by mankind, than those faint and gentle illuminations which arise from the gradual flow of the electric force to or from projecting points. For certain reasons, a projecting point tends to draw off the electric force quietly, or convey it away as fast as it is developed, and so to prevent any great accumulation. But the light which is emitted in such cases is of so mild a character that, except under peculiar circumstances, it is seldom observed. The light is too faint to be seen in the midst of other lights; and when it is dark there is seldom any observer at hand. It is probable that if the eye of an observer could be kept near the silver or platinum points of a good lightning-rod during all the dark hours, for a considerable period of time, they would often be seen crowned with stars, or emitting pencils of mild and harmless rays.

HARRISBURG, May 5, 1869.

This morning, in the Court of Common Pleas, Dauphin county, there was tried the case of the Commonwealth vs. The Atlantic and Ohio Telegraph Company. The question at issue was of the liability of the Western Union Telegraph Company, as lessees of the Atlantic and Ohio, for taxes due the State on the dividends of the latter, and on its net earnings. The accounts were from 1864 to 1867. A verdict was rendered in favor of the Commonwealth.

**SAND-STORM.**—The *Moniteur Belge* of April 9th, mentions that at Naples, Messina, and the whole of Southern Italy, daylight, during the day of March 24th, was so obscured by the sand of the African deserts, that at Reggio, and many other places, lamp-light had to be resorted to as a means of enabling people to perform their daily work; the sand was carried by the south wind even as far as Turin. Professor Palmieri recognized the true nature of this sand by means of the microscope.

NEW YORK, April 19, 1869.

**EDITOR JOURNAL OF THE TELEGRAPH.**

In relation to the various articles that have appeared in your paper lately on "Velocipedes for Messengers," I would like to say a word or two.

Firstly, and lastly, I advise the Company to try it with one messenger, to see how it works, and if the boy is not brought back dead or wounded before dinner hour, why I think it would be safe to send out a few more the same way. But if a two-blocks' ride in West Broadway or Greenwich street would not settle them, I am not what I sign myself.

**A GOOD VELOCIPEDIST,**

Yea, verily, Greenwich street is a very poor field for the locomotion of man, beast, or velocipede.

Robert Cunningham, Manager of the New York office of the Franklin Telegraph Company, has resigned his post. Walter Seaming takes his place.

**Telegraphers' Mutual Life Insurance Company.**

The number of certificates issued is now 545. A letter from a member says: "Am about to change my location and will notify you of my address in a few days. The least word of giving up my insurance starts a 'breeze' in my family. My wife declares she will take in washing by the piece to earn money to keep up assessments sooner than lose policy." Good girl.

**THE STANDARD AMERICAN WORK ON THE TELEGRAPH.**

RUSSELL BROS., 23, 30 and 32 Centre Street,

Have just published

**MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.**

A Handbook for Electricians and Operators.

By FRANK L. POPE,

1 vol. large 8vo, with sixty illustrations.

This book supplies what has long been recognized as the great desideratum in American telegraphic literature. It is a

**THOROUGHLY PRACTICAL TREATISE**

And should be in the hands of every Electrician, Superintendent Operator, Line Builder, Repairer, and Batteryman. It contains full descriptions and explanations of all the

**MODERN IMPROVEMENTS IN TELEGRAPHING,**

Which have stood the test of actual experience. The construction and management of the different Repeaters, Switches, etc., in use in this country, is explained at length. Full explanations are given of the most approved methods of testing lines and locating faults and interruptions upon telegraph lines, accompanied by numerous diagrams. The work also contains the new system of

**TESTING BY MEASUREMENT,**

Which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines. The mode of working the

**ATLANTIC CABLE.**

And the apparatus employed will be found fully described in this book. The appendix contains a large amount of useful and practical information, formulae, tables, etc., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever requisite, with

**ELEGANT ENGRAVINGS,**

Most of which have been engraved expressly for its pages by the best artists.

**ALL TELEGRAPHERS**

Who wish to inform themselves in regard to the construction and management of the various appliances used in telegraphing such as

Batteries  
Keys,  
Relays  
Sounders,  
Registers,  
Switches,  
Lightning Arresters,  
Repeaters,  
Double Transmitters,  
Combination Locals,  
Insulators,  
Cables,  
Galvanometers,  
&c., &c., &c.,

Will find this just the work that is wanted.

Notwithstanding the great expense incurred in the publication of this work, in order to insure its general introduction, and to place it within the means of every telegrapher, relying upon large sales for remuneration, it will be issued at the low price of

**ONE DOLLAR AND A HALF.**

On receipt of the price of the book, it will, if desired, be forwarded by mail, post paid, to any part of the United States or British Provinces. Orders should in all cases be accompanied by the money to insure prompt attention, and if sent by Post office order or registered letters, will be at the risk of the publishers. Orders may be sent to the editors of THE JOURNAL OF THE TELEGRAPH or to

F. L. POPE, Box 6, 188, N. Y. City.

Other agents will be hereafter announced.

# THE HISTORY, THEORY AND PRACTICE OF THE ELECTRIC TELEGRAPH:

BY GEORGE B. PRESCOTT,

Containing upwards of One Hundred Illustrations of  
ELECTRICAL MACHINES,

TELEGRAPHIC APPARATUS, ETC.

IN ONE VOLUME. 500 PAGES. PRICE \$3 50.

Your attention is respectfully invited to the revised and enlarged edition of the above work, written by one who has been engaged for over twenty years as a practical operator and superintendent of telegraph lines, and who is familiar with both the science and art of telegraphing. It is an accurate and exhaustive work on the subject it treats, interesting and valuable at once to the general reader, the man of science, and the practical telegrapher. It presents a concise and reliable history of the invention and progress of the

**ELECTRIC TELEGRAPH,**

commencing with the first rude apparatus of Lenoir, in 1774, and describing every subsequent improvement made in the art up to the present time. The subject is treated in a scientific, and, at the same time, in a popular manner, the style being diversified, as far as possible, of scientific technicalities.

The author is confident that those who wish for a full, yet concise treatise of the

**ELECTRIC TELEGRAPH**

will find in this work precisely what they seek.

Copies sent postpaid to any address, on receipt of the advertised price.

Address

GEO. B. PRESCOTT,

Sup't Sixth District W. U. Telegraph Co.,

Albany, N. Y.

**EDISON'S****DOUBLE TRANSMITTER,**

THE MOST PRACTICAL APPARATUS OF ITS KIND YET  
INVENTED.

Complete Sets (put up in working order), price \$400, \$600, \$800.

For further information, address:

THOMAS A. EDISON,

Care CHARLES WILLIAMS, JR.

Telegraph Instrument Maker,

109 COURT STREET,

Boston, Mass.

**To the Public.**

We call attention to the following, and hope it may lead to the recovery of the property

**STOLEN**

on the night of the 7th of April:  
Western Union Telegraph Coupon Bonds, numbers and denominations as follows:

No. 17,	-	-	-	-	\$600.00
" 48,	-	-	-	-	600.00
" 187,	-	-	-	-	600.00
" 188,	-	-	-	-	600.00
" 189,	-	-	-	-	500.00
" 208,	-	-	-	-	600.00
" 842,	-	-	-	-	500.00

The public are cautioned against purchasing these Bonds, or the Coupons therefrom, as payment has been stopped.

Parties to whom they are offered are requested to hold the same and notify me; and if offered by persons unknown, or under suspicious circumstances, then to detain the parties offering the same until notice can be given to me.

A reasonable reward will be paid for their return to the owner.

WM. HUNTER,

86 Liberty street, N. Y.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
MAY 15, 1899.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since May 1, the date of the last tariff order. Please note them in your tariff book:

## REDUCTION OF TARIFF ON ATLANTIC CABLE BUSINESS.

On and after June 1, 1899, the rates of tariff on Atlantic Cable business will be as follows:

Tariff in gold, to any point in Great Britain and Ireland.

	For 10 words or less, count- ing address, date and signature.	For each word over 10
From all points in Nova Scotia, New Brunswick and New England States, and from New York City,	\$10 00	\$1 00
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Mary- land and District of Columbia,	10 40	1 04
From all points in Virginia, West Vir- ginia, North Carolina, South Caro- lina, Georgia, Alabama, Missis- sippi, Louisiana, Tennessee, Ken- tucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Co.'s offices in Florida,	11 50	1 15
From Pensacola, Fla.,	12 50	1 25
From all points in Texas, Arkansas, Missouri (except St. Louis), Kan- sas, Nebraska, Iowa, Minnesota, Colorado, Dakota, Wyoming, New Mexico, Utah, Idaho, Mon- tana, Nevada, California and Ari- zona,	13 50	1 35
From all points in Oregon, Washington Territory and British Columbia,	15 50	1 55

Note particularly that the address, date and signature must be counted and charged.

The additional tariff to places beyond Great Britain and Ireland will remain as heretofore.

## NEW OFFICES.

Campbellsburg, Henry Co., Ky., tariff same as Eminence, Ky.  
Hubbard, Mahoning Co., O., tariff same as Youngstown, O.  
Jacksonville, Ala., tariff 2.25 from Washington or Louisville  
for offices in Eastern and Central Divisions. Offices in Southern  
Division will use the rates to Jacksonville given on their tariff  
sheets.

Morley, Scott Co., Mo., offices having "Caton map" will use  
"map tariff." Tariff from all others 75c. more than to St. Louis,  
Mo.

Orrick, Mo., offices having "Caton map" will use "map tariff."  
All other offices will add 1.00 to St. Louis, 1.45 to Chicago, or 90  
to Omaha, whichever will give the lowest rate.  
Point du Chene, N. B., re-opened, tariff same as heretofore.  
Shawhan, Ky., tariff same as Paris, Ky.

## NEW OFFICES ON OTHER LINES.

West Amesbury, Mass., tariff 25 and 2 from Newburyport,  
Mass. Check Newburyport.  
Darlen, Ga., tariff 60 and 4 from Johnson Station, Ga. Check  
Johnson.

## OFFICES CLOSED.

Missouri City, Mo.

## TO OFFICES HAVING "SPECIAL SHEET A."

Tariff to Piqua, O., unless you have been otherwise instructed,  
will hereafter be the same as "special rate" to Dayton, O.

## GENERAL INFORMATION.

The name of the office heretofore known as Clappville, Mass.,  
has been changed to Rochdale, Mass.

Mt. Dallas, Pa., notice of which was given in last JOURNAL will  
hereafter be known as Bloody Run, Pa.

WILLIAM ORTON, President.

## Hours of Service.

## WESTERN UNION TELEGRAPH COMPANY.

## EASTERN DIVISION.

All offices in this Division are open for business until 8  
o'clock p. m. during the week, and from 9 to 10 o'clock  
a. m. on Sundays. In addition to this, the offices named  
below are open during the hours indicated. No office  
will be closed until the day's business has all been for-  
warded, and every office must exchange "GOOD NIGHT"  
with the office to which it reports, or to its repeating sta-  
tion or terminus of circuits on which it is located. Great  
care should be taken to procure every answer possible  
before closing.

William's Bridge, N. Y. (testing station.)

Numerous claims for damages have arisen from failure  
to observe the following rules:

- Both the sending and receiving operators will, in every case, endorse conspicuously upon every message in such manner as to be easily distinguished from the message itself, their signature, initial or initial letters, and the time sent or received.
- On messages received, the number and time must be placed at the top, and the initial letters of both sending and receiving operators at the bottom, immediately following the checks of the message. The signature of the sending operator to be entered first in all cases.
- To enable operators to comply with these requirements, and complete each message before commencing another, the receiving operator, in answering his call, will always give his office call and his personal signature or initial letter, and the sending operator will give his, immediately after the check of each message. Both personal signatures, or initials, should be noted upon every message.
- The letters "O K," with the receiver's initial or personal signature, must always be given.
- Whenever the address of the sender of a message is written, following his signature, it must in every case be transmitted and copied by the receiving operator.

THOS. T. ECKERT,  
General Supt., E. D.

## The Sewers of Paris.

Rev. Dr. Bellows included the great sewers among the sights which he made it his business to see in Paris, and gives the following account of them :

Descending a winding staircase, we found ourselves at twenty feet below the surface, in a stone tunnel, \* \* \* through the centre of which ran a channel ten feet wide and perhaps five deep, through which a stream of almost inoffensive sewage was just about emptying itself into the Seine. Suspended in the air on iron posts, ten feet above the floor, were two great pipes of the diameter of six feet each, through which the water flows that supplies certain wants of the city. Telegraph wires, enclosed in lead pipes, were also hung on the sides of the vault of the sewer. Gas pipes I looked for, but did not find, and why I cannot surmise, as there seemed ample room for them and much more. The long hall—for it seemed such—opened in several directions, and was lighted quite brilliantly with oil lamps and reflectors. \* \* \* We kept passing the numbered openings of smaller sewers, matching the streets above, and into each of these were apparently openings from each building in the street. It is said there are three hundred miles of these sewers, and if all Paris is brought into the system, there is nothing extravagant in the statement. The plan seems to be to make the sewers so large, and high and light, and to pour so much water continually through them, that it will be possible for a necessary force of men to live constantly in them (there is a day and a night watch, twelve hours each,) watching and preventing any stoppage or accumulation, any leakage or injury of any kind, either to the sewer itself, or to the pipes that carry the water, the telegraph wires, or any gas pipes that may exist in other parts of the system. \* \* \* The proof of the thorough purity of Paris above ground is the essential sweetness of the sewers themselves ; and this is proved by the fact that hundreds of workmen live here twelve hours of every day without sickness, or developing any local disease, and still more by the daily evidence that troops of ladies and gentlemen go through the sewers without spotting their garments or disgusting their senses.

Frank J. Stevens.

DALTON, GA., April 28, 1869.

EDITOR JOURNAL OF THE TELEGRAPH.

DEAR SIR—I have learned, with deep heartfelt sorrow, that my old and esteemed friend, J. Frank Stevens, one of our best operators, sank to rest on the 2d of March, 1869, and that we will see his face no more on earth. Twenty years ago, in Brownsville, Pennsylvania, I first formed the acquaintance of our deceased friend. A young lad—he took me to his kindly care. Ever courteous, affable and obliging, he won, and continued to preserve, the love and esteem of all who came in business relations with him. He was a perfect master of his vocation, and was (strange to say) willing and ready to impart his knowledge to poor and aspiring boys. All I know of Telegraphing I learned from this dear friend, and I can but say that his memory is a sweet odor to all those of the profession who knew him. Having heard of his death, I come and lay this simple leaf upon the grave of my early friend and instructor, with the sincere hope that he is now in direct communication with the spirits of just men, made perfect at the home office on the river of life, where, without wires or instruments, messages may be sent by immortal intuition.

Respectfully Yours,

GEO. W. ANDERSON, Operator,  
Dalton, Ga.

NEVER put off until to-morrow that which you can do to-day, and do it yourself if you can.

## SHAWK &amp; BARTON,

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES.

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.	&c.	&c.

We continue to manufacture Instruments after the favorite  
WESTERN UNION STANDARD PATTERNS,  
and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a  
COMPLETE OUTFIT OF ELECTRICAL APPARATUS,  
embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

## TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

## BISHOP'S PATENT

BALATA INSULATION

FOR TELEGRAPH AND ELECTRIC WIRES.

We are now prepared to furnish wire insulated with this new and valuable material, which, from the time in which we have had to test its merits, proves to be

VERY TOUGH AND PLIABLE,

WILL NOT BECOME BRITTLE,

WILL NOT CRACK,

IS NOT EASILY AFFECTED BY EXPOSURE TO THE  
WEATHER,

AND

IS A PERFECT INSULATOR.

Any size or style of Wire made to order at short notice by the only manufacturers,

THE BISHOP GUTTA PERCHA COMPANY.

SAMUEL C. BISHOP, General Agent,  
118 Liberty street.

## STICKWELL &amp; CO'S

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND  
FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

## CHAS. T. &amp; J. N. CHESTER,

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS.

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing *one dollar and a half and a three cent postage stamp for each application*, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

**New Galvanic Battery.**

A new battery is announced as arranged by M. P. Guyot, which may be useful for telegraphic purposes and electrical alarms. It consists of a porous earthen vessel filled with finely-powdered iron ore, in which is plunged a cylinder of gas retort charcoal and an ordinary vessel filled with concentrated solution of common salt, in which is placed a slip of zinc. The only care required to keep such a battery in order is to keep the latter vessel always full of concentrated solution. Further, the solution may be replaced by sand impregnated with it, or by salt in crystals, the humidity of the atmosphere being always sufficient to serve as a solvent. If the latter form be found to answer, the battery would be extremely convenient on shipboard, in trains, or wherever there is motion.

**SPECIAL NOTICE.**

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**BENEDIOT BROTHERS,**

No. 601 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

**SPECIAL NOTICE.**

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDIOT BROTHERS,

Agents for the American Waltham Watch,  
601 Broadway.

**DURANT'S**

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

**SELF-ADJUSTING RELAY**

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

Mr. Geo. E. Seibert, Western Union operator, 145 Broadway, New York, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a self-adjuster in every respect."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Agent for the sale of the Nonpareil Relay on the Pacific Coast, Mr. STEPHEN D. FIELD, San Francisco, Cal.

Address all orders to

CHARLES DURANT,  
Office and Factory, 86 Nassau Street,  
New York City.

**L. G. TILLOTSON & Co.,**

11 DEY STREET, NEW YORK.

MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS

AND

MATERIALS OF EVERY DESCRIPTION.

General Agents for the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

The Compound Wire has now stood every test to which it can be subjected. Over twelve hundred miles of it are now in operation with the most satisfactory results.

General Agents for the Bishop Gutta Percha Co.'s

TELEGRAPH CABLES,

GUTTA PERCHA AND OTHER INSULATED WIRES.

General Agents for

PURE NITRIC AND SULPHURIC ACIDS,

Manufactured by the Lodi Chemical Works.

Importers of the best manufacture of

ENGLISH GALVANIZED WIRE.

Publishers of Prof. J. E. Smith's

MANUAL OF TELEGRAPHY.

GROVE,

CARBON,

HILL'S,

DANIELL'S,

And every description of

BATTERY ALWAYS ON HAND.

**D. L. BRADLEY,**

NO. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-900th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

## The Telephone.

[From the Manufacturer and Builder.]

The following article is illustrated by cuts in the *Manufacturer and Builder*, which do not convey any clearer idea of the instrument than the description, and are omitted. We published a brief account of the instrument some months ago, but this is much more particular and highly interesting:

"One of the most remarkable recent inventions connected with telegraphy is the telephone, an instrument which transmits directly the pitch of a sound by means of a telegraph wire—either an air wire or submarine cable—so that, for instance, when the operator at one end of the wire sings or plays on an instrument any tune, as "Yankee Doodle," or "Hail Columbia," it will be heard and distinguished plainly at the other end. This invention may, in its present state, have no direct practical application, but be a mere scientific, although highly interesting curiosity; but who can say that it does not contain the germ of a new method of working the telegraph, or some other useful practical purpose?

"The telephone is not the result of an accidental discovery, but of a thorough study of the laws of electro-magnetism and of sound. It is founded on the fact that the difference in pitch of different tones is caused by different velocities of vibrations of the elastic sounding body; which vibrations are transmitted to and by the air with exactly the same velocity, and from the air may be communicated to a properly stretched membrane, like a piece of bladder or very thin sheet of india-rubber, stretched like a drum-head, which these also will vibrate with exactly the same velocity as the air and the original sounding body, be it the human voice, organ pipe, string, or any musical instrument. If, now, at the centre of this little drum-head there be attached a small disk of some metal not easily burned by electric currents—for instance, platinum—while at the same time a platinum point may, by means of a screw, be so adjusted as to come very nearly in contact with this small platinum disk, it is clear that, when the membrane is put in vibration, a succession of contacts between the disk and point will be produced, of which the number in each second will exactly correspond with the number of vibrations in each second of the sounding body, or the tone produced by it. That part of the apparatus which serves to send off the tune or melody consists simply of a square wooden box, provided at the side with a kind of mouth-piece, similar to that of a speaking tube, and at the top with an opening, over which the membrane just mentioned has been stretched. The small disk of platinum attached to the centre of this little drum-head is, by means of a very flexible strip of some metal that conducts well, attached to one pole of the galvanic battery, of which only one cup is represented in the figure, although for a long wire several cups will, of course, be required. The reason why this connection near the platinum disk is a flat, thin and flexible strip, is that any rigidity would interfere with the freedom of vibration of the membrane to which it is at-

tached. The point coming in contact with this small vibrating disk is connected with the ground wire, the other pole of the battery with the air wire or submarine cable. It is clear, from this explanation, that at every contact of the platinum point a wave of electricity will be sent over the wire, and as there are as many contacts as there are vibrations in every second, the number of electric waves will always be exactly equal to the number of vibrations corresponding with the pitch of each tone, be it fifty, one hundred, two hundred, or five hundred in every second.

"The instrument in which this succession of waves is made audible at the other end of the telegraph wire is founded on the fact, first investigated by Professor Henry, of the Smithsonian Institute, at Washington, that iron bars, when becoming magnetic by means of electric currents passing around them, become slightly elongated, and at the interruption of the current are at once restored to their original length. It consists of an elongated wooden box, of which the top is made of thin pine wood, similar to the sounding board of a stringed musical instrument, to which are attached two bridges, carrying long pieces of moderately thick and very soft iron wire, which for nearly their whole length are surrounded by a coil similar to the coil of the electro-magnets used in telegraphing. One end of this coil is attached to the telegraph wire, the other to the ground wire, as represented in the figure. At every instant that a contact is established at the station where the sound is produced, and a current wave thus transmitted, these wires will become magnetic, and consequently elongated, and they will be shortened again at every interruption of the current; and as these currents and interruptions succeed each other with the same velocity as the sound vibrations, the elongations and shortenings of the magnetized iron wires will succeed each other with exactly the same velocity, and, consequently, they will be thrown into a state of longitudinal vibrations corresponding with the original musical tone, which vibrations will then be communicated to the sounding board in exactly the same manner as is the case with the vibrations of the strings in all stringed instruments, thus becoming more audible at the receiving station.

"It is clear, from the foregoing explanations, that no quality of tone can be transmitted—much less can articulate words be sent—notwithstanding the enthusiastic prediction of some persons, who, when they first beheld this apparatus in operation, exclaimed that now we would talk directly through the wire. It is from its nature able to transmit only pitch and rhythm, consequently melody, and nothing more. No harmony, nor different degrees of strength or other qualities of tone can be transmitted; the receiving-instrument in fact sings the melodies transmitted as it were with its own voice, resembling the humming of an insect, regardless of the quality of the tone which produces the original tune at the other end of the wire. This instrument is a German invention, and was first exhibited in New York at the Polytechnic Association of the American Institute, by Dr. Van der Weyde. The original sounds were produced at the further extremity of the large building (the Cooper In-

stitute), totally out of hearing of the association; and the receiving instrument, standing on the table of the lecture room, produced, with its own rather nasal twang, the different tunes sung at other end of the line—rather weakly, it is true, because of the weak battery used, but very distinctly and correctly.

## Astronomical Clock for Beauvais Cathedral.

We abstract from the French journal *Les Mondes* the following:—The clock is destined to be placed within the cathedral church; it is a piece of furniture constructed according to the designs of the Rev. Father Pierart, S. J., 12 metres in height, 5 metres wide, and 2 metres deep; it contains fifty-five dial plates, and indicates eighty different things; the internal work contains 90,000 parts. The clock indicates the exact time for twenty different parts of the globe, indicates also the precise moment of the rising and setting and meridian passage of the sun and moon at Beauvais for every day of the year, and, moreover, the rising and setting of no less than 10,000 stars for the same place; besides this, other things, as saints' days, &c. At present the clock is at Paris, and may be seen in the Palais de l'Industrie. The entire work is highly spoken of, both as work of applied science and of fine art. The clock has been made, it appears, at the desire and expense of Magyar Grignonx, Bishop of Beauvais.

## On Some Applications of Electricity to Naval and Military Purposes.

BY F. A. ABEL, F.R.S., FOR. SEC. C.S.

[From Chemical News.]

The applications which electric science has received within the last few years in connection with the military and naval services are various and important. The employment of the electric light for signaling and reconnoitering purposes; the permanent establishment of telegraphic equipments by which an army in the field or at a siege is maintained in the most intimate communication with the directing powers; the employment of electric signaling arrangements in ships of war, and the accurate investigation of the ballistic force of gunpowder and other explosive agents, are among the uses to which electricity has been put in connection with war purposes; but the earliest application, and one of the most important and extensive—one, moreover, possessing great interest from industrial points of view—is the employment of electricity as an agent for exploring land and submarine mines.

The possibility of applying the electric spark to the ignition of charges of gunpowder suggested itself both to Franklin, in 1751, and to Priestley in 1767; but it was not until some years after the discovery of the electric pile by Volta, that serious attempts were made to apply electricity to mining and military purposes. The first application of the Voltaic battery in this direction was made little more than thirty years ago by French military engineers; a few years afterwards that agent was successfully applied in this country in

connection with important blasting operations, such as the destruction of Round Down Cliff at Dover, and the removal of the wrecks of the Royal George and Edgar at Spithead. The general method of operation then pursued was adhered to by military engineers in this country until very recently, and is, in fact, still occasionally employed, though it has been in great measure superseded by other systems which present very important advantages. It consists in inserting into the charge of gunpowder a short piece of thin wire, composed of a metal of inferior conducting power, such as iron or platinum, and placing this wire into connection with the circuit wires of the battery. The resistance offered to the passage of the current gives rise to the development of heat, the intensity of which is regulated by the conducting power and length and thickness of the wire. The latter may, in this way, be raised to a red heat, or even fused; and thus, by completing circuit through the wire at a desired moment, a charge of powder may be inflamed. A number of charges may be simultaneously exploded by introducing several pieces of thin wire into the circuit.

Although the employment of a Voltaic current of low tension presents obvious and great advantages over old systems of igniting charges by trains or slow-burning fuses, its application to military purposes is attended with some difficulty and uncertainty, arising out of the want of uniformity in action of the same Voltaic arrangements at different periods, the difficulties attending the transport and proper preservation of the battery and materials required for its use, the dependence for success upon care and experience in preparing and preserving the batteries, and the very considerable increase which it is necessary to make in the power of the battery when the operations to be performed involve the simultaneous explosion of a number of charges, or the ignition of gunpowder at very considerable distances from the battery.

For these reasons, soon after the first successful application of Voltaic electricity to mining purposes, the attention of military engineers on the Continent, and of others here and abroad who were specially interested in operations of this kind, became directed to the possibility of rendering electricity of high tension available for exploring purposes, whereby Voltaic batteries for mining operations, might be greatly reduced in size, if not altogether dispensed with.

In 1853, a Spanish officer, Colonel Verdu, associated himself with M. Ruhmkorff in experiments on the application of electro-magnetic induction coils to the explosion of gunpowder. The success of their experiments led Colonel Verdu to pursue them further in Spain, where he soon succeeded in firing six mines simultaneously by one element of Bunsen's battery, at a distance of upwards of three hundred yards, through the agency of the Ruhmkorff coil. The mode of operating and difficulties which Colonel Verdu had to overcome will be presently described. While the success of these operations led the military engineers in Spain, France, and Russia to pursue the development of the application of electro-magnetic induction instruments to exploring purposes, a committee of Austrian military engineers (of which Baron von Ebner was from the first a most distinguished member) was laboring to apply frictional electricity to military uses as an exploring agent, having come to the conclusion that the electro-magnetic induction apparatus was too complicated and too greatly susceptible of derangement for military uses. But little success had up to that time attended attempts to apply frictional electricity to this purpose. In 1821, Moses Shaw, of New York, succeeded in exploding several mines simultaneously by means of frictional electricity, but was foiled in his attempts to apply this agent to practical purposes, by the fact that he could

not conduct operations with any chance of success except in very dry weather. Somewhat more promising results attended several attempts in Germany between 1842 and 1845; but the prospect of practical success was not encouraging when the Austrian Committee of Engineer Officers took the matter in hand, and eventually produced a portable glass frictional electric machine, which, when in good working order, furnished results surpassing those which had been obtained with the volta-induction apparatus. Some very extensive operations were conducted with this machine; thus, fifty land charges and, afterwards, thirty-six submarine charges, were simultaneously exploded. Even, however, with all the precautions adopted, the machine was still too seriously affected by damp to be thoroughly serviceable for military purposes. But the persevering labors of Baron von Ebner eventually resulted in the production of an electric machine which was almost entirely free from the objections hitherto attached to this form of apparatus.

While the progress just indicated was being made in different parts of the Continent in the application of electricity to mining operations, but little attention was directed in this country to effecting improvements in the utilization of electricity for military purposes. In 1855, however, Sir C. Wheatstone directed the attention of Field-Marshal Sir John F. Burgoyne to the importance of instituting an experimental inquiry into the relative advantages of different sources of electricity of tension as agents for exploding gunpowder. The Ordinance Select Committee, of whom Sir C. Wheatstone and Mr. Abel were then members, were consequently instructed to pursue this inquiry; and a series of investigations was carried out, in the first instance, to a working branch of the Committee, and subsequently by Mr. Abel at Woolwich and Chatham, the results of which were eventually embodied in a report presented by the above-mentioned gentleman to the Secretary of State for War in 1860. Since then Mr. Abel, as a member of the Government Committee on Floating Obstructions, has continued systematic investigations on the applications of electricity to the explosion of mines, and especially to submarine operations, and considerable improvements and simplifications of the arrangements and appliances have resulted. Some advance has also been made on the Continent in this subject, and during the last two or three years our military engineers have acknowledged in the most practical manner the advantages to be derived from the use of electricity of tension as the agent for exploding mines, by gradually and to a very great extent abandoning the old system of operation, and by devoting considerable attention to the practical elaboration of the new systems.

The following is an outline of the results obtained up to the present day with different classes of instruments which furnish electricity of tension.

It has been stated that Colonel Verdu succeeded, in 1853, in exploding several mines simultaneously by means of a Ruhmkorff induction coil. The ignition of the gunpowder was effected in these experiments by introducing one or more small but complete interruptions into the circuit, across which the electric spark of high tension would leap upon the current being passed. This spark will inflame gunpowder, but not very readily, although its production is attended with development of heat in excess of that required; the reason being that powder requires for ignition either the close proximity of a considerable heated surface, or the continuous application of heat for a brief period, while the disruptive discharge from an induction coil consists of a series of instantaneous discharges following each other in very rapid succession. Hence a charge of gunpowder is not always instantaneously fired when the spark is passed; indeed,

unless the powder be closely confined round the wire terminals between which the spark passes, it is sometimes dispersed by the mechanical action of the spark without being exploded; and when a succession of sparks is passed simultaneously through a number of charges, it frequently happens that only a few are exploded, in which some of the grains happened to be in positions or conditions more favorable with reference to the source of heat than in other instances, where the powder would escape ignition. Colonel Verdu succeeded in increasing the certainty of simultaneous ignition of several charges, by surrounding the wire terminals with a substance much more readily inflamed than powder, the fulminate of mercury. Another source of difficulty in effecting the simultaneous ignition of a considerable number of charges by the spark from the coil, is the enfeebling effect upon the spark-discharge exerted by a number of successive small interruptions in the circuit. This was to some extent overcome by employing a fuse constructed by Messrs. Statham and Brunton, in which the space between the wire terminals was bridged over with a film of a finely divided substance—the sub sulphide of copper—the conducting power of which is sufficiently great to aid the passage of the electric discharge across the interruption, while it is at the same time readily combustible, and therefore directly promotes the ignition of the powder. Finding that, even with the combined use of this fuse and of fulminate of mercury, the power of the induction coil to explode charges simultaneously was limited, Colonel Verdu adopted the following simple arrangement: Separate small groups of mines were all connected with earth, and an insulated conducting wire connected each group with a distinct small isolated plate. By bringing these plates in very rapid succession into circuit with the coil machine, the several groups were so rapidly exploded as to produce results somewhat similar to those attainable by the really simultaneous discharge of a considerable number. Not long after this contrivance was adopted by M. Verdu, M. Savare devised another arrangement, whereby a much more rapidly successive discharge of a number of mines was accomplished through the agency of the coil. The metallic circuit which passed to the mines was divided into a number of branches, so that, upon completion of the circuit, the currents, following each other in very rapid succession, would distribute themselves through all the branches with a degree of uniformity regulated by the resistance met with in each branch. Thus, when one or more fuses were interposed in each branch of the circuit, those which happened to offer the greatest facilities for the passage of the current would be first fired, whereupon the escape of electricity in that direction would be interrupted, and the explosion of fuses in the other branches would follow. With the employment of currents following each other with the enormous rapidity with which they pass off from the induction coil machines, the discharge of a number of mines may thus be effected with a rapidity which, practically, has almost the effect of a simultaneous discharge.

The Ruhmkorff coil was used to some extent by the Russians in mining operations during the Crimean war, and some very extensive blasting operations were carried on with its aid at Cherbourg in 1854. A series of experiments was instituted at Woolwich in 1856 with two excellent induction coils, produced by M. Ruhmkorff, in the course of which various descriptions of materials were tried in the fuses, for the purpose of increasing the power of the machine to fire numbers of charges simultaneously. At that time the fulminate of mercury was found to be the best inflaming agent; but not more than twelve charges were fired simultaneously by means of the most powerful coil available and a battery of twelve cells (without

employing Verdu's or Savare's methods of explosion). One defect in this class of instrument was found to be the want of uniform action of one and the same apparatus at different periods; another was the liability to derangement of the machine, especially of the condenser. Far more successful results were afterwards obtained with the same coils and the fuse constructed at a later period of these investigations; fifteen charges were fired simultaneously with a battery of six cells and fifty charges, arranged in branch-circuit in groups of ten, were exploded with the effect of a simultaneous discharge. These results were obtained with machines produced by Ruhmkorff in 1855; but the improvements since then effected in the construction of this apparatus have reduced to insignificance the results at that time obtained with it. There is no question therefore that the Ruhmkorff coil is available for special operations of considerable magnitude; but in point of simplicity, certainty, and constancy of action, it is far surpassed by other forms of electric instruments, which will be presently noticed.

At the suggestion of Sir Charles Wheatstone, experiments were commenced in 1856 on the application of currents induced by permanent magnets to the explosion of gunpowder. The first experiments were instituted with a very large and powerful magneto-electric machine, constructed by Mr. Henley, of which the armature, carrying two powerful coils, was suddenly detached from the magnet by means of a lever. A few experiments sufficed to show that the induced current obtained even with this powerful instrument was not adequate to ignite one single charge of gunpowder with certainty. Somewhat better, but still uncertain, results were obtained with Statham's and one or two other forms of fuses existing at that time. A careful investigation was then undertaken by Mr. Abel (with the invaluable assistance of Mr. Brown, of the Chemical Department, Woolwich), into the conditions to be fulfilled in the production of a fuse which should be certain of action with the magneto-electric machine. The results of experiments indicated that a combination of comparatively high conducting power with great susceptibility to ignition appeared to be essential elements of success in a material to be used as the exploding agent in a fuse. The uniform arrangement of the poles or wire terminals in the fuse, the space between which was to be bridged over by the igniting composition, also proved a matter of great importance. A mode of constructing the fuses which ensured perfect uniformity in this respect was ultimately perfected, and has proved quite successful. A very fairly efficient fuse was obtained with the aid of the poles thus arranged, by employing as the igniting agent gunpowder impregnated with a small proportion of calcic chloride, which caused it, upon brief exposure to air, to imbibe moisture sufficient to render the gunpowder highly conducting. It is obvious, however, that, although the fuse itself was hermetically closed when complete, there must be a liability to want of uniformity in the proportion of water absorbed by the powder, and a consequent variation in the conducting power of the latter. Eventually a material was prepared (consisting of the sulphosulphide of copper, sub-sulphide of copper, and potassic chlorate) which combined the essentials of perfect certainty of action with very great sensitiveness to ignition. Henley's large magnet fired three of these fuses simultaneously with perfect certainty, while a small horse-shoe magnet with revolving armature exploded 23 in divided circuit in exceedingly rapid succession. A combination of six small compound magnets was afterwards employed, with which an exceedingly rapid succession of currents was obtained, and this apparatus exploded twenty-five fuses in divided circuit with a rapidity which to the ear had the effect of an instantaneous explosion. Even the small magneto-electric instruments

which are used for medical purposes will explode these fuses with certainty.

The application of magneto-electric machines having been successfully accomplished, a series of experiments was carried on by Mr. Abel, with the valuable aid of Colonel H. Scott, R. E., at Chatham, during the years 1857-58, on the explosion of charges, both land and submarine; and the great advantages of these instruments, as regards simplicity and permanent efficiency, over the voltaic arrangements hitherto used, was fully demonstrated. Very compact but powerful exploding instruments were constructed by Sir C. Wheatstone, and these have for the last seven or eight years received many important applications; thus, the proof of cannon at Woolwich and the firing of guns, from a safe distance, in the numerous experiments at Shoeburyness, is effected by means of Wheatstone's exploder, which is, moreover, an important adjunct in all electro-ballistic experiments, when the operator desires himself to fire a gun at a particular moment. Magneto-electric machines have also been found very useful in connection with blasting operations on land, except in instances when the absolutely simultaneous explosion of a large number of mines is required.

Since the success of Wheatstone's exploders has been fully established, several other forms of magneto-electric machines have been devised, especially on the Continent and in America. Powerful instruments similar to Wheatstone's are manufactured by Siemens and Halske, of Berlin; Markus, of Vienna, has constructed very efficient instruments, in which one separation and return of the armature to the magnet are made to explode the charges. The disadvantages of these instruments is that a succession of currents cannot be obtained from them as in the case of machines with revolving armatures; hence the number of mines which can be exploded by them in divided circuit is comparatively limited. Mr. Beardslee, an American, has also devised a modification of Wheatstone's exploder, in which the magnets are made to revolve between the armature coils, and which furnishes currents of greater quantity but lower tension than Wheatstone's. The fuse constructed by Mr. Beardslee for employment with this instrument, is similar in principle of construction to Abel's; but the materials which bridge over the space between the terminals or poles of the fuse are black-lead, with the addition of a minute quantity of some substance, apparently colloidion, which adds to the size of the scintillations produced when the current passes, and thus increases the certainty of ignition of the powder which is in close contact with the poles. These fuses are efficient with magneto-electric instruments like that of Mr. Beardslee, but they are much less delicate than the Woolwich fuses, and the number which can be simultaneously exploded is therefore much more limited. Sir C. Wheatstone has also lately constructed more powerful modifications of his original magnetic exploder, which may, at will, be made to furnish currents of greater quantity and lower tension, or to produce the high tension currents. Lastly, Mr. Ladd and Mr. Browning have produced instruments of comparatively low price, but quite powerful enough for ordinary blasting and quarrying operations. The only obstacle, but a most important one, to the general use of these machines, for the explosion of mines on land and under water is, that very slight defects in the insulation of the conducting wire which leads from the instrument to the mines are quite fatal to its exploding power. In consequence of the high tension of the current developed by these machines, and the small quantity put into circulation by even the most powerful of them, the diversion of the current from its destined course to earth is promoted by the smallest points of escape presented to it; a result which is,

moreover, facilitated by the resistance of the fuses in circuit. With care this source of failure can be guarded against in operations on land, but such is not the case with regard to submarine arrangements; while, moreover, minute defects in the coatings of the submerged wires, which would hardly influence the results at all on land, completely nullify the exploding power of the machines. Hence magneto-electric instruments are the least reliable of all electric exploding apparatus for submarine purposes.

A few experiments were instituted at Woolwich in 1857 on the employment of *frictional electricity* as an exploding agent, and especially with a small hydro-electric machine constructed for the purpose by Sir William Armstrong. As regards its power of exploding a number of charges simultaneously, when it was in good working order, it far exceeded any other instrument experimented with at that time: one hundred fuses, arranged in a single current, were frequently exploded by its means; but the great uncertainty of its action, and the difficulty of employing it in the field did not afford encouragement for a continuation of experiments with it.

The great difficulties encountered in the Austrian experiments in the attempts to employ glass frictional electric machines as exploding agents for military purposes, led Baron von Ebner to direct his attention to the production of an instrument in the construction of which glass was altogether avoided, and which might therefore be expected to be less subject to atmospheric influences. His labors in this direction were eventually crowned with success; for he found in the hard vulcanized india-rubber (known as ebonite or vulcanite) a dielectric material excellently adapted to the construction of the fractional apparatus; while by employing a sheet of vulcanized india-rubber coated with tinfoil and compactly rolled up, he obtained without the use of glass a powerful condenser, or Leyden jar arrangement. The improved machines were constructed in a very compact form (with cases excluding all the working parts from direct exposure to air) by Messrs. Siemens, of Berlin, and Lenoir, of Vienna, who exhibited specimens in England in 1862, at which time the electric machine had already received important application in the Austrian service, and had been regularly adopted for military uses. Baron von Ebner had also from the commencement of the Austrian experiments, labored assiduously at the production of an efficient fuse to be used with electricity of tension; and the Austrian service is indebted to him for a simple and thoroughly serviceable fuse, which, as regards the arrangement of its poles and the character of the igniting composition, may be said to combine the principles of the Statham and Abel fuses. Though less sensitive than the present English service electric fuse, a very considerable number may be exploded in simple circuit by the ebonite electric machine. The power of this apparatus in its portable form is nearly equal to that of the hydro-electric apparatus just now referred to, when the latter is in perfect working order. A far greater number of mines may therefore be simultaneously exploded by its means than by very large batteries or by the most powerful magneto-electric machines hitherto constructed. One hundred of Abel's fuses have frequently been simultaneously exploded with one of the portable machines, and still greater results can be obtained with a larger instrument having a battery of condensers, which was specially constructed for submarine operations by Mr. Becker, at the suggestion of Captain Maury. In very damp weather, when the most perfect glass electric machines would have been useless unless housed in a warm apartment from which the external air was as much as possible excluded, these ebonite machines have been used from time to time throughout the day with very satisfactory results.

Another important advantage which these instruments possess over magneto-electric machines consists in the fact that very considerable defects in the insulation of even submerged conducting wires do not so greatly reduce the power of the current furnished by them as to interfere with the accomplishment by its agency of the most extensive operations under water which are likely to occur in practice. Unfortunately, however, the very circumstance which constitutes its chief advantage, namely, the powerful character of the current of high tension with which it charges an insulated wire, is also a source of serious defect, to be presently noticed, which very greatly limits the applicability of these machines to naval and military purposes.

(To be continued.)

Having given place in our last number to Mr. Griel's article on a "New Motive Power," we follow it with an editorial from that excellent paper the *Journal of Mining*.

### Electricity as a Motive Power.

[From the N. Y. Journal of Mining.]

Sometime ago we touched lightly on this subject in an article entitled "Electricity and Steam." We pointed out how much more expensive the former is than the latter, for the simple reason that the source of the first power is zinc, a product of art, and of the latter coal, a product of nature, also that if we add to the difference in price, the difference in the chemical equivalent which makes six pounds of coal as effective as 64 pounds of zinc, we obtain as a result that zinc will be more than 100 times more expensive than coal. But the difference in coal is practically even more than this. For the oxidation of the zinc acids are needed, also products of art, and for the oxidation of the coal or carbon common air, a product of nature, literally costing nothing at all. Now, as there is no reason whatever to suppose that electric engines are more perfect than our best steam engines, with all the modern improvements, for the reason that our experience in manufacturing electric engines is very small, and in the steam engines very great, we may confidently assert that the continual running of an electric engine for practical purposes would at the present day cost a thousand times more than the amount incurred by a steam engine, so that the amount of power obtained from the first, at a cost of ten dollars, would be obtained from the last at a cost of only one cent.

Notwithstanding this, we see from time to time inventors—who, by the way, are often apt to forget what should be the final question in regard to all enterprises; will it pay?—basing their experiments upon our present highly expensive sources of electricity, and contriving new combinations of currents and magnets, hoping by some scientific hocus-pocus combination to obtain a miraculous effect. Some twenty years ago there was a large electric engine mania among inventors, just as there is at the present day in regard to ice and cooling machines. Scarcely a month or even a week passed that some new combination of electro-magnets of peculiar form, was not exhibited, usually patented, as each inventor supposed his combination to possess such superior advantages as to outdo all competitors in that line; often, however, the peculiarity insisted upon by the inventor, as a great advantage, turned out to be a defect, and the machine would perhaps scarcely go at all. We remember in this connection some machines remarkable for the total want of theoretical knowledge shown by the inventors. One of them had enormously elongated pole ends at the electro-magnets, the inventor erroneously supposing that their large surfaces of iron would exert great attraction, and not knowing that such elongated poles acted like attached keepers, absorbing almost all the attractive power developed by the coils; however, the machine was made on a large scale, at the expense

of several thousand dollars, and when finished, showed much less power than the simple machine—in fact, it scarcely moved at all.

In order that the uninitiated reader may fully understand all this, and what is to follow, it is only necessary to state, that when a piece of soft iron is surrounded by a coil of insulated copper wire, and an electric current passed through this wire, the iron will become a strong magnet, and lose its magnetism at once when the current is interrupted. All that is necessary, therefore, to cause intermittent attractions is an intermittent contact with the electric battery, and these attractions will cause to-and-fro motions, which by means of a crank may be changed into rotary motion; or the intermittent magnets may be placed on the circumference of a wheel, and attract similar other magnets, or as many pieces of iron; the contacts with the battery being made and broken by means of some automatic arrangement worked by the motion of the machine itself.

Numbers of such contrivances have been made, and may be seen in every physical cabinet; but in fact they are in a physical point of view mere illustrations of the properties of electro-magnets. When considered in a mechanical point of view, they are mere toys; and in reality there never was a machine of this kind yet constructed, even on a large scale, which was in reality more than a toy.

But not only these so-called electro-magnets will attract one another, or attract iron, but the currents themselves will attract each other when running in the same direction, and repel one another when running in opposite directions.

This was discovered by Ampere in France, some 40 years ago, and has given rise to a new branch of physics, called electro-dynamics. It was first applied to moving machines by Mr. Vergnes, from France, living in New York City, who had made the study of electricity a speciality, and in the ambition of his inventive genius again overlooking the great ultimate question as to cost, constructed the largest electric motive engine perhaps ever made. It was repeatedly on exhibition, and was shown in the Crystal Palace, New York, at the World's Fair in 1852. It worked admirably, and with seemingly considerable power, which, however, never was measured. It is a curious fact that in any machine of this kind the inventors always oppose most strenuously any such measurement. The battery used was enormous, many hundreds of cups and carboys of acids being in operation, so that the expense must have been ruinous.

In this machine Mr. Vergnes had wisely combined the attraction of the iron of the electro-magnets with the attraction and repulsion of the currents themselves, according to Ampere's discovery; for the reason that the attraction of the currents, or rather of the wires conducting the currents is comparatively very weak, so that quite a strong battery is required to demonstrate this attraction at all, while the attraction of electro-magnets will manifest itself most strikingly with a battery of one-hundredth part of the size of that required to cause the mere currents to attract each other. This fact is well known to every one who has ever experimented with voltaic batteries, currents, etc.

Taking all this into consideration, we cannot disguise our great surprise that the newspapers should this week contain a glowing description of a so-called newly-invented electro-motive engine of M. Griel, a French military officer, based on the action of currents on currents; asserting that all inventors thus far had confined themselves to the use of electro-magnets, and that here for the first time the laws of dynamical electricity have been brought into play.

Now the fact is, that if not in all, at least in most philosophical collections, there are pieces of apparatus, in which, on a small scale, this principle is illustrated,

and Vergnes, mentioned before, has, with many others, put this principle in practice, but found that when discarding the use of electro-magnets entirely, the most advantageous effects were lost. No doubt Mr. Griel's machine would be stronger if advantage was taken of the powerful magnetic action acquired by soft iron under the influence of electric currents, in place of confining the power to the comparatively weak attraction and repulsion produced on the pure electro-dynamic principle.

The battery described for driving this machine is identical with Bunsen's, namely amalgamated zinc, diluted sulphuric acid, porous cups, strong nitric acid and coke. It appears to be of enormous dimensions, and of course correspondingly enormous expense.

The most curious thing, however, is the calculation of Mr. Griel, by which he attempts to prove that when using steam the expense increases in direct ratio of the horse-power obtained, and that when using his machine, it will only increase somewhat as the cube-root of the power obtained, as shown in the following table given by him:

Horse-power Obtained.	EXPENSE. Steam.	Electricity.
2		
16	\$8	\$2
64	16	3
250	125	5
2000	1000	18

and conceding that for two horse-power electricity costs 25 times more than steam, when using 250 horse power it becomes equal, and for 2,000 horse power it will be four times as cheap.

Now, the fact is that electricity, in the way he obtains it, is not only 25 times, but 1,000 times more expensive than steam, and that the calculation of relative reduction of expense for greater power is entirely false and erroneous.

To crown all, he states that he can apply his machine to railroads, and by means of an electro-magnet of his invention (most wonderful) cause the electricity to wash from the wheels of the machine upon the rails and proposes to ascend any grade with the greatest facility.

It is now several years since M. Nickles, of France, who, we regret to say is recently deceased, proposed to accomplish the same thing by similar means, and about six years ago the same idea was again revived by an American inventor, who tried to prevent the slipping of the driving wheels on the rails by exactly this plan, making that part of the wheel which touched the rail a temporary electro-magnet. It was tried at great and prolonged labor and expense, but given up as totally impracticable. One French inventor goes even further, and appears to have the intention of also driving the cars forward by his machine.

It is matter for surprise that the editors and reporters of our public press, otherwise so well informed in matters political, religious and otherwise, are so little posted on scientific matters, as continually to be deceived by the pretentious claims of inventors. True men of science too often meet with cold contempt, while charlatans and deluded enthusiasts are received with almost superstitious credulity.

EFFECT OF HEAT ON THE ELECTROMOTIVE FORCE OF THE GALVANIC BATTERY.—M. CROVA.—(Cosmos.)—The results obtained by the researches of this author are the following:—1. The electromotive force of the Daniell's element decreases regularly with an increase of temperature; 2. the electromotive force of a Grove's element increases with the temperature; 3. the electromotive force of an element wherein only one liquid is applied (Smee's) is independent of the variations of temperature.

## Lightning Arresters.

SIR:—About five years ago, being then in charge of a line, three or four of the offices on which were singularly apt to be affected by lightning, my attention was repeatedly and forcibly called to the necessity of providing some means of protection for my relays.

We had been in the habit of using the old fashioned plate arrester, consisting of upper and lower brass plates about  $3 \times 2 \times \frac{1}{2}$ , with earth connections, having between them a similar plate, through which the line current was passed; but these instruments proved to be not only defective but also dangerous, for, in affording a ready "ground," the operators had become accustomed to use them largely for that purpose, making the connection between the line and earth plates with the points of their lead pencils, and these, breaking off frequently, would, with the dust from the office, constitute, in a damp atmosphere, powerful and most vexatious escapes.

For this reason the use of such arresters had been abandoned; and, as it sometimes happened that, it being a railroad wire, and we could not take the relays off the line during a storm, two or three of them would be more or less injured every few days; and it was noticeable that certain parts of the line suffered more than the balance, not because of any difference in the resistance or fusibility of the relay coils, but, as I should judge, from topographical reasons only. For these exposed stations I had made an arrester consisting of two line plates, each square on three sides, but cut triangularly on the fourth, with the apices of the two triangles very near each other. These were flush with the base board, and were set immediately over a ground plate fastened in and running the whole length of the board as shown in the

FIG. I.

annexed figures; where Fig. I. is a plan, and Fig. II. a section on the line XY. It will be seen that the two line plates A and B, make a close joint with the

FIG. II.

board D; approach each other very nearly at the centre, and at all points close to the earth plate C. The office wire was not connected to the plates directly, but to a coil of a foot or more of ordinary relay wire.

It was expected of these instruments that they would act as the plate arresters formerly used, but having an advantage over them in being tighter and less exposed to dust; that any serious amount of electricity would either fuse the coil of fine wire, or be distributed between the two plates and the earth.

I am happy to state that the apparatus was perfectly successful, no relay, so protected, having been injured. The device, however, intended to be but a temporary one, was superseded by what I am convinced is the best form of arrester yet known; and though I say this myself, yet my doing it anonymously must be evidence that no personal vanity is the cause.

Upon studying the matter, I was surprised to see that so little had been done since Steinheil constructed his elaborate system of protection; for though there have been a vast number of different forms of arresters,

the principles nearly all run in the same channel, being based upon the overcoming of the resistance of the air by powerful currents of electricity, and its passage to other and better conductors in the immediate vicinity of the charged wire. There is a curious superstition among many operators that this jumping through the air is owing to the fact that electricity always takes the shortest route to the earth; forgetting that here the "longest way around is often the shortest way home." Perhaps the first to expose this fallacy, and to show that the jump occurred merely because the air offered less resistance than a wire to currents of great tension, was Cavendish, who, in January, 1775, communicated to the Royal Society of Great Britain "An account of some attempts to imitate the effects of the torpedo by electricity," in which he says: "When a jar is electrified, and any number of different circuits are made between its positive and negative side, some electricity will necessarily pass along each; but a greater quantity will necessarily pass along those in which it meets with less resistance, than those in which it meets with more." Further on he continues: "Some electricians, indeed, seem to have supposed that the electric fluid passes only along the shortest and readiest circuit; but, beside that such a supposition would be contrary to what is observed in all other fluids, it does not agree with experience." Thus was stated Ohm's law, fifteen years before that great mathematician gave us, in his formula, the basis of modern telegraphy.

Although lightning will frequently occur of such intensity that its discharge will be effected through the atmosphere, providing the portion between the line and earth wires be but small, yet there never can be any surety in the matter; and in my own experience I have known it to discharge partially in a jump, while the remaining part destroyed the relay, so that absolute safety cannot be had. Absolute safety is had, however, by interposing between the line and relay wires a conductor offering greater resistance than either, for it is by resistance to its passage that the rapidly moving electricity is converted into, or assumes the form of, another molecular force—heat; and only in such conversion lies the danger of telegraph instruments. This is not the place to theorize on the subject of conduction, which is so intimately connected with the nature of electricity itself that it does not appear possible to understand one without comprehending the other; and both are totally unknown now; yet, without violating observed facts, the conductive capacity of a wire may be taken to be the absolute amount of electric force which it can transmit in a unit of time—say a second. To facilitate computations, English electricians have agreed upon a unit of current, which is an amount of electric force that in one second would, from a battery of one "local" cell (very nearly) flow through a resistance of about 75,000 miles of telegraph wire; the quantity that would do so is called a "Farad," in honor of Faraday. The conductive capacity of a wire decreases with its size, and varies with the metal of which it is composed; iron, for instance, can transmit but one-sixth of the amount of force that copper can in an equal time. The peculiarity of lightning is not that there is any great quantity of force, but that the velocity of its transmission is so great. Galvanic electricity has never been known to move over 40,000 miles per second, while Wheatstones' experiments put the velocity of static electricity at more than seven times that speed; so that to transmit lightning a wire is taxed, at least, forty-nine times as much as with the most intense battery currents; for not only has it to pass the electric force with seven times the rapidity, but also during the same time pass seven times as much force. It is by no means probable, however, that these figures represent the actual state of the

case, but that a much greater disparity exists. With such vast velocities the development of heat is great, and almost infinitely rapid; so great, as to cause the invisible molecules of the gases constituting the atmosphere to glow with the intensity that blinds in lightning; so rapid, as to cause the expansion that flings aerial waves into our ears and deafens us with thunder.

The conductive capacity of wires being easily calculated, we have but to place between the line and relay a wire whose capacity is less than that of the relay, and the safety of the latter is secured, providing we furnish a means of escape for the lightning; hence, a few feet of iron wire of the same gauge as the copper wire of the relay, will effectually preserve it, when properly connected and wrapped (with the necessary care to prevent escapes of ordinary currents) around a good ground wire.

Such an arrester as this may be made by any one, and is by all odds the handiest impromptu affair that can be gotten up.

Its disadvantage is that the destruction of the wire opens the line, and though readily replaced without much loss of time, yet the danger of working with bare wires in a thunder-storm will tempt most thinking operators to await a lull; and there is always the risk of careless men, who invariably suppose the circuit to be open anywhere else rather than in their own offices. Therefore the line should be closed automatically; and in that it does this, lies the merit of the arrester I have the pleasure briefly to describe.

The line wire is taken to the screw cup (L), fastened to a strip of metal on the grooved edge of a block;

from the metal strip rises a spring (S), so as to extend about a quarter of an inch above the top of the block, and drawn towards the block by a fine iron or platinum wire (f), tied to a small metallic post (P), let into a brass strip on which is placed the other screw cup (L'), by which the electricity leaves for the relay. By the pull of the wire (f), the spring (S) is held from touching the immovable upright (B), against which its tension would naturally force it. Whenever an amount of electricity sufficient to fuse (f) occurs, (S) falls against (B), and the circuit, momentarily interrupted, is removed through B, S', f', and P', attached to the same strip with P. In the figure three wires to be fused are shown, but in general two would be sufficient. When the last wire (f'') is destroyed, the circuit is completed through (B') and (H) the brass strip on which the posts P, P', P'', and P' are placed. To provide a means of escape for the lightning after the fusion of a wire, the ground plate (G) is fastened to the block immediately under the entire length of the wires; and if desired to bring the wires

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—**JAMES D. REID, Editor,**  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JUNE 1, 1869.

THE NEW CABLE TARIFF, TEN DOLLARS IN GOLD FOR TEN WORDS FROM NEW YORK TO GREAT BRITAIN, GOES INTO OPERATION TO-DAY.

### The European Business.

To-day, with a reduced tariff, and with duplicate wires from New York to London, the lines to Europe present themselves to the public. Carefully feeling their way, desiring to place the lines accessible to the largest public use on the one hand, and to preserve the enterprise from loss on the other, the management of the Atlantic Telegraph has thus far commended itself to all prudent men. The tariff now adopted seems the very minimum on which any reasonable compensation can be secured. Time will tell.

These international lines have always appeared to us fair subjects of governmental care if government has any business with such matters at all. A free governmental transit across the great oceans, with moderate private charges on the land better suits our ideas of governmental interference than the proposals to grasp at the safer and surer products of inland lines, and which are the legitimate subjects of private enterprise. For rates read the circular of the company elsewhere.

### George Little's Inventions.

There are a class of men connected with every science whose office it seems to be to provide brains for other men. Were all the facts connected with some of the most successful inventions known, it would be found that many an humble thinker, too much occupied with his investigations to be solicitous of public applause, too regardless of money to make his brain a banking house, has solved problems which made possible the introduction of great inventions, and paved the way by the suggestion of expedients, for the most wonderful applications of agencies whose capacities and applicabilities were thus made known. Even in our own limited sphere we have had the pleasure now and then of seeing our own thoughts adopted by other men, who have placidly labelled them with their own names, and we know of many others in wider spheres who thus live as roots of the fames of other men.

Very few have even heard of the gentleman whose name heads this article, and yet he has been a most important worker in the telegraphic field. In a number of London publications, which have been long in our possession, dating back to 1846, we have this made very apparent. In various ways, outside of distinct inventions which have had publicity, in pointing to others the methods by which adopted systems might be rendered more effective, Mr. Little has exerted an influence which has added to the fame of others. If all we hear be true, even Prof. Wheatstone owes not a little to Mr. Little's ingenuity, and the invention of the first sensible insulator in England, which made the telegraph there a success, and which has been little improved upon since, the telegraph managers in England did not hesitate to adopt without either pay or fame to its author. That insulator is, to-day, more in use than any other, both in Europe and America, with little change even in its form. Mr. Little made the unpardon-

able mistake of using his insulator before securing his patent. The sketch is the insulator as patented in England, August 11, 1847. It was first used on the lines of the Electric Telegraph Company in England in 1846, which, up to that time, were utterly unreliable and inefficient.

There must be now in use in the United States about three millions of insulators on essentially this same model, and were it not for their exposure to injury, and the miserable quality of the material often employed by makers, they would, not unlikely, be the only insulator now in use.

Now that paraffine has come to be recognized as one of the best known non-conductors, and possessing properties which render its use so valuable, we have wondered that some application of it has not been made in connection with this simple and popular insulator. Were it not that it softens somewhat easily in heat, the mere pouring of a portion of melted paraffine into the inverted cup of a glass insulator would provide all the obstruction to the connection of moisture between the wire and its support, which is necessary. Is it not possible to remedy this by a cup bearing paraffine which would remove this objection? Why cannot there be made a duplex inverted cup, the one sheltering from the rain, and the other holding a paraffine barrier, which would effectually insulate in all weathers?

We know it is a dangerous topic. There is nothing a superintendent shudders at so quick, and no subject more disturbs an executive committee. To suggest a new insulator is to premise a softening of the brain. Mr. Brooks has pursued his plans with vigor and been rewarded, but he has had to separate himself from all other engagements to do so. But there is not, to-day, a hearty acknowledgement of any insulator as the one for general adoption.

We cannot in this article follow Mr. Little in his other inventions. In chronographs, in lightning arresters, in visual code dials of great ingenuity, in duplex indicators by single manipulators, in devices for cutting out way stations so as to prevent messages from two main points being seen, in quantity permanent batteries self-supplying and self-purifying, Mr. Little has shown surpassing patience and skill. One of his most important inventions may yet perform essential service on long circuits. This is his floating pen, to which we cannot now make adequate reference. We shall not be surprised if it supplies the means by which the current through long cables can record visibly and rapidly the signals now seen only by radiations of light. Of this, more hereafter. We hope Mr. Little may yet, in some way, receive the reward to which his long experience, labor, ingenuity and personal qualities entitle him.

THE quarterly meeting of the board of the Western Union Telegraph Company for the declaration of the regular semi-annual dividend, will be held on Wednesday, June 2d.

### Telegraph Improvements.

It would be a gratifying task to us to record every effort made for the improvement of the art in which we labor. But some men are modestly sensitive of their work, and others regard their acquisitions as only steps to something so much better that they prefer silence until the whole has been attained. It is gratifying to know that neither modesty nor this hope of better things lessens the truth of the fact that substantial progress is being made in directions we deem most essential to ultimate success.

It will be recollected that the English electrician, C. F. Varley, Esq., visited the United States two years ago. While here he so demonstrated the value of the English rheostat, in determining under the Ohm laws the resistances of conductors, that he was induced to enter thereby into an examination of our American lines. He did not come to America on this errand as has been incorrectly asserted, but simply on a tour of pleasure and recreation, in which he naturally sought the intercourse of co-laborers in his chosen art. In the easy intercourse which followed, he showed with what marvellous precision this rheostat detected and located every fault. It was a police-silent, swift, unerring. This was especially so in the examination of magnets which, by an endeavor to render sensitive, had become serious obstructions to the conductivity of our circuits. We have to acknowledge that in this field of investigation now regarded so important, with all the acknowledged skill of our American electricians, we were behind English scientists in the machinery necessary for its prosecution. These appliances were developed there by the great problems connected with ocean telegraphy, in which the ripest engineering ability was brought into requisition, and they are now performing a most useful part in the improvement of our American lines.

In September last Gen. Eckert, whose supervision of telegraphic work is alike extensive and successful, assigned Mr. Madison Buell to the work of removing electrical defects from the lines, and re-arranging the application of battery power. To the former he was armed with the rheostat, to the latter he brought his own genius and the experience of his chief. Mr. Buell has proved himself eminently worthy of his trust.

In the arrangement of batteries it is only necessary to state that instead of 2,000 cups formerly in use in the New York central office, the number has been reduced to a little less than 600, and that not only without decreasing efficiency, but by an actual improvement in effective power.

In the removal of obstructions from conductors, the success has been equally marked. The soldering of every doubtful connection in office wires, their careful insulation, the care in the selection of material, and above all, the reduction of the resistance in magnets by reducing their size and supplying a pure copper has vastly increased the capacity of the lines. It has enabled the wires to Washington, as well as those in connection with the Atlantic cable, to work during the recent rains with a clearness most remarkable and satisfactory. Here is substantial and gratifying progress. It is a progress not more effective in the reduction of operating labor than in conferring value to telegraphic property. To bring Washington one hundred miles nearer New York than before, by improved conductors, is a far greater benefit than their expensive and encumbering multiplication.

### Married.

May 1, at the residence of the bride's mother, by the Rev. Mr. Moody, Mr. R. H. Alston, Manager Western Union Telegraph office, Avoca, Ala., formerly of Louisiana, to Miss Hattie A. Hodson, of Jacksonville, Ala.

### Died.

On Sunday, May 30, Mr. James W. Hawn, Manager of the Corn Exchange office of the Western Union Telegraph Company. May 25, at Richmond, Va., Mr. C. J. Gaines, of the Western Union Telegraph office, after an illness of six weeks. Mr. Gaines was a member of the Telegraphers' Mutual Life Insurance Association.

## OFFICIAL STATEMENT.

## Western Union Telegraph Company.

	April, 1869.	April, 1868.
Total Receipts.....	\$602,827 30	\$602,257 05
Total Expenses.....	383,844 17	356,349 18
Net Profits.....	\$218,983 13	\$245,907 87

ATTENTION is called to the circular of the President on page 153.

WESTERN UNION TELEGRAPH CO.,  
Treasurer's Office, May 31, 1869.

To Managers of Offices referred to in my order of April, 25, 1868:

The reports of weekly cash receipts, which were directed in JOURNAL of May 1, 1868, to be furnished by certain offices, have usually been telegraphed on Monday mornings, and have interfered with commercial business, particularly in the main offices.

These reports must hereafter be sent at night, and always kept out of the way of commercial business. Saturday night is the time for their transmission, and they should be invariably sent then.

O. H. PALMER,  
Treasurer.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
JUNE 1, 1869.

## Atlantic Cable Business.

We are notified of the following amendments to rules heretofore published:

## COMPOUND NAMES AND WORDS.

In messages to Great Britain and Ireland, compound names of places, including names of countries, states, islands, cities, towns, etc. and compound words, count as one word. Names of individuals, firms, vessels, streets and all other names, count for as many words as they contain.

In messages to places beyond Great Britain and Ireland, all compound names and words count for as many words as they contain.

The authorized agent of any newspaper or association of newspapers, may transmit general and political news in plain language for publication, from New York City, New England and British Provinces, to Great Britain and Ireland, at half rates. Points south and west of New York City will collect in addition, full cable rates to New York City.

## TARIFF TO PLACES BEYOND GREAT BRITAIN AND IRELAND.

On and after June 1, charge the following rates, in gold, in addition to the tariff to Great Britain:

20 words or less.		20 words or less.	
Belgium, . . . . .	\$ 63	Russia in Europe and . . . . .	2 50
France, . . . . .	84	Ionian Isles, . . . . .	
Holland, . . . . .	94	Algeria and Turkey in . . . . .	4 00
Denmark, . . . . .	1 25	Asia, . . . . .	4 25
Switzerland, . . . . .	1 46	Tripoli, . . . . .	5 63
Prussia, Austria, German . . . . .	1 50	Russia in Asia, . . . . .	5 88
States, . . . . .	1 67	Benghazi, . . . . .	7 50
Channel Isles, . . . . .	1 67	Alexandria, . . . . .	8 50
Norway and Spain, . . . . .	1 75	Cairo and Suez, . . . . .	9 00
Italy, Sicily, Portugal and . . . . .	2 00	Stations on Suez Canal, . . . . .	14 25
Sweden, . . . . .	2 00	India, . . . . .	15 25
Turkey in Europe and . . . . .	2 25	Ceylon, . . . . .	15 50
Greece, . . . . .	2 25	China, Port Galle, . . . . .	

Double rates must be charged for all government messages to points beyond Great Britain, written in code or cypher.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since May 15, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Allegan, Mich., tariff same as Kalamazoo, Mich.  
Shelby, Iowa, tariff same as Council Bluffs, Iowa.  
Beaver Falls, Pa., tariff same as New Brighton, Pa.  
Beverly, N. J., tariff same as Burlington, N. J.  
Gravel Pit, O., re-opened, tariff same as heretofore.  
Greensburg, Pa., heretofore another line office.  
Tariff as follows: 30c. more than Pittsburg; 30c. more than Harrisburg; 35c. more than Philadelphia, or 50c. more than New York; taking as the rate the lowest amount after adding as explained in previous JOURNALS.  
Ireland, Pa., tariff same as Hulton, Pa.

Janesville, Iowa, tariff same as Waverly, Iowa.  
Johnston Station, Ga., tariff same as Doctortown, Ga.  
Knob Lick, Mo. Offices having Illinois and Mississippi maps will use map tariff, all other offices will add 65c. to rate to St. Louis, Mo.

Weola, Iowa, tariff same as Council Bluffs, Iowa.  
Promontory Summit, Utah, tariff \$1.00 more than Salt Lake from offices East of Omaha, Neb.

St. Marys, Ka., tariff same as Wamego, Ka.

## NEW OFFICES ON OTHER LINES.]

New Haven, N. Y., }  
Pattersonville, Ont., tariff 35 and 2 from Buffalo, N. Y. Check Buffalo.

Campbell Ford, Ont., } Tariff 35 and 2 from Buffalo. Check  
Hastings, Ont., } Buffalo.  
Norwood, Ont., }  
Workworth, Ont., }

## OFFICES CLOSED.

Clintonville, Ill., Ft. Riley, Ka., Boyd Farm, Pa., and Picketon, O.

## TO OFFICES "HAVING SPECIAL SHEET A."

Tariff to Auburn, N. Y., unless otherwise ordered, same as special rate to Skaneateles, N. Y.

## GENERAL INFORMATION.

On and after June 1st the tariff to Johnstown, Pa., from offices whose rate to Johnstown is more than to Altoona, will be same as Altoona, or 30c. more than Pittsburg or Harrisburg. Offices whose rate to Johnstown is less than Altoona will continue to use present rate. Offices having "Special Sheet A" will use special rate to Altoona for Johnstown.

The name of the office heretofore known as Avoca, Ala., has been changed to Patons, Ala.

The tariff to Point Robinson, Ont., has been reduced to 35 and 2 from Buffalo, N. Y.

WILLIAM ORTON, President.

## The Auroral Currents.

In our issue of May 1, we stated that the currents so observable on telegraph wires during the presence of aurora borealis, was due to the disturbance of the earth's electric currents by the injection or induction of the electric clouds, and their use of the telegraph wires to restore themselves to their normal tension and condition. We said this to object to a theory which we found entertained by some of our electric writers that the currents, thus developed, were purely atmospheric. We stated also, and which we find confirmed by all European electricians, that no wire could be worked by the auroral currents without earth connections at either end, and that to prevent interference from them altogether, it was only necessary to form a complete metallic circuit. In our issue of May 15, Mr. Prescott proved the same thing, by using ground wires at one extremity, and removing them from the other, which really did not at all change the condition of the wires from that of a circuit purely metallic, but served to prove the correctness of our statement.

We were surprised, therefore, to learn that under some experiments reported to have been made by Mr. Mareau of Washington, on May 13th, working currents were obtained from auroral influences upon a metallic circuit.

The Washington Republican says: "Mr. Mareau, the chief operator of the day force of the Washington Telegraph Office, succeeded in an interesting experiment, viz., the substitution of a return wire for the ordinary grand circuit, upon which the same phenomena were observable as when the ends of the wire were connected with the earth."

Anxious to know the truth of this, and knowing the high character of Mr. Mareau, we caused inquiry to be made respecting this asserted result, which thus stultified all we had said. We learn from him that the statement was erroneous, the attempt to work a metallic circuit without earth connections having utterly failed. Our statement therefore, so far seems correct, although we would be foolish to dogmatize in a study from which much has yet to be learned.

FARADAY first obtained a spark from a temporary or electro-magnet in November, 1831. The first person who obtained the spark from a natural or permanent magnet in Great Britain was Professor Forbes, of Edinburgh. The experiment was made April 13, 1832, with a powerful natural magnet capable of supporting 170 lbs.

## Electricity Guarding the Railroads.

Superintendent McCollum of the Erie Railway, once reported to the company that he would rather have a one track railroad with the telegraph to manage it, than a two track line without it. He was among the very first to appreciate its great value.

We were present a few days ago at a gathering of interested railroad gentlemen and others to witness the operation of a signal connected with the movement of railroad switches, which gives promise of another great service by electricity to our railroad system.

On a signal station located so as to be seen at a distance of half a mile by an approaching train, is placed a large glass disk behind which hangs a red curtain. This curtain is connected by a cord to a magnet inside the signal house, which when acted upon by the electric current, elevates the curtain. When the switch is in place a white disk by day or a bright light by night are exhibited, and the trains may approach fearlessly on their way. The least derangement, however, even the dropping of the switch bolt, gives notice of danger by the falling of the curtain. It is exceedingly simple and efficient and bore the tests made admirably.

George W. Phelps, the principal of the Williamsburgh Telegraph Works and Robert Stewart, the Telegraph Superintendent of the Camden and Amboy R. R. Co., are the inventors of this new accession to the means of safety in travel, and we cannot doubt of its value for the purpose designed.

Electricity is thus finding its way to many uses both for the amusement and welfare of society. No one can tell what wonders it is yet to perform.

## Copper in Batteries Unnecessary.

Prof. Hough, of the Dudley Observatory, Albany, in a paper read before the American Association for the advancement of science at Chicago, stated that the negative metal in the Daniels battery was useful only as a conductor. Copper, therefore, is not essentially a part of that battery, lead or other metals answering equally as well.

One advantage in using lead instead of copper is in the ease with which it can be procured and bent into proper shape. The lead is also easily separated from the copper deposits when found necessary to remove it on account of the accumulation on the lead, by simple melting.

THE BISHOP GUTTA PERCHA COMPANY have removed their office from 113 Liberty street to their factory Nos. 422, 424, 426 East Twenty-fifth street, New York. The Post Office address of the Company is 1,432. Messrs. Tillotson & Co., 11 Dey street, are agents for the company, and all their goods are on exhibition and for sale there. Mr. Bishop has long been a neighbor to us, and we don't like his removal, but it will enable him personally to oversee his works, and no business is so well managed as under the master's eye. Prosperity go with you old friend. May you live a thousand years.

We were pleased to meet, a day or two ago, George H. Mumford, Esq., the general manager of the lines of the Western Union Telegraph Company on the Pacific coast. He joins ardently in the universal feeling of delight which the marriage of the oceans has inspired, and sees in it a largely increased demand on the use of the telegraph.

We regret to announce the death of James W. Hawn, one of the oldest and most skillful of our telegraphic brotherhood. He died at his home in Jersey City, on Sabbath afternoon, May 30th. Mr. Hawn has been in poor health for some time, and now has given us all his "good-night," and gone to rest. Although he had designed connecting himself with the Telegraphic Insurance Association, he had not done so when death met him.

We learn that our old friend M. L. Wood, Esq., has resigned the superintendence of the lines of the Atlantic and Pacific Telegraph Company.

Continued from page 149.

as near as possible to the ground, so as to render the resistance of the air a minimum, the plate may be coated with the silicate of soda, which, upon drying, makes a clean glassy surface and good insulation; and, further, the insulation may be improved and all escape from hygroscopic causes avoided, by the use of paraffine. When these two substances are employed, the wires *f, f', f''* may be in contact with the ground plate without the slightest escape of the line current.

It is not advisable, however, to keep arresters of any kind permanently on the line, but they should be so connected with it as to be easily thrown in or out of circuit as the weather may render necessary. I regret that my leaving the line (and the business) shortly after the first of these arresters were completed, renders me unable to give you any information of their practical results; but having met with the approval of all who have seen the models—among them several of well deserved eminence—I am encouraged to offer it to the profession through the medium of your columns, with the hope that in its present, or an improved form, it may be of value to telegraph lines and those who work them.

Respectfully, **AN EX-OPERATOR.****A Wedding and Presentation.**

COVINGTON, Ky., May 16, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

Another of our fellow operators, tired of "single blessedness," has taken unto himself a companion for life. I mean no other than our young friend J. S. Lyle, Esq., Superintendent Kentucky Central Railroad telegraph. He was married at 10 A. M., Wednesday, May 12, to Miss Wallace, of Newport, Ky. Immediately after the ceremony the happy couple took passage for Louisville, where they spent the two succeeding days, then returned to Covington. During his absence his fellow operators put their heads and means together and succeeded in getting up for him a very nice and appropriate gift in the shape of a pitcher, waiter and goblets, having on them the following inscription: "Presented to J. S. Lyle, Superintendent, by his fellow operators on the K. C. R. R., May 12, 1869."

A few hours after his arrival, the set, together with a written address suitable for the occasion, and signed by all the operators on the line, was sent to him by a messenger. Mr. L. was surprised as well as pleased with his present, and at once made a reply, which I send to you and would be pleased to have you give it a place in your columns:

COVINGTON, Ky., May 16, 1869.

To my fellow operators on the K. C. R. R., and Mr. Caton.

GENTLEMEN: I believe all newly-married men are proverbially very happy mortals, at least for a time, and old bachelors who have sojourned long in single blessedness, once caught in the meshes of matrimony, are only the more blessedly infatuated. The latter I suppose is my experience, for this morning I had thought my cup of joy quite full, but it seems good fortune had still something very nice in store for me, and this addition coming as it does in so pleasing a shape to the heart as well as to the eye, I have had to succumb to my emotions. Thus you see, gentlemen, how incapacitated from fitly expressing to you in mere words my thanks and appreciation of the kind expressions and the elegant gift of which I am the too unworthy recipient at your hands. Your kind approbation of my past course will greatly encourage me in the future, and with the same cordial relations and earnest co-operation given me in the past, we may look forward to certain success in the fulfilment of duty. This will render justice to our employer and do honor to ourselves. I regret that I cannot meet you all face to face and take each of you by the hand and thus better express how fully I appreciate the unexpected kindness. I do assure you, gentlemen, that this beautiful token of your kind remembrance will ever be preserved as a precious memento of one of the most pleasant and gratifying episodes of my life. Again thanking you I would re-echo four-fold to each one of you the many good wishes you have been so kind as to offer to me.

Very truly your brother operator,

J. S. LYLE.

**The Proposed Telegraph Line from Montreal to England.**

OTTAWA, Thursday, May 20.—Hon. Mr. Young's bill to incorporate a company to lay telegraph wires from Montreal to England, via Greenland, Iceland and Faroe Islands, was favorably received to-day by the Committee on Canals, Railways and Telegraph Lines, and adopted. Mr. Young telegraphed the result to the friends of the enterprise in Copenhagen, Denmark.

It is reported that Hon. William McDougall is to be appointed Governor of the new Province of Assiniboin in the Northwest Territory.

**A Goak on a Cincinnati Wire Worker.**

"O. K." is a young telegrapher, possessed of the usual tender susceptibilities of early manhood in relation to the fair sex. Whilom he wrought at his profession in ye smoky city known as Pittsburg. But the mutation of events induced him to shake the smut and dust of that city off his face and feet, and seek the porcine locality known as Cincinnati. But he left "ye weepyng mayden" behind to sing—

"The seas they may go dry, my love,  
The mountains may melt with the sun;  
If ever I prove false to you,  
It will be when my breath is gone!"

Of course, in their cruel separation they did as all lovers do—brought the mails into requisition, and poured their sighs and vows into each others willing ears through that unsympathetic, but convenient, medium. And further, in the course of time, the warm hearted Juliet did another very natural and womanly thing. She worked a nice pair of slippers for her Romeo to serve as a memento, a *souvenir* of their love. When nicely finished, she wrote to inform him that she had prepared a little present, and asked for instructions as how it should be sent. Now, "O. K." is not a Croesus. He is not so well provided with this world's goods as to despise the little economies that are sometimes placed within our reach. And so he bethought him of the cabilistic letters "D. H.," which when attached to an express package, or penciled on a telegram, denote that it is a "Dead Head," otherwise free of charge. So he wrote to his inamorata instructing her "to mark 'D. H.' and send by express." In due time the express package came to hand, but, oh, horror! it was C. O. D., \$1 75. The amount was reluctantly paid, accompanied by an expression very like "d—n it!" at the stupidity of the sender. But the grand climax of astonishment awaited the opening of the package, when a really nice pair of slippers presented themselves, with the well formed characters "D. H." neatly embroidered on the toe of each!

How this story got out is no matter. "O. K." was very sly about it, no doubt; but as good things "will out," somehow, as well as murder, so this was no exception to the rule.

If the operators in "C" office have noticed a nice young man trotting around the office with "D. H." slippers on, they may now know *how it happened*.

**The West Jubilant.**

Our desk is loaded with the descriptions of the universal joy with which the cities of the West received the announcement of the stroke which connected the great oceans. Some of these notices were full of poetic beauty. We cannot resist the publication of one of these, the *St. Louis Republican*. It is based on the proposal to make the descending hammer on the golden spike communicate by the wires the great event it then consummated. The *Republican* says: "Colonel Clowry, the able superintendent of the Western Union

Telegraph Company, has already arranged with Mr. C. W. Hammond, superintendent of the St. Louis Fire Alarm and Police Telegraph, to connect the wires with the fire alarm bells of this city, in accordance with the foregoing programme. The signals are expected to come at 12 o'clock to-day.

"This is a happy conceit—this concentration of the thoughts of millions by means of the subtle agencies of steam and electricity—this simultaneous jubilation by people thousands of miles apart—these nuptials of two of the grandest symbols of civilization in our day and generation. There is sublimity in the conception. Over the desert and through the rocky canon, traversing prairie and wilderness, will come the magical ambassador, striking the sullen bells and awakening a reverberating voice of psalms in the turrets of our churches to tell of the newest and most magnificent triumph of American enterprise and energy. The messenger, though using the same mediums, will not ring the 'loud alarm bells in the startled ear of night' with a 'clamorous appealing to the mercy of the fire,' but sonorously, and with majestic pomp the bells will relate a far different story. The poet says:

'There is in souls a sympathy with sounds,  
And as the mind is pitched, the ear is pleased.  
Some chord in mission with what we hear  
Is touched within us, and the heart replies.'

"This wonderful power of sound, communicated thousands of miles through a mystic thread, along which dance the fairies of the clouds, 'putting a girle round the world in forty minutes,' seems almost like a tale of enchantment, and suggests a lost chapter of the Arabian Nights. Amidst the clangor of busy life few there are who will not pause and listen to-day for the telegraphic signals announcing that the Pacific and Atlantic oceans have been connected by bands of iron."

**Pope's Modern Practice.**

We have received a number of orders for this practical and useful work, and are glad to aid its circulation. As we have said before we will mail a copy, post paid, on the receipt of the price, \$1.50. We will also send one copy free to any one who will send us five new subscribers and five dollars.

We deem it just to Mr. Pope to give the following notices:

Prof. Morse writes:

"I have had time only cursorily to examine its contents, but this examination has resulted in great gratification, especially at the fairness and unprejudiced tone of your whole work.

"Your illustrative diagrams are admirable, and beautifully executed.

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."

Professor G. W. Hough, of the Dudley Observatory, Albany, N. Y., whose ability and reputation as an electrician are well known, writes as follows, under date of Dudley Observatory, May 13th:

"I have examined with some care the new work by Mr. Pope, on the 'Telegraph,' and can not but express my pleasure and approbation for the clear and concise manner in which he has discussed the various problems incident to the application of galvanic electricity to practical telegraphy.

"This subject has become one of such magnitude that a work of this kind might have been increased to many times its present size, but in that case it would not have been as serviceable to the general reader, and would probably have failed in the object intended by the author.

"I was especially interested with the examples showing the application of Ohm's law to telegraph circuits and batteries. Any one who has studied the mode of equipment and method of working lines in this country, can not fail to conclude that a more general knowledge of this law, as applied to batteries and instruments, would tend to better practical results, as well as greater economy in the cost of working them."

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
May 21st, 1869.

## EXECUTIVE ORDER NO. 72.

On and after June 1st replies to messages via Atlantic Cable cannot be prepaid, except on business with Great Britain and Ireland.

The replies herein referred to are those which the sender of a message desires to pay for at the time of sending.

(Signed) WILLIAM ORTON,  
President.

NEW YORK, May 25, 1869.

## EXECUTIVE ORDER NO. 73.

On and after June 1, the rate to San Francisco and other places west of Omaha, having the same rate with eastern offices as San Francisco, will be, from Western Union offices within the United States, six dollars and seventy-five cents (\$6.75) currency, or five dollars (\$5.00) gold.

From Western Union offices east of the State of Maine six dollars (\$6.00) gold, or eight dollars and fifteen cents (\$8.15) currency.

From points on other lines in Canada and New Brunswick five dollars and seventy-five cents (\$5.75) gold, or seven dollars and seventy-five cents (\$7.75) currency.

From points on other lines east of New Brunswick and Nova Scotia ten dollars (\$10.00) gold.

The rates to other offices on the Pacific coast, within the United States, and which are higher than to San Francisco, will in no case exceed ten dollars (\$10.00) in-currency, or seven dollars and fifty cents (\$7.50) gold from eastern offices in the United States.

This is not intended to increase any existing rate, and where its adoption would increase the existing rate the latter will be continued.

WILLIAM ORTON,  
President.

## THE HISTORY, THEORY AND PRACTICE OF THE ELECTRIC TELEGRAPH:

BY GEORGE B. PRESCOTT,

Containing upwards of One Hundred Illustrations of

ELECTRICAL MACHINES,

TELEGRAPHIC APPARATUS, ETC.

IN ONE VOLUME. 500 PAGES. PRICE \$2 50.

Your attention is respectfully invited to the revised and enlarged edition of the above work, written by one who has been engaged for over twenty years as a practical operator and superintendent of telegraph lines, and who is familiar with both the science and art of telegraphing. It is an accurate and exhaustive work on the subject it treats, interesting and valuable at once to the general reader, the man of science, and the practical telegrapher. It presents a concise and reliable history of the invention and progress of the

### ELECTRIC TELEGRAPH,

commencing with the first rude apparatus of Loeage, in 1774, and describing every subsequent improvement made in the art up to the present time. The subject is treated in a scientific, and, at the same time, in a popular manner, the style being divested, as far as possible, of scientific technicalities.

The author is confident that those who wish for a full, yet concise treatise of the

### ELECTRIC TELEGRAPH

will find in this work precisely what they seek.

Copies sent postpaid to any address, on receipt of the advertised price.

Address

GEO. B. PRESCOTT,  
Sup't Sixth District W. U. Telegraph Co.,  
Albany, N. Y.

## THE STANDARD AMERICAN WORK ON THE TELEGRAPH.

RUSSELL BROS., 28, 30 and 32 Centre Street,

Have just published

### MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A Handbook for Electricians and Operators.

By FRANK L. POPE,

1 vol. large 8vo, with sixty illustrations.

This book supplies what has long been recognized as the great desideratum in American telegraphic literature. It is a

THOROUGHLY PRACTICAL TREATISE

And should be in the hands of every Electrician, Superintendent Operator, Line Builder, Repairer, and Batteryman. It contains full descriptions and explanations of all the

### MODERN IMPROVEMENTS IN TELEGRAPHING,

Which have stood the test of actual experience. The construction and management of the different Repeaters, Switches, etc., in use in this country, is explained at length. Full explanations are given of the most approved methods of testing lines and locating faults and interruptions upon telegraph lines, accompanied by numerous diagrams. The work also contains the new system of

### TESTING BY MEASUREMENT.

Which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines. The mode of working the

### ATLANTIC CABLE.

And the apparatus employed will be found fully described in this book. The appendix contains a large amount of useful and practical information, formulae, tables, etc., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever requisite, with

### ELEGANT ENGRAVINGS,

Most of which have been engraved expressly for its pages by the best artists.

### ALL TELEGRAPHERS

Who wish to inform themselves in regard to the construction and management of the various appliances used in telegraphing such as

Batteries  
Keys,  
Relays  
Sounders,  
Registers,  
Switches,  
Lightning Arresters,  
Repeaters,  
Double Transmitters,  
Combination Locals,  
Insulators,  
Cables,  
Galvanometers,  
&c., &c., &c.

Will find this just the work that is wanted.

Notwithstanding the great expense incurred in the publication of this work, in order to insure its general introduction, and to place it within the means of every telegrapher, relying upon large sales for remuneration, it will be issued at the low price of

ONE DOLLAR AND A HALF.

On receipt of the price of the book, it will, if desired, be forwarded by mail, post paid, to any part of the United States or British Provinces. Orders should in all cases be accompanied by the money to insure prompt attention, and if sent by Post office order or registered letters, will be at the risk of the publishers. Orders may be sent to the editors of THE JOURNAL OF THE TELEGRAPH or of THE TELEGRAPHER; or to

F. L. POPE, Box 6, 128, N. Y. City.

Other agents will be hereafter announced.

## CHESTER, PARTRICK & CO.,

Manufacturers and Dealers in all kinds of

### TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA,

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

### MODERN PRACTICE OF THE ELECTRIC TELEGRAPH,

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

### IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

### AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street

### THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

### THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

### GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the Insulation and combining Economy in Construction and Reconstruction with superiority in working.

### THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time was broken in several places.

Address—

A. MERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

# Journal of the Telegraph.

## A Telegraph Line for Business Men.

When Franklin experimented with his kite in the clouds, and drew from thence a knowledge of the lightning, his efforts were thought to be as amusing as they were harmless. When Morse harnessed the lightnings, and made of that subtle essence the most tractable and useful of servants, the world looked on in silent yet sceptical wonder. And so when Cyrus W. Field made practicable the boast of Puck, who "would put a girdle around the earth in forty minutes," the human mind had to grow up to the occasion. The subject was too vast for it.

But now all these things have become common. They are recognized as every-day facts. Still science, progress and improvement do not stand still. The Western Union Telegraph Company of this city, in addition to their many other enterprises, will soon be prepared to furnish every business man with his own private telegraph. This project will just suit Chicago, and Chicago residents generally.

The city of New York set the example in the present respect. The two great dry goods princes of that city, Stewart and Claflin, have private telegraphic communications between their private residences and places of business, which keep them advised constantly of whatever transpires.

L. B. Boomer, of this city, has a private telegraph, extending from his office on Dearborn street to his yard at the stock-yards; and the Fertilizing Company have another, extending from their office on La Salle street to their factory at Ingall's station. Many other prominent business and professional men of the city have made application to have the wires put at their private disposal.

As soon as the Western Union Telegraph Company can make the necessary arrangements, they will accommodate all who may desire private lines, putting them up at their own expense, and then charging a certain rental per annum for their use.

An instrument has lately been invented which very greatly simplifies the old process of learning telegraphic sounds and signs. By means of this new instrument, any body will be able to learn the art in a very short period of time.—*Chicago Times.*

## The Polytechnic Association on the American Institute.

Dr. Boynton, by invitation of the chair, took the platform, and spoke at some length in explanation of the comparative merits of different metals as conductors of electricity, and their constant value in the manufacture of wire for telegraphic purposes. Silver is the best conductor, but its cost is too great for the uses indicated; copper is the next best, but it is too weak; furthermore, its conductivity is destroyed by a slight alloy with certain other metals, for instance, by two per cent. of antimony. Steel has the requisite strength, but is a very poor conductor. Steel being stronger than iron, and copper having seven and one-half times the conducting power of the latter metal, the speaker claimed that the best results must be obtained by the use of a wire having the respective characteristics of steel and copper, and proceeded to describe a telegraph wire of this kind invented by Mr. M. G. Farmer, of Boston. This is a compound wire, weighing one hundred and thirty pounds to the mile, and is stated to have been used with success on the Pacific telegraph line, under circumstances where several other varieties of wire had failed. Its mode of manufacture was described as follows: Fine steel wire, cleaned in the usual way with acid, is coated

with tin by being drawn through a molten bath of that metal. Pure copper, previously prepared in thin strips, is lapped around the wire by machinery made for the purpose. After this the copper is cleaned with dilute muriatic acid, and the wire is again drawn through the bath of melted tin, which not only coats the copper with tin, but brazes it to the steel wire or core. It was asserted that not only is the conductivity of this wire several times greater than that of ordinary telegraph wire, but that from its tinned surface it is inoxidizable, and consequently durable in the extreme.

We are glad to see by our Pittsburgh papers that the charges of mismanagement of the Alleghany City Fire Alarms, under the superintendence of our old friend S. D. McCandless, has been refuted, and the irregularities found to have been caused by discontented parties tampering with the connections. We believe in our old boys, and in the good old times. There will never be better. The Alleghany City Council have passed resolutions of confidence in the management of the City Fire Alarm in its present hands. We vote "aye" on such every time.

## SHAWK & BARTON,

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES.

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials
Acids,	Switches,	Philosophical Apparatus,
&c.	&c.	&c.

We continue to manufacture Instruments after the favorite

## WESTERN UNION STANDARD PATTERNS,

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

## COMPLETE OUTFIT OF ELECTRICAL APPARATUS,

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

## TELEGRAPH LINES

of any required length, in any part of the United States, for individuals or for corporations.

Who has not used

## STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope when the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 80Z. CONE, AND  
FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor, N. Y.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## Lines in Mexico.

The telegraph line from Guadalajara to the port of Manzanillo, via Colima, has been completed, and connects Vera Cruz with the Pacific. A telegram has arrived this afternoon by this line announcing that near Punta Arenas the steamer America was burned on her voyage from Panama to San Francisco; the passengers and crew were saved. Other telegraph lines have been opened from this capital to Pachuca, on one side, and Tlalpam on the other. The railway to the latter place has also been finished, and probably will be continued to Cuernavaca. Congress has also voted sums in aid of the telegraph lines from Zacatecas to Durango, and thence to Mazatlan, and to finish the line from this capital to Matamoros, which will place us in magnetic communication with the land of the "Stars and Stripes."

### SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

ND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDIOT BROTHERS,

NO. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

### SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDIOT BROTHERS,

Agents for the American Waltham Watch,

691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1886.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER.

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

Mr. Geo. E. Seibert, Western Union operator, 145 Broadway, New York, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a self-adjuster in every respect."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH OF Dec. 15, 1886.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Agent for the sale of the Nonpareil Relay on the Pacific Coast, Mr. STEPHEN D. FIELD, San Francisco, Cal.

Address all orders to

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them. Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1863. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-300th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package. He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

## "THE LAST SPIKE."

A blow was struck—and the echo was heard  
In vales, and o'er mountains covered with snow :  
The oceans were joined in a lasting embrace,  
(A figure of Metaphor here finds a place)  
And "a kiss was returned for a blow."

—HENRY A. COOPER.

## Decision by the Attorney-General.

A STATE CAN NOT GRANT TO A FOREIGN COMPANY THE  
PRIVILEGE OF LANDING A TELEGRAPH CABLE ON  
OUR SHORES.

WASHINGTON, June 7, 1869.

To PETER COOPER, Esq., President of the N. Y., Newfoundland  
and London Telegraph Company.

SIR: I have considered the question on which you ask my legal opinion, have given it a careful examination, and am now prepared to state the conclusion to which I have arrived. That question is, "Whether, if the New York, Newfoundland and London Telegraph Company should undertake, without authority of Congress—although the State of Maine has given its assent thereto—to lay its lines of cable westerly from the shores of Newfoundland, and to land the same upon the shores of the United States, or to connect its cables with those of any other company chartered by one of the States of the United States, it would, under the Constitution and laws of the United States, have a right to do so?" In the first place, I can have no doubt that any act of concession or charter by any foreign nation can give no rights to a company to exercise any franchise within the territory of the United States. This territory extends, by the law of nations, for the purposes of sovereignty and jurisdiction, to at least the distance of a marine league from its shores. No right, therefore, within the United States could accrue to the New York, Newfoundland and London Telegraph Company in the case you suppose by virtue of the charter granted by British authority. The other branch of your inquiry concerns the distribution of powers between the National Government and the several States of the Union under the Constitution of the United States. By the eighth section of the first article of the Constitution of the United States, it is provided that the Congress shall have "power to regulate commerce with foreign nations and among the several States." By the first clause of the second section of the third article of the Constitution, it is declared that the judicial power of the United States shall extend "to all cases of Admiralty and Maritime jurisdiction." The Admiralty and Maritime jurisdiction thus conferred has always been held to be exclusive in the national tribunals. Martin agt. Hunter, 1 Wheat., p. 337; Slocum agt. Mayberry, 2 Wheat., p. 9; Geiston agt. Hoyt, 3 Wheat., p. 246; Waring agt. Clarke, 5 How., p. 451, 466; Cohen agt. Virginia, 6 Wheat., p. 314. If, therefore, telegraphic communication with foreign countries can properly be held to be included within the power to regulate commerce, or the laying a telegraphic cable upon the shores of the sea between high and low water mark to be a subject of maritime jurisdiction, it must follow that the power of Congress to regulate and control the same is supreme. It was said by Chief-Justice Marshall, in delivering the opinion of the Supreme Court of the United States in Gibbons agt. Ogden (9 Wheat., p. 188) that "commerce undoubtedly is traffic; but it is something more, it is intercourse. It describes the commercial intercourse between nations and parts of nations in all its branches, and is regulated by prescribing rules for carrying on that intercourse;" and, on page 193, that "it has been universally admitted that the words of the Constitution comprehended every species of commercial intercourse between the United States and other nations." The power to regulate includes the power to prohibit in such cases as the public interest may require, as is seen in the case of an em-

bargo. Telegraphic communication is a new means of commercial intercourse which the discoveries of modern science have supplied. Being, however, an instrument of commerce, and a most efficient instrument of commercial intercourse, the fact that it is a new one, does not, in my judgment, prevent the application to it of the Constitutional provision. I am of the opinion that the control of telegraphic communication with foreign nations, so far as it is exercised by means of cables leading from the shores of the United States, is within the constitutional authority of Congress to permit, regulate or prohibit, in such cases and under such circumstances as their judgment shall direct; and that consequently there can be no security for such enterprises while no authority or protection for them has been derived from the acts of Congress. In other words, that the jurisdiction of the United States Government to regulate commerce with foreign nations, including every kind of commercial intercourse, is complete and supreme, that it can be exercised and asserted whenever, and in such manner as Congress shall think fit, and that no action of the Government of any *ex parte* State of the Union can confer any rights upon any person or corporation to carry on intercourse with foreign nations by a telegraphic cable, which will afford any permanent security for the value of their continuous enjoyment, unless the previous assent of Congress has been obtained. The separate States may grant the enjoyment of their own rights of soil and of privileges within their control, but they can not grant rights which interfere with or limit the exercise of the authority of the National Legislature so far as that authority is derived from the Constitution of the United States. Although not yet the subject of judicial determination, this Constitutional power has been repeatedly asserted and exercised by Congress. Thus on the 3d of March, 1857, Congress passed an Act entitled "An Act to expedite telegraphic communication for the use of the Government in its Foreign Intercourse," assuming the right to control this intercourse. On the 5th of May, 1856, Congress passed an Act entitled "An Act to convey communication between the United States and the Island of Cuba, and other West India Islands and the Bahamas," by which the *sole exclusive* privilege was granted to the Ocean Telegraph Company "for a period of 14 years, to construct, land and operate telegraph cables from the shores of Florida," thereby assuming entire control of this subject over the entire Florida coast. On the 24th of July, 1856, Congress passed an Act entitled "An Act to aid in the construction of telegraph lines, and to secure to the Government the use of the same for postal, military and other purposes." By this Act, any Telegraph Company, organized under the laws of any State in the Union, may, upon certain conditions construct lines over any portion of the public domain, or across the navigable streams or waters of the United States; but no authority whatever is granted to connect with cables coming from a foreign country. By the Act of March 30, 1857, Congress granted to the American Cable Telegraph Company of New York the right (after the Company had acquired the necessary land therefor) to lay and operate a cable or cables on the Atlantic coast of the United States ("except the coast of Florida") for the period of 20 years, including the right to lay and operate such cables within any bays, harbors or waters of the United States upon the Atlantic coast, except the coast of Florida. In addition to these instances of legislation, several bills and resolutions have been reported, after the most full and careful discussion, by the Committee on Foreign Relations of the Senate, including some of our eminent lawyers and statesmen, which distinctly recognize the doctrine above set forth. But aside from the question of the power of Congress to regulate commerce, I can have no doubt that the connection of this country with a foreign nation by means of telegraphic cable, is a means of national communication so vital and important, both in peace and in war, to the national interests, and under some circumstances, possibly, even to the national existence, that it is in its own nature, a subject for national control, which it would be impossible for the Government or people of the United States to allow to exist under the separate control of a single State, or to depend upon the arrangements made by one of the States with a foreign power, its citizens or subjects, acting either in a private or corporate capacity. These statements seem to me to contain a sufficient answer to the question which you have submitted.

E. R. HOAR.

## Responsibility of a Telegraph Company.

A suit against the Western Union Telegraph Company, involving an interesting point of law, was argued at Nashville, Tenn., last Friday. The plaintiff had received a proposition for the purchase of goods from parties at Franklin, Ky., which was to be accepted by telegraph at or before a specified time. The telegram accepting the trade was deposited in the telegraph office at Nashville before the specified hour, but was not received at Franklin until after the time. The parties at Franklin declined the trade, whereupon the plaintiff sued the telegraph company for his consequent loss on account of the non-delivery of the telegram. The Judge charged that the fact of the telegram being deposited here by or before the time specified was a completion of the contract, whether it was forwarded or not, and that plaintiff's recourse was upon the parties at Franklin, not upon the telegraph company.—N. Y. Tribune, June 3.

## Annual Rainfall in Different Portions of the Earth.

A correspondent asks us to give the amount of water, rain, hail and snow falling upon an area of 100 square feet, during a year of twelve months, taking the average from one year to another. The form of this question is so indefinite that no satisfactory answer can be made to it. It suggests, however, some remarks in regard to the subject which may not prove uninteresting to our readers at large, and which will probably contain the information desired by our correspondent.

There are great variations in the quantities of water precipitated upon equal areas situated on different parts of the earth's surface. In some places scarcely a day passes without rain, others exist where rain scarcely ever falls. Striking a mean of all the water precipitated in any form over zones of moderate width, parallel to the equator, it will be found that the fall diminishes from the equator toward the poles. The fact is easily explained by the general principles of rainfall, which may be thus stated: Rain, hail and snow are water frozen or otherwise precipitated from the atmosphere. The amount that can fall at any locality depends, principally, of course, upon the amount of water contained over that locality. There are certain places where local influences prevail to such an extent, that the latter proposition does not apply to them, but they are exceptions to a general law, which do not affect the truth of the statement. The amount of water contained in a given amount of air is, all other things being equal, proportioned to its temperature. The hotter it is the more water it will contain, and *vice versa*. As the average temperature of the atmosphere decreases from the equator toward the poles, its capacity for moisture also decreases; hence the inference that less rain would fall in high latitudes than in lower is perfectly legitimate. It has, moreover, been confirmed by observation.

At London the fall is 25 inches; at Bordeaux it is

25.8; at Madeira it is 27.7; at Havana it is 91.2; at St. Domingo, 107.6. It has been estimated that in the northern part of the United States the average number of rainy days in each year is about 134, in the southern part is about 103. The lesser number of rainy days in warmer climates is more than counterbalanced by the amount of water which falls in a given time, the tropical rain storms being proverbially very heavy. Prof. Silliman gives the following estimate of the mean annual number of rainy days for different latitudes:

N. Latitude.	No. Rainy Days.
From 12° to 43° . . . . .	78
" 43° to 46° . . . . .	103
" 46° to 50° . . . . .	134
" 50° to 60° . . . . .	161

He also estimates the amount of rain at special points as follows:

"The greatest annual depth of rain occurs at San Luis Maranham, 280 inches; the next in order are Vera Cruz, 278; Grenada, 126; Cape Francois, 120; Calcutta, 81; Rome, 39; London, 25; Uttenberg, 12.5. The rainfall in New Hampshire is about 38 inches; in New York State, 36; Ohio, 42; Missouri, 38.26. The average for the United States is about 39.23. In the torrid zone the mean fall is 95 inches. In the temperate zones it is 35 inches. The mean fall for the two temperate zones and the torrid zone is 55 inches. An inch of water upon a square foot of surface will weigh about five and one-fifth pounds; on one hundred square feet it would be 520 pounds; which, multiplied by the mean depth of fall over the surface of the torrid and two temperate zones, 55 inches, gives 14.3 tons. In round numbers the mean amount of rain falling upon each acre of these zones is 5,500 tons.—*Scientific American*.

#### On Some Applications of Electricity to Naval and Military Purposes.

BY F. A. ABEL, F.R.S., FOR. SEC. C.S.

(From Chemical News.)

(Continued from page 148.)

A class of electrical instruments has been created within the last three years which bids fair to supplant even these very powerful and efficient frictional machines. The instruments in question, of which different forms have been devised by Wheatstone, Wilde, Siemens and Ladd, have received the generic name of *dynamo-electric machines*, because dynamic force becomes through their agency a direct and powerful source of electricity. In the machines of Siemens, Wheatstone and Ladd, mechanical power is transformed into electric force without the intervention of permanent magnets. The action of the most simple form of these instruments may be described as follows: The residual magnetism existing in an electro-magnet suffices to develop an induced current in a rapidly revolving coil armature; this current, reacting upon the electro-magnet, determines the development of powerful magnetism in the latter by the inductive action of its insulated coils; the currents developed by the electro-magnet are consequently in their turn greatly increased in power, and react again upon the armature; and thus an immense accumulation of electric force is accomplished with great rapidity until, when that accumulation has reached the maximum attainable without detriment to the insulation of the wire coils, a simple interrupting arrangement causes the current to be diverted from the machine to conducting wires, by whose medium it is utilized. The details of the machines vary according to the different plans adopted by the several construc-

tors, but the above explanation applies more particularly to the machines of Messrs. Siemens and Halske, who have been the first to produce a small instrument of this class thoroughly applicable to mining purposes, and which almost equals in power the ebonite frictional electric machine. Fifty charges, arranged in simple circuit, have been repeatedly exploded, without any failures, by one of these machines; it therefore provides with certainty the power necessary for the most extensive mining or submarine operations, and is at the same time quite free from all disturbing atmospheric influences. Its mechanism is simple, and less easily susceptible of derangement than that of any magneto-electric apparatus, and as it is independent of everything but the application of manual power for the development of its action, it is far superior to the most perfect of these, independently of the fact that it surpasses them all greatly in power. For many important military and mining operations the hand dynamo-electric machines, constructed by Messrs. Siemens and Halske, are therefore unquestionably superior to all other existing apparatus which furnish electricity of tension. This class of instrument, however, shares, to some extent at any rate, one important defect of the frictional-electric machines, which is consequent upon the powerful charges of high tension electricity sent into conducting wires by their agency. It was observed, in the earlier experiments of the Austrians with frictional electricity, that if two or more insulated wires which led to distinct mines were situated side by side, in moderately close proximity, even only for comparatively short distances, the charge sent from the machine into one of the wires, with the view of only exploding a particular mine or series, might develop in neighboring wires, not connected with the machine, a charge of induced electricity of sufficient power to explode the mines connected with those wires. Some results obtained at Chatham, and many experiments recently instituted at Woolwich, have not only confirmed those observations in Austria, but have shown that means do not at present exist of avoiding this serious defect of powerful charges of high tension. If, therefore, it is necessary to lead separate wires from the point of operation (from the exploding instrument) to different mines or groups which it is desired to explode independently of each other, it is impossible to employ the frictional electric machine as the exploding agent without great risk of failure, even though the wires, laid upon or imbedded in earth, are separated as widely as possible, as they must unavoidably extend in proximity to each other to a distance from their points of union with the machine, which, if the latter be highly charged, may prove sufficient to determine the development of induced "exploding" currents in the wires leading to mines not intended to be fired. If the wires lead to submarine mines or torpedoes, and are therefore submerged, the unintentional explosion of mines becomes much more certain, and the frictional machine is consequently inapplicable to submarine operations in all instances where mines are arranged in separate circuits. The dynamo-electric machines share this serious defect to some extent; still, with proper experience in their use, they are not altogether inapplicable to such services as above specified. If Siemens' dynamo-electric machine be highly charged by very rapid revolutions of the armature, the inductive action of the charge will be similar in power to that exerted by the charge of the frictional machine, but, by revolving the armatures slowly, it is possible to charge the machine sufficiently to fire a mine or a small group with certainty, while the inductive action of the charge sent into the wire will not influence neighboring wires to an extent sufficient to cause the explosion of mines connected with them.

The subject of the application of electricity to the

explosion of submarine mines for purposes of defence and attack received some attention from the Russians during the Crimean war, and was practically developed in its most simple form in 1859, in the hands of the Austrian government, when a system of submarine mines, to be fired through the agency of electricity by operators on shore, was applied by Baron von Ebner to the defense of Venice, which, however, never came into practical operation. The subject of the utilization of electricity for purposes of defense did not, however, receive serious consideration in England or other countries until some years afterwards, when the great importance of submarine mines as engines of war was demonstrated by the number of ships destroyed and injured during the war in America. Twenty-five vessels belonging to the Federal navy were destroyed and nine others injured by the explosion of torpedoes, while the Confederates lost three vessels by accidentally coming into collision with their own torpedoes, and one which was attacked by means of a torpedo and destroyed by the Federals.

Soon after the commencement of that war the attention of the English government was called to the importance of practical inquiry into the value of submarine obstructions, both passive and active, as auxiliary agents of defense, and a committee was appointed at the suggestion of Colonel Jervois, C.B., R.E., to report on the use which might be made of floating or sunken obstructions and of submarine mines, in the defense of channels, harbors and rivers. The labors of this committee have recently terminated, and they were enabled, by the aid of systematic investigations conducted for them at Woolwich during the last four years by one of their members, Mr. Abel, and of practical experiments carried on chiefly at Chatham under the direction of another of their body, Colonel A. a'C. Fisher, C.B., R.E., to elaborate the subject of the application of electricity to submarine mines and torpedoes, to such an extent that a solid foundation of information and instruction is now available for those who may at any time have to be entrusted with the actual arrangement and employment of these important means of defense. Continental governments have also devoted much attention to this subject, and especially the Austrian government, for whom Baron von Ebner devised an ingenious and elaborate system of electric torpedo defense, exhibited in detail at the Paris Exhibition of 1867, which received application during the recent war, though its efficiency was not actually put to the test except in the way of experiment.

The application of electricity to the explosion of torpedoes was very limited during the American war; but arrangements for the extensive employment of that agent as the exploding power were far advanced in the hands of both the Federals and Confederates at the close of that war. It appears that only in two instances of the entire number of vessels destroyed and injured was the explosion of the torpedoes effected by electric arrangements, the others having all been exploded by mechanical agency.

The explosion of submerged charges of gunpowder by mechanical contrivances, either of a self-acting nature or to be set into action at desired periods, was accomplished as far back as 1583, during the siege of Antwerp by the Duke of Parma. The English employed self-acting torpedoes against the French ships off Rochelle, in 1628, and from that period to 1854 devices of more or less ingenious and practicable character have been proposed from time to time, and even applied to some small extent in different countries for the explosion of torpedoes either by clock-work at fixed periods, or by coming into collision with a ship. The Russians were the first to apply self-acting mechanical torpedoes with any prospect of success.

and there is little doubt that had the machines which were applied to the defense of the Baltic been of larger size (they only contained 8 or 9 lbs. of gunpowder), their presence would have proved very disastrous to some of the English ships which came into collision with and exploded them. Various mechanical devices for effecting the explosion of torpedoes by their collision with a ship were employed by the Americans during the recent war, a few of which proved effective. But although, in point of simplicity and cost, a system of defense by means of mechanical torpedoes possesses decided advantages over any extensive arrangements for exploding submarine mines by electric agency, their employment is attended by such considerable risk of accident to those at whose hands they receive application that, under many circumstances which are likely to occur, they become almost as great a source of danger to friend as to foe. Thus the operations of lowering and mooring torpedoes, the explosion of which depends upon the application of a blow, thrust, or pull to some portion of the machine, which is so placed and arranged as to be in a favorable position for the application of mechanical action by a passing ship, are attended with very great danger to those employed, unless some means are adopted for rendering the exploding mechanism inactive until after the torpedo has been placed in position. But the employment of a safeguard of this kind involves a considerable amount of uncertainty as to the torpedo being rendered active, by its removal after the operation of mooring is completed, because this very removal is frequently a dangerous operation. Again, when once the mechanical torpedoes have been placed in position and rendered active, they are as dangerous to friendly ships as to the enemy; consequently their employment for the defense of a particular tract of water completely closes it until the torpedoes have been exploded or removed, and their removal obviously constitutes one of the most dangerous services upon which men can be employed. Several instances have recently occurred in America of the destruction of ships in waters defended during the war by mechanical torpedoes, of which it was believed that the subsequent removal had been completely accomplished. Some improvements have recently been made in mechanical and chemical appliances of a self-acting nature for torpedoes by the employment of which the mooring arrangements can be completed with perfect safety, and the torpedoes afterwards rendered active, by the performance of a simple and safe operation when it is desired to close the defended water. But the complete exclusion of friendly vessels, and the difficulties attending the raising of the torpedoes when no longer required, still constitute formidable objections against the use of mechanical torpedoes, excepting in the case of tracts of water which are not ordinarily navigated, but the passage of which in times of war might be attempted by vessels of light draft.

The most important advantages secured by the application of electricity as the exploding agent of submarine mines and torpedoes are as follows: They may be placed in position with absolute safety to the operators; they may be rendered active or passive at any moment from the shore; the waters which they are employed to defend are therefore never closed to friendly vessels until immediately before the approach of an enemy; they can be fixed at any depth beneath the surface (while mechanical torpedoes must be situated directly or nearly in the path of a passing ship), a circumstance which very considerably simplifies the arrangements for their application in tidal waters; lastly, electric torpedoes may, when no longer required, be removed with as much safety as attended their application.

(To be Continued).

### The Great Induction Coil.

One of the greatest scientific wonders, even in this wonder-producing age, is unquestionably the great induction coil—or inductorium, as the German physicists term it—at the Polytechnic Institution. It is an instrument of remarkable power and capacity, and possesses the highest scientific interest. In designing this induction coil, which is about six times as large as any previous production of the kind, Professor Pepper's object was to obtain an easily controlled source of electricity, combined with a degree of tension sufficient for the scenic requirements of the Polytechnic. In carrying out this object, the Professor enlisted the services of Mr. Apps, of the Strand, who has himself effected many important improvements in induction apparatus, and to whom is due the construction of the present powerful machine; but, although so extremely powerful, it is nevertheless perfectly safe to the manipulator, so carefully has every contingency of accident been guarded against. The machine consists of an ebonite barrel, 9 feet 10 inches in length, supported at each end on two ebonite pillars. The barrel was made at the Silvertown Works, and is the largest ever turned out there. It contains the compound coil, and of itself weighs 477 pounds, the whole machine weighing 15 cwt.

The primary wire is of copper of the highest conductivity, 0.0925 inches diameter (B.W.G., No. 13), and 3,770 yards in length; the number of revolutions of the primary wire round the soft iron core is 6,000, its arrangement being three, six and twelve strands. The total resistance of the primary coil is 2.201400 British Association units; and the resistances of the primary conductors are respectively for the three strands, 0.733800; for the six, 0.366945; for the twelve, 0.1834727 B. A. units. The soft iron core is composed of straight wires of very soft iron, each wire being five feet in length, and 0.0625 inches in diameter. The diameter of the bundle of core wires is four inches, and their weight 423 pounds. The secondary wire is 150 miles in length, 0.015 inches (B.W.G., No. 29), diameter, and is covered with silk. The total weight of the wire is 606 pounds, and its electrical resistance 33,560 B. A. units. This secondary coil is four feet two inches long, and the insulation is calculated for safety at 95 per cent. beyond absolute requirement. The secondary wire is insulated from the primary by an ebonite tube eight feet in length, and one-half inch in thickness. The condenser is made with sheets of varnished paper and tinfoil, arranged in six parts, each containing 125 feet super, or a total of 750 feet super.

The machine was originally tried with a contact breaker detached from the great coil, and having an independent electro-magnet; up to ten Bunsen cells with the great inductorium, this worked well, but when the battery was increased to thirty or forty cells, it became unmanageable. A Ruhmkorff break, with platinum amalgam and alcohol above it was substituted, which saved the points, but the spirit was now and then violently ejected and set on fire. Professor Pepper then proposed a modification which has proved successful, remaining in perfect working order during a series of experiments extending over eight hours. The commutator regulating the admission of the battery current is provided with a locking apparatus, and the whole coil is most carefully and effectually insulated from the floor and surrounding apparatus, as are also the separate portions of the apparatus from each other. The battery power is at present supplied by forty Bunsen cells, each containing a pint of nitric acid. It is, however, intended to substitute for this, a Grove's battery of the largest size ever made, and which is in course of construction. It will consist of pipe-clay cells, 2 feet square upon the sides, and four inches wide, with walls one-eighth of an inch thick.

In working the great induction coil, the sparks obtained from it with five Bunsen cells are twelve inches in length; ten cells give sparks fourteen inches in length; fifteen cells give seventeen and a half inch sparks; twenty cells give twenty-one inch sparks; twenty-five cells give twenty-three inch sparks; thirty cells give twenty-three and a half inch sparks; thirty-five cells give twenty-six inch sparks; forty cells give twenty-seven and a half inch sparks; and with fifty cells, sparks from twenty-eight inches to twenty-nine inches in length were obtained. After eight hours working, the coil gave, with fifty cells, a spark twenty-five and a half inches in length. It was also found that of the proportions of the condenser used, one-half gave the longest spark. The spark is not such as is generally produced under similar circumstances, but is a thick wire of light, surrounded by a wide waving flame two inches or three inches thick, and which can be blown aside from the spark. The spectroscopist gives a perfectly continuous spectrum, like the light of day, only that it is barred with the bright lines of the substances in combustion. The flame of the spark, with a very slight blast of air, rises to at least twelve inches in height when it is passing about the same distance horizontally.

Beside the gigantic Grove's battery, there is also a Leyden battery in course of construction, the present one being inadequate to represent the full power of the coil. The first part of this battery, consisting of 250 feet super of coated glass, is now nearly completed. There is also a very large and elegant arrangement of Gassiot's cascade in course of construction, which is also to work with the great induction machine, and which will embody several important improvements that have been suggested by Mr. Gassiot. The most recent experiments with the coil have shown that as yet no limit as to the quantity effects can be established, and it is exceedingly probable that by a very few minutes' working, the large coil would charge at least 1,000 Leyden jars of very large size. The coil, too, is probably destined to throw a new light upon scientific research, and to solve the problem—what is ozone? In reference to the amount of this element, and the density at which it may be produced, very few experiments have as yet been made. But enough is seen in the extraordinary reddening effect of the flame of the spark on litmus paper, to show that we are likely very soon to solve the ozone problem.—*Mechanics' Magazine*.

### Banquet to Professor Morse in New Jersey.

The residence of Mr. N. D. C. Moller, at Summit, N. J., formerly the property of Chancellor Kent, was the scene last evening of a very pleasant affair, in the form of a banquet tendered to the illustrious Professor Morse, of electric telegraph fame, by Mr. Moller. Among the other distinguished guests present were Governor Randolph, ex-Congressman Coleman, F. S. Lathrop, Austrian Vice-Consul Bolewski and Mr. E. N. Fuller. There were also present many ladies.—*Evening Telegram, May 21st*.

### Telegraphs in China.

"Memorandum of 29 articles which it has been decided to add to the treaties between China and foreign nations; final decision on three of them (Nos. 14, 15 and 21) is reserved until the return of the Ambassadors:—

"15 (Undetermined). It is proposed that foreigners shall be allowed to construct railways and telegraphs in the 11 provinces and in Tibet. As these works are eminently calculated to further commercial and military operations, not only shall Chinese offer no obstruction, but they shall give every assistance in their power."

### The Simultaneous Transmission of Messages over a Single Wire in opposite Directions.

CONTRIBUTED BY G. B. PRESOTT, ESQ.

[From the London Telegraphic Journal, May 14, 1864.]

The transmission of messages over a single wire in opposite directions at the same instant, had occupied the attention of the scientific, both in Europe and America; and the problem has been solved, in as many different ways, by no less than five individuals. The following drawing illustrates the method devised by Dr. Gintl, of Germany, which seems to be very simple, and proves, upon trial, to work with entire success.

The apparatus used is that of Professor Morse. The arrangement of the circuit is that technically known as the open circuit.

Let me premise that in transmitting a dispatch by this system, the electro-magnet of the transmitting station does not work—only that of the receiving station is operated by the current. When the key, or transmitter, is at rest, a spring closes the connecting point at the back end, and when it is pressed down by the operator in transmitting a message, the back connection is broken, and the front one established.

I have represented a section of line between London and Liverpool. *A, A'*, are two rheostats in the offices of London and Liverpool, which represent, each of them, the exact resistance of the line wire between these two points. *B, B'*, are electro-magnets of peculiar construction, being so arranged that a current may traverse either half or the whole of the coils, or may traverse one coil in one direction, and the other coil in the opposite direction. *C, C'*, are the batteries, *x, x'*, the keys; and *P, P'*, the ground plates.

Let us now suppose that London wishes to send to Liverpool. The operator at London presses down his key, and the current from the battery, *C*, passes through the key to the main wire, and thence down the branch wire, *D*, through the key *x'*, to magnet *B'*, thence through the ground plates, *P'* and *P*, to the magnet *B*, and thus back to its starting point in the battery at *C*. When the current passes through the coil, *B'*, at Liverpool, it operates the apparatus there in the usual manner. But I have not described the entire course of the current. When it reached the junction, *D*, one half of it passed through the rheostat, *A*, through the upper half of the magnet *B*, and thence to its starting point at the battery. It will thus be seen that one-half of the current having passed in one direction through one of the coils, *B*, and the other half in the opposite direction through the other coil, *B'*, that its effect is neutralized, and that no action takes place in the magnet at the transmitting station.

Now let us suppose that London and Liverpool both press their keys down at the same moment, each sending to the other. The current from the batteries, *C* and *C'*, would meet at the junction *D* and *D'*, and neutralize each other, and, consequently, no current would pass over the wire. It would, in fact, be the same as if the wire were actually broken between these points during the time that both keys were pressed down. Under these circumstances the current from the battery, *C*, returns through the rheostat, *A*, through one half of the coil *B*, and thence back to the battery *C*. What takes place at London, of course occurs at Liverpool under the same conditions. Thus

the writing upon the London and Liverpool instruments is actually performed by their own respective batteries, but as this record depends upon the closing of the key at the distant station, it amounts to the same as if done by the battery of the other.

Having now shown how the record is made while the receiving station has his key in its ordinary position of rest, as well as where it is pressed down in the act of transmitting, let us now consider what will be the course of the current when it is in neither of these positions, that is to say, when the back connection has been broken by pressing the lever to make a letter, but before the front contact has been established. We will consider that Liverpool's key is in this position, and that London is writing. In this case the current, on arriving at *D*, does not pass down the branch wire, as there is no outlet for it, but passes on through the rheostat, *A'*, thence through both coils *B'*, to the ground plate *P'*. The current in this case passes not only along the line between London and Liverpool, but also encounters a resistance at *A'*, of equal extent; but this is equalized by passing through both coils of the electro-magnet, *B'*, so that the adjustment of the instrument remains the same throughout.

If this apparatus has not been generally used, it does not arise from its inutility. With a line well constructed and properly insulated, there would be no difficulty in working it. It could not be relied upon where there is heavy escape, and to have entire success the resistance coils should exactly equal the resistance of the line wire, and the magnets be well constructed.

### Signals.

F. N. Gisborne, who has for years past made himself conspicuous by his signals for use on board ship, in mines, factories or dwelling houses, has now brought out a method which, for simplicity and efficiency, excels all his previous inventions. First, he used galvano-electricity, then pneumatic tubes, and compressible air-chambers, both costly and liable to derangement. Now, with a balance-weight and a chain, he accomplishes all he desires with his system of signals. A captain standing on the bridge of a steamer can, by touching the indicator, send an order to the steersman or the engineer, and see at once whether they obey, without changing his position. And that which can be done in a ship can be done in a house, workshop, or mine, and by a simple mechanical arrangement, which can hardly fail to be received with favor. It has been already adopted in the five leading navies of Europe; and the great Prussia iron clad, *König Wilhelm*, now building on the Thames, is fitted with a set of Gisborne's signals, finished in a style which may truly be described as royal.

A magneto-exploder, constructed by Breguet of Paris was shown, which will fire a fuse, and consequently a cannon, at any distance from two feet up to two hundred miles.

Clerk Maxwell exhibited a "Wheel of Life," containing what he calls dynamical diagrams, and these, when the wheel is set agoing, produce many remarkable phenomena of curves and their intersections. Thus, in the hands of a philosopher a toy becomes a means of illustrating the laws of curvilinear motion. Teachers of geometry and natural philosophy would find it useful.

N. J. Holmes, who is among the foremost of English telegraphists, exhibited his new magneto-alphabetical telegraph, which is one of the cheapest, if not the cheapest and simplest yet constructed. It comprises two circles of buttons, and the operator has only to touch button after button, and spell out his message as rapidly as he pleases. With this and other instruments before them, government will have a sufficient variety to choose from when they assume control of the telegraphs.

### Testing the Continuity.

Among our Chicago items is the following rather suspicious one. Who are these worthy cable layers? Does any body know?

"Among the many parties of visitors from other points in the West was one body of good looking young men, who appeared to be deeply interested in telegraphy, in the first place, and to have participated in the Atlantic cable celebration, in the second. For a long time they remained on a street corner, near the court house, earnestly discussing the question of land and marine telegraphy, and waiting patiently in the meantime for something—Macawber like—to 'turn up.' As a final resort, the entire crowd adjourned to a 'convenient' saloon, and possessing themselves of a few feet of rope, the enterprising young men instituted a series of very pleasing and instructive experiments. They would first stretch a few feet of the rope from chair to chair, as if in the act of laying a telegraph wire; and then would unanimously adjourn to the bar, for the purpose of 'testing the continuity' of the current. A little more rope would be laid down, when it would again become necessary to 'test the continuity.' This highly edifying line of conduct was continued for some time, when all the 'wire' having been satisfactorily adjusted, the amateur operators confined their entire attention to the question of the 'continuity.' At last accounts the 'testing' was being prosecuted with unabated zeal, and with no probable prospect of a speedy termination, inasmuch as the gentlemen engaged in the labor were individually, collectively and unanimously expressing the determination that 'We hic w-hic-out g'home till mor-hic-ing.'"

### Telegraph Wires in the Tunnel.

The Western Union Telegraph Company is still continuing the work of improvement in their telegraphic lines leading in and out of the city. The latest improvement proposed is in the wires running westward, and which cross the river to and through the West division. These wires, which formerly ran through the water mains, now run through the tunnel. Over the ventilator, at either end of the river tunnel, a neat tower has been built. The new poles of the company are extended close up to the river bank, and the wires are stretched from them into the top of the tower, where they are fastened to cross arms by insulators, and thence pass down the centre of the tower through the ventilator, and then, turning an angle, are again fastened by a new patent insulator to an iron framework erected by the company, thence along the top of either arch of the roadway, up the ventilator tower shaft, and out to the poles on the West side. Between the arches at the large head lamp of the roadway, an iron frame is constructed, to which the wires will in future be fastened. The wires running through here are at present less numerous than they will be. It is expected that seventy-two wires will be run through the tunnel when everything is completed.—*Chicago Times*.

ALL terrestrial power is drawn from the sun. He is the real magician upon earth. He keeps the sea liquid and the atmosphere a gas, and all the storms which agitate both are blown by the mechanical force of the sun. Thunder and lightning and the *aurora borealis* are his transmuted strength. His energy is poured freely into space, and our world is but a halting place where this energy is conditioned. Here the Proteus works his spells—between his entrance and departure the multifarious powers of our globe appear; they are the moulds into which his strength is temporarily poured in passing from its source through infinitude.

### Telegraph Base Ball Clubs.

An interesting game of base ball took place on Saturday the 5th instant, at Hamilton, Ohio. The contesting clubs on the occasion being the Night Owls of the Western Union Telegraph office, Cincinnati, and the Resolutes of the former city. Owing to the heavy rains the night previous the grounds were in bad condition for good fielding.

At 1 P. M. the innings having been tossed for and won by the Night Owls, Finlay opened play for the Resolutes by a hot grounder to Spink, which was beautifully stopped but poorly thrown to first, thus giving the striker a life. He and the next two strikers tallied, when Campbell and Laurie were disposed of on tip bounds by Neil, and Boli thrown out at first by E. Baker. Gould was first to the bat on behalf of the Night Owls, but was disposed of at first by Hamill and Moore. Spink, E. Baker and Neil tallied, when Kern and Newton (of "O K" slippers fame) were put out at first by Hamill and Finlay. Score 4 to 3. In the second innings Kern, by two difficult fly catches, disposed of Milliken and Boli, and Potter was captured on foul fly by Spink after the Resolutes had scored seven runs. The Owls in this inning scored five tallies, the outs being Gould on the fly to Laurie, Neil on a tip bound, and Newton at first by Finlay. Score 10 to 8. Game close and exciting. In the next inning by good batting, assisted by some wild throwing, the Resolutes were enabled to pile up nine runs, ere Moore was disposed of on foul bound by Spink, and Milliken and Hamill by flies well taken by E. Baker and Scott. The Owls in this inning could only secure one run, Spink and Neil suffering on first base at the hands of Dick, Imlay and Moore, and Webb being beautifully caught out on the run by Laurie in centre field. One run also was all the Resolutes could obtain in the fourth inning Laurie and Boli being disposed of at first by E. Baker, and Scott and Potter on a foul bound to Neil. One run was all also the Night Owls could get owing to W. Baker's striking out, Newton's being thrown out at first by Milliken, and Webb's being put out while trying to steal home. In the fifth inning, after Boli had been disposed of at second by Spink, and Hamill had been flied by E. Baker, the Resolutes secured five tallies, when Moore tipped out to Neil. In this inning the Owls reached home plate three times, the outs being Neil and Kern on flies to Imlay and Dick, and W. Baker who again struck out. In the sixth inning Potter tipped out, Hamill was disposed of at first by Spink and Scott, and Finlay died on the same base by a beautiful pick up and throw of Kerns, the consequence being a white-wash for the Resolutes, who tried hard to return the compliment but Newton reached home ere Webb was flied by Imlay, Gould and E. Baker being put out at first by Imlay and Moore, leaving the totals 25 to 15 in favor of the Resolutes. The popular superintendent of the district umpired the game admirably, and was greeted with three rousing cheers at the finish. Too much praise cannot be given the Hamilton boys for their gentlemanly treatment of the Owls, an elegant lunch being one of the features of the day. Appended is the score :

RESOLUTES.	O.	R.	NIGHT OWLS.	O.	R.

VOYAGEUR.

### Death of C. J. Gaines, of Richmond, Va.

RICHMOND, Va., May 30, 1868.

D. R. DOWNER, Esq., Secretary Telegraphers' Mutual Life Insurance Company, New York.

DEAR SIR: It is my painful duty to announce to you the death of Mr. C. J. Gaines, a clerk in this office and a member of the "Mutual," which occurred at his residence in this city at 9 o'clock A. M., on the 28th instant, after a protracted and severe illness of six weeks' duration, in the 35th year of his age.

Prompt and earnest in the discharge of every duty, and provident for the care of those dependent on him, he was one of the first in this section to avail himself of the benefits of the "Mutual," and while at each recurring death in the institution he mourned the loss of the good and true of our profession, yet he was ever ready to respond at once to the call thus made upon him for the relief of those left without a human helper. It is thus made both the privilege and the duty of those of us who survive him, and who so deeply lament his demise in the full flush of manhood, to respond with equal readiness and alacrity to the claims of his bereaved ones.

I therefore hope you will inform me at your earliest convenience what forms (if any) are necessary to secure his insurance for the widow. She is left very poor, without the means even to meet the expenses of his burial. Very respectfully, &c.,

R. M. J. PAYNTER,  
Manager.

P. S.—In anticipation of the call you will make upon the members, I enclose you one dollar from each of the members named below:

J. R. Dowell,	E. McCarthy,
Joe. McGovern,	Geo. McGovern,
Wm. S. Taylor,	Geo. B. Gaines,
G. R. Pace,	R. M. J. Paynter.

### Monopoly vs. Monopoly.

Mr. Dunn, of Philadelphia, offered the following resolution at a meeting of the National Typographical Convention:

WHEREAS, The Associated Press has virtually decreed that no more newspapers shall be published in the United States, and that those in existence who do not obtain their news through the Associated Press shall be suppressed, thereby lessening the demand for our labor; therefore,

Be it Resolved, That we, the delegates to the Seventeenth session of the National Typographical Union, held at Albany, N. Y., June 7, 1869, representing — States and — Unions, do earnestly ask the Congress of the United States, should the postal telegraph bill come up for action at their next session, that they give it their favorable consideration, thereby increasing the demand for our labor, equalizing the business interests of the country and destroying one of the worst monopolies in existence.

Mr. Troup denounced the Associated Press as the greatest and worst monopoly in the country; and this monopoly was not alone injurious to the printer but injurious to every workingman. He wanted these resolutions adopted, and he with others would carry them before the entire workmen of the country and break down this gigantic monopoly. They would go to the Congress of the United States and demand a relief from this great monopoly.

Mr. Corcoran, of Troy, asked if the Associated Press could not bring the same charge against this Union? Are we not ourselves great monopolists, working for our own interests?

Mr. Troup said that this Union did not prohibit any honorable man from coming into it.

Mr. Corcoran.—Does the Associated Press prohibit any honorable man from joining it?

Mr. Troup.—Yes, sir. Mr. Charles A. Dana and others proposed to start a cheap two cent paper in New York, but they were denied admission to the

Associated Press and were obliged to buy the *Sun*, already in the Association, and pay for it \$100,000.

Mr. George, having the chair, said he agreed with all that had been said against the Associated Press, but he doubted the wisdom of endorsing the postal telegraph proposition, which had engaged the attention of the wisest men in the country for years and failed to secure their approval.

Mr. Troup said he would have no objection to refer the matter to a special committee.

Mr. Getchel moved its reference to a committee of five. Carried.

Mr. Corcoran is a sensible man. He put a pin in a bladder and it was no more. To some men every thing is a monopoly which they can not control. Even in religious matters some men are Episcopalians because, as the sailor said, "There is a chance to jaw back." The idea of a postal telegraph helping the Typographical Union is very spiritual, a decidedly elevated idea. The buying of the *Sun* was a ten strike for Mr. Dana, and the payment of \$100,000 does not prevent that paper making money at two cents.

### Scintillations from Scientific Authors.

BY MADISON BUELL.

Lava has been known to flow over a layer of ashes, underneath which was a bed of ice. The non-conductivity of the ashes saved the ice.

The heat emitted from the sun in a year is equal to that which would be produced by the combustion of a layer of coal seventeen miles in thickness!

Every force upon earth, electricity, magnetism, light, heat, &c., is definitely and equivalently convertible into each other, and where experiment does not give a full equivalent, it is because the initial force has been dissipated, *not lost*, by conversion into other unrecognized forces.

Electricity is that affection of matter or mode of force which most distinctly and beautifully relates other modes of force, and exhibits, to a great extent in a quantitative form, its own relation with them and their reciprocal relations with it and each other.

M. Arago was the first to observe that a wire, when traversed by a powerful current, and plunged into iron filings, retained around it a considerable quantity, which formed a cylindrical mass of the thickness of a quill.

Magnets, whose coils are long, discharge their magnetism much less easily and slowly than those whose coils are short.

The good conductor of heat is the good conductor of electricity, and the bad conductor of heat is the bad conductor of electricity.

Molecular motion can travel with equal and even greater velocity than light, and is shown by the rapidity with which electricity traverses a metal wire where each particle of metal is undoubtedly affected.

It has been observed that wires which have for a long time transmitted electricity, have their texture changed and are rendered brittle. In this observation, however, though made by a skillful electrician, M. Peltier, the effects of exposure to the atmosphere, to changes of temperature, &c., have not been sufficiently eliminated to render it worthy of entire confidence.

Any force arbitrarily selected can mediate or immediately produce and be merged into the others.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JUNE 15, 1869.

### Telegraph Statement and Dividend.

The Western Union Telegraph Company have declared a dividend of two per cent. from the earnings of the six months ending May 1, payable on and after July 20th. The transfer books close June 21. The dividend is at the rate of ten per cent. per annum on the present market value of the stock. The actual earnings during the year have exceeded six per cent., over two per cent. of which has been used to reduce indebtedness, and extend the company's lines. During the past six months the indebtedness has been reduced \$150,000, and during 1868 5,000 miles of wire have been added to the company's property.

Some, no doubt, in looking over the statement of business which will be found elsewhere, will express disappointment that the advance in receipts is no greater than appears. It should be a cause of increased confidence that, notwithstanding the large reduction on many of the most important tariffs, the receipts exceed those of the previous year. The general commercial business of 1867-8 was unusually active and vigorous. It illustrated its vigor in a large and free use of the telegraph. The telegraph is the barometer of the national industry. The past year has not been marked with the same animation. It has been a year free from speculation or excitement. It has been a year of careful husbandry of the fruits of former successes, yet of fair, healthy, careful enterprise. The use of the telegraph has been in correspondence with this state of industrial care and health. Yet its sphere has been greatly enlarged. Five thousand miles of wire have connected hundreds of new offices, and added conveniences to the old. The reduction of many important tariffs has led to wider and more liberal employment of its wires. The Company stands to-day stronger, better in hand, in closer correspondence with public sentiment, in healthier fulfillment of its public trust, in well and broad based prosperity than ever. The simple instincts of self-interest, the truest and most powerful motive which governs enterprise, even admitting the soullessness of corporate bodies, is steadily adapting this vast web of wires to the multifarious necessities of the nation on principles of justice and liberality.

It is asked, "why do the expenses of the year show an increase proportionally greater than that of the receipts?" The causes are various. In the opening of new lines to reach new communities, the receipts increase only with the education of the people to the use of the telegraph. At the first, in newly opened regions, expenses almost always preponderate. Some of the most productive offices a few years ago scarcely paid expenses. These new and distant communities must be reached even at an initial loss. The character of the whole enterprise demands this as an act of good faith to society. In this policy the Company is fixed and united. Its triumph is in the widest offer of its wires to all communities. The telegraph does not precede civilization, but it must attend it, for it is, in itself, one of its most potent agents. The money thus spent returns in time four-fold. Thus enterprise and liberality shake hands with self-interest and success.

During the last half year, also, a large share of the usual outlay assigned to the Fall months has been consumed in an energetic renewal of large stretches of imperfect line, preparatory to the Fall business, which it is proposed to

have done easier, better, more promptly than ever. Everywhere has work been prosecuted with reference to this determination. The skill of the General Superintendents has been backed by the energy of the executive, and never have telegraph lines entered the Summer solstice with equal capacity for enlarged and liberal use of their wires.

The telegraphic property in the United States January 1, 1869, as compiled from the most authentic sources, was as follows:

MILES OF LINE.	
Western Union Telegraph Company.....	50,760
Lines working in connection therewith.....	6,417
Other lines.....	6,773

MILES OF WIRE.	
Western Union Telegraph Company.....	97,216
Lines working in connection therewith.....	8,077
Other lines.....	9,100
Skilled persons in the employ of the Western Union Telegraph Company.....	6,389
Offices.....	3,331

There is every indication of a growing confidence in the stability of the Western Union Telegraph Company and a clearer perception of its policy. Its stock is finding its way into the hands of men who appreciate its value, and whose influence is a guarantee of stability and success.

### Induction.

A critic who signs himself "Induction," but whose identity, by no process of induction known to us are we able to recognize, undertakes to expose the fallacy of Mr. Prescott's recent article on the working of wires during auroral or magnetic storms. It is very important that a critic should clearly perceive the subject of his criticism, lest he be found discussing a case which has not been presented, and has no existence save in his own imagination. This is exactly what "Induction" has done. We have no particular business to tell him of it, but the marked personality of his criticism, its wasted use of good English to prove that Mr. Prescott has stultified himself in theories he never presented, seems to call for our interference in a brief article, and gives us an opportunity to say a word on the general subject.

If "Induction" will again read Mr. Prescott's article, he will find that no theory has been advanced at all, but an experiment stated. The only point which at all seems like theorizing is a reference to one of the simplest facts known to every boy who knows how to put a battery together, or arrange them in connection with the wires they charge. That is, while two wires, earthed at two distant cities, with main batteries on each, and with like polarity, will work with perfect harmony and without interference, the instant the termini of these wires at one of the cities, or at both, are disconnected from the earth and connected with each other, action ceases, the batteries neutralizing each other. Is there anything mysterious in this? What has such a statement as this to do with a shunt? This well known fact was applied in the illustration of the Auroral waves, which by depriving the wires of one earth connection by uniting two wires in the manner described, neutralized their action, if any action was possible, except in the very limited degree to which all ferruginous matter is excited which has contact with electric atmosphere. It simply took the circuit from them, they had no medium for return, and the action was nil. There was no action at all.

We cannot find occasion to change our own statement that the Auroral action on the wires is caused by solely terrestrial electric disturbance, and that earth connections are essential for their exhibition. Humboldt says: "Recent experiments have failed to show a connection between polar light and atmospheric electricity, since, during the finest Auroras, no change has been detected in very sensitive electrometers. On the other hand, all of the three manifestations of terrestrial magnetism, the declination, inclination and force, are affected in a very sensible manner, the same end of the needle being sometimes attracted and sometimes repelled in the course of the same night." The luminous phenomenon is regarded by Humboldt as the restoration of the equilibrium temporarily disturbed, the termination of a magnetic storm.

The Aurora is to be regarded as the result of a state of telluric activity—excited to the production of a luminous phenomenon. Wires without earth connections are not appreciably affected by them.

"Induction" seems to intimate that wires have been worked by atmospheric electricity without earth connections. We would be glad to learn of one clearly defined case, except that there is a slight current observable at wires whose termini have different altitudes. That current is too slight to affect the general statement. The Auroral current we believe to affect the telegraph wires more or less at all times when they are in their usual condition with their ordinary earth connections, and not otherwise to any appreciable extent. Metallic circuits are not appreciably affected by lightning.

We take occasion to say to critics that in the treatment of subjects in which so much has yet to be learned, it is both wise and mainly to be modest in the claim of superior knowledge, or in the assertion of its absence in others.

### Rights of Foreign Companies to Land Cables on the Shores of the United States.

By the decision of Attorney General Hoar, which will be found elsewhere, the claim of exclusive admiralty and maritime jurisdiction by the Federal Government asserted by Congress is maintained. The jurisdiction is, by the language of the Constitution, exclusive, and has been uniformly sustained in all the great cases where the question has entered into judicial proceedings. Interpreting "Commerce between nations" to mean, according to Chief Justice Marshall, not merely traffic, but intercourse, the authority of Congress "to regulate commerce" is decided by the Attorney General to apply to cables as a means of intercourse. Thus, with exclusive maritime jurisdiction for at least a league from shore on the one hand, and the regulation of commerce with foreign nations on the other, it is made obvious that no cable can be landed on the shores of the United States, from the shores of any foreign nation, without Congressional authority. It is equally clear that no State can grant this right. The Attorney General, also, regarding the means of international intercourse by cables as of vital public importance, in the use of which the question of even national existence may sometimes depend, emphasizes the right of Congress to deal exclusively with all applications to land cables on our shores in the clear, simple, terse decision which we commend to our foreign friends. It seems hard for Europe to learn that this is a compact nation having national rights and federal unity. No American would dream of landing a cable on the English coast without an Act of Parliament in his hand to show his right so to do; but, these Europeans have, somehow, imbibed the notion that, in America, it is only necessary to buy an acre of sand coast at Cape Cod or Cape May, and get consent of a State Legislature, and all is right. We welcome a free and wide intercourse with all the world, but we want it on a good, permanent, national understanding and consent.

Ha! Ha!! Ha!!!

From several sources we have received the following and have enjoyed a good laugh over it.

One day last week the manager of the telegraph office at Piqua, O., sent a message addressed to a person who resided near another office, which, from motives of delicacy we do not name, directing it to be dropped in the post office, probably because too distant for delivery. What was Piqua's amazement on receiving the following office message, we leave to all who read:

"Piqua, O., Office—

"No such post office in Delaware county as Dropin Post Office. Please give better address!"

Don't you believe the boys along that wire had a laugh that day over the Dropin Post Office?

"Do you charge for marriage notices?" writes a happy man to us. We answer no, we are only too happy to announce the formation of clubs for the perpetuity of the race of all good telegraph men. Nay more, if after a reasonable time, not sooner than the legal period, our happy advertisers are able to announce a dividend, however small, we shall be most happy to announce the same to a smiling world. If the dividend be double, we promise a special note thereof.

## The Atlantic Cables.

We are glad to welcome home our friend Cyrus W. Field, Esq. The effects of the injuries received just before his departure for Europe have almost entirely disappeared, and Mr. Field looks less like "retiring to a farm" than ever.

We are indebted to him, among other things, for the details of the Atlantic Telegraph business under the various tariffs which have been adopted, the result of which must be especially gratifying. The revenues have not been materially increased by three successive reductions of tariff, but the public use of the cable, as will be seen, has been greatly enlarged. To appearance, nothing more can now be desired. Yet time reveals her own necessities, and greater things are no doubt in store for us. In this we have confidence, that as, steadily and carefully, the tariff has been reduced to meet the widened and widening demand for international communication, without injury to the enterprise as an investment, so, in the future, we believe wisdom and liberality will continue to guide the counsels of those who manage its affairs. The marvellous condition of the cables themselves, and their increased perfection as conductors, encourages the exercise of great liberality.

### Number of Messages and Receipts Accruing to the two Cables between Valentia and Heart's Content under the different tariffs.

## STATISTICS OF TRAFFIC.

Number of Messages per Month.	Daily Average No. of Messages	GROSS RECEIPTS.	Average Am't per day.
1104 837 881	29	Aug., 1866, under £20 Tariff *£560 Sept. " " " 456 Oct. " " " 491	\$505
1530 1582 1686 1764 2147 2624 2262 1843 1432 1693 1860 2505 2292	64	Nov. " £10 " 502 Dec. " " 493 Jan. 1867 " 466 Feb. " " 549 March " " 666 April " " 722 May " " 705 June " " 597 July " " 542 Aug. " " 401 Sept. " " 515 Oct. " " 715 Nov. " " 671	\$579

"On the 1st of June, 1869, the tariff on Atlantic cable messages was reduced between any telegraph station in Great Britain and Ireland and New York, from £3. 7s. 6d. for ten words, and 6s. 9d. for each additional word, to £2 for ten words, charging for address and signature, and 4s. for each additional word. An important reduction was also made for newspaper press messages, and all political and general news conveyed from either side of the Atlantic made half rates, thus practically reducing press messages from 6s. 9d. to 2s. a word.

\* During this month the N. Y. Herald transmitted an average of over £100 per day, and many persons sent messages as it was a novelty.

† During this month the U. S. Government messages averaged over £100 per day.

‡ During these months there was extraordinary excitement in cotton, which fluctuated over 100 per cent. in Liverpool.

General Smith, President of the International Oceanic Telegraph Company, is now in England and in treaty with the Government and eminent electricians for the laying of submarine cables between Cuba, Jamaica and Aspinwall on the one hand, and Cuba, Hayti, St. Thomas, Barbadoes and Demerara on the other.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
JUNE 5th, 1869.

EXECUTIVE ORDER NO. 74.

ANSON STAGER.  
THOS. T. ECKERT,  
JNO. VAN HORNE. } General Superintendents.

Franks of this Company, limited to territory North of and bounded by the Ohio River, will be treated as including the Cities of Louisville, Ky., and St. Louis, Mo.

(Signed)

WILLIAM ORTON,  
President.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
JUNE 2, 1869.

Notice is hereby given, that the Annual Meeting of the Stockholders of The Western Union Telegraph Company will be held at the Executive Office of the Company (145 Broadway), in the City of New York, on the second Wednesday (14th) of July, 1869, at twelve o'clock, noon, of that day.

Notice is also given, that the Board of Directors have this day declared a dividend of two dollars a share on the Capital Stock of the Company, from the earnings for the six months ending June 30th, instant, payable at the office of the Treasurer, 145 Broadway, on and after July 20th, 1869. The transfer books will be closed on the afternoon of the 21st instant, and opened on the morning of the 21st July. Stockholders can apply for their dividends personally, or checks will be sent them upon their written request, or they can draw for the same through the banks where they do their business.

By order of the Board,

O. H. PALMER,  
Treasurer.

## Rule 28½.

We are requested to call attention to Rule 28½, in the Revised Regulations of the Western Union Telegraph Company. The route of a message from a connecting line decides its tariff, and unless the name of the connecting office is given, the check is not only liable to be incorrect, but the wrong office may be checked. All these irregularities cause correspondence and multiplied labor, which can be avoided by attention to the rule referred to. When a message is received from a connecting line to be forwarded, state distinctly the name of the office at which it was received.

While we are about it, we take occasion again to direct attention to a request, often made, that messages for large cities should have a full address. This is especially needed in messages coming to seaboard cities. Unless this request is heeded, delay and disappointment are always liable to occur. Demand and send a full address. He that hath ears to hear let him hear—and she also.

## Recreation.

Health is happiness. So said George Combe. We believe him. Health is wealth. Health is better to some men than the Dictionary or a collegiate education. It gives sense. Good bowels give good judgment and healthy theology. We are in favor of and admire health wherever it is visible. The laugh of a healthy man is better for a dyspeptic to inhale at both ears until it starts reciprocal cachination, than any number of grosses of Brandreth's Pills or Plantation Bitters 1860 X, taken in between the teeth.

So we are glad to hear from our old friend "Voyageur," that the telegraph boys are at base ball again. It is a good thing to do. It is exercise for mind and muscle. Superintendent Williams, of Cincinnati, approves it, and therein shows himself a scholar. We are told he knows how to hold a bat himself. Of course he can, he is an Owl. Base ball makes us restive in this easy chair, and causes it to feel very like a plank. We wish we were an Owl also. Tumble in boys; good play will insure good work. The Telegraph Company needs sound men. Base ball is a prime juvenator and restorer.

## UNPARALLELED SUCCESS.

THE FIRST EDITION DISPOSED OF IN FOUR WEEKS.  
SECOND EDITION NOW READY.

THE STANDARD AMERICAN WORK ON THE TELEGRAPH.  
MODERN PRACTICE

OF THE  
ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

1 Vol., 8vo.

PROFUSELY ILLUSTRATED.

BY FRANK L. POPE.

This book supplies what has long been recognized as the great desideratum in *American Telegraphic Literature*. It is a THOROUGHLY PRACTICAL TREATISE,

and should be in the hands of every Electrician, Superintendent, Operator, Line Builder, Repairer and Batteryman. It contains full descriptions and explanations of all the

MODERN IMPROVEMENTS IN TELEGRAPHY, which stood the test of actual experience. The work also contains the new system of

TESTING BY MEASUREMENT,

which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines.

The Appendix contains a large amount of useful and practical information, formulas, tables, &c., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever required, with

ELEGANT ENGRAVINGS,

most of which have been engraved expressly for its pages by the best artists.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

Prof. S. F. B. MORSE writes: "I have had time only cursorily to examine its contents, but this examination has resulted in great gratification, especially at the fairness and unprejudiced tone of your whole work. Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."

Gen. ANSON STAGER, General Superintendent of the Central Division of the Western Union Lines, writes: "I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed. A familiarity with its pages will, I have no doubt, render your work standard authority among practical telegraphers in this country on all matters concerning the Electric Telegraph of the present day."

Many other highly complimentary letters have been received from Mr. J. VAN HORNE, General Superintendent of the Southern Division, Western Union Co., and others, which want of space prevents publishing.

WHAT THE PRESS SAYS OF IT.

(From the N. Y. Herald).

"This is an admirable work. \* \* \* We know of no other work of the kind so well adapted as this is to all who desire to become intimately acquainted with the wonderful science of the Electric Telegraph."

(From the N. Y. Sun).

"\* \* \* An excellent work by FRANK L. POPE, a gentleman whose long experience fully qualifies him for the duty he has performed. \* \* \* The book will be exceedingly valuable to all who are studying electrical science and the art of telegraphing. Packard's Monthly says his book is full of that kind of information most prized by practical operators, and will find its legitimate place in the working offices."

The work has been very generally and favorably noticed by the press.

Notwithstanding the great expense incurred in the publication of this work, it is offered at the very low price of \$1.50.

On receipt of the price of the book, it will, if desired, be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Orders should in all cases be accompanied by the money, to insure prompt attention, and if sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to FRANK L. POPE, Box 6133, or to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS,

PUBLISHERS,  
28, 30, 32 Centre Street.

The work may also be had of the following, who will keep it on hand and for sale:

D. Van Nostrand, 23 Warren and 27 Murray streets; L. G. Tilton & Co., 11 Dey street; C. T. & J. N. Chester, 104 Centre street; Chester, Patrick & Co., 38 South Fourth street, Philadelphia, Pa.; W. H. Young, Washington, D. C.; Charles Williams, Jr., 109 Court street, Boston, Mass.; S. C. Rice, W. U. Telegraph Office, Albany, N. Y.; C. W. Northrup, A. & P. Telegraph Office, Rhinebeck, N. Y.; Bliss, Tilton & Co., 171 South Clark street, and L. C. Springer, 162 South Water street, Chicago, Ill.; A. L. Gardner, Greencastle, Ind.; Frank Lehmer, W. U. Telegraph Office, Omaha, Neb.; S. E. Freuch, C. & N. W. R. R., Chicago, Ill.; Lundberg, & Marwedel, San Francisco, Cal.; R. Valentini, N. W. Tel. Co., Milwaukee, Wis.; J. J. G. Riley, B. & B. Tel. office; H. Craig, B. & O. R. Tel., Camden Station, Baltimore, Md.; G. A. Hamilton, P. & A. Tel. Company, Pittsburgh, Pa.; W. H. Woodring, St. Joseph, Mo.; C. H. Sewall, Franklin Tel. office, Boston, Mass.; Chas. E. Higden, W. U. Tel. office, and W. F. McClure, P. & A. Tel. office, Burnett House, Cincinnati, Ohio; Geo. L. Walker, T. P. and N. R. R., Peoria, Ill.; L. Præcette Archibald, W. U. Tel., Truro, Nova Scotia; M. D. Buckwell, B. & B. Tel. office, Philadelphia.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
JUNE 15, 1889.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since June 1, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Allegheny Springs, Va., tariff same as Christiansburg, Va.  
Booneville, Mo. Offices having Illinois and Mississippi maps will use map tariff, all other offices will add 80c. to St. Louis, 1.30 to Chicago or 1.05 to Omaha, taking as the rate the lowest amount after adding.  
Creason Springs, Pa., re-opened, tariff same as heretofore.  
Cromwell, Iowa, tariff same as Osceola, Iowa.  
Denver, Ill., tariff same as Carthage, Ill.  
Elliston's, Ky., tariff same as Falmouth, Ky.  
Jordan's white Sulphur Springs, Va., tariff same as Winchester, Va.  
Neponset, Mass., tariff same as Harrison Square.  
Inwood, Ind., tariff same as Bourbon, Ind.  
Norrl, Ill., tariff same as Bement, Ill.  
Norris, Ill., tariff same as Farmington, Ill.  
Martinsville, Ind., tariff 5c. more than Indianapolis from offices East and North thereof, and 5c. less from offices West and South.  
Oakland, Md., re-opened, tariff same as heretofore.  
Princeton, Ark., tariff same as Pine Bluff, Ark.  
Rynd Farm, Pa., tariff same as Rouseville, Pa.  
Point of Rocks, Wy., re-opened, tariff same as heretofore.  
Sharon Springs, N. Y., re-opened, tariff same as heretofore.  
Shortsville, N. Y., tariff same as Geneva, N. Y.  
Sparta, Ky., tariff same as Midway, Ky.  
Trenton Falls, N. Y., re-opened, tariff same as heretofore.  
Walton, Ky., tariff same as Butler, Ky.  
Worthville, Ky., tariff same as Bagdad, Ky.  
Bethlehem, N. H., re-opened, tariff same as heretofore.  
Boar's Head (Hampton Beach), N. H., re-opened, tariff same as heretofore.  
Crawford House, N. H., re-opened, tariff same as heretofore.  
Glen House, N. H., re-opened, tariff same as heretofore.  
Profile House, N. H., re-opened, tariff same as heretofore.  
Jackson, N. H., re-opened, tariff same as heretofore.  
Rye Beach, N. H., re-opened, tariff same as heretofore.

## OFFICES OPENED ON OTHER LINES.

Clifton House, Niagara Falls, tariff 35 and 2 from Buffalo, N. Y.  
Check Buffalo.  
Harwood, Ont., tariff 35 and 2 from Buffalo. Check Buffalo.  
Pequot House, Conn., tariff 25 and 2 from New London, Conn.  
Chech New London.

## OFFICES CLOSED.

West Point, Ark.; Jacksonville, Ala.; Summit, Miss.; Fort Steele, Wy.; Black Buttes, Wy.; Trempleau, Wis., and Cranford, N. J.

## TO OFFICES "HAVING SPECIAL SHEET A."

Royal Centre, Ind., same as Logansport, Ind.  
Seneca Falls, N. Y., same as Clyde, N. Y.

## GENERAL INFORMATION.

Greensburg, Pa., in last JOURNAL should be 45 instead of 50c. from New York, and Weola, Iowa, should read Neola, Iowa.  
The tariff to Dunmore and Hyde Park, Pa., will hereafter be same as Scranton, Pa.

WILLIAM ORTON, President.

## Married.

May 17th, at the residence of the bride's step-father, D. C. Chidney, by the Rev. Dr. Massey, Sam J. Hoffman, of the Western Union Telegraph Company, to Miss Emma E. Pierce of Mobile.

On Tuesday afternoon, May 25, 1889, at the First Presbyterian Church, Des Moines, Iowa, by the Rev. A. A. Dinmore, Mr. Anthony P. Prichard, Manager of Western Union Telegraph Office, Granville, O., formerly Superintendent of Telegraph and Train Dispatcher Ky. C. R. R., to Miss Louisa A. Leas, daughter of Hon. Charles A. Leas of Funchal, Madeira Islands.

In Germantown, Ohio, June 24, by Rev. J. Stierwolf, Mr. John W. Ford, Manager, Office of Western Union Telegraph Company, Fort M'Pherson, Neb., to Miss Celia Kaucher of Germantown, O.

## Telegraphers' Mutual Life Insurance Association.

## ASSESSMENT No. 8.

The death of our brother C. J. Gaines, of Richmond, Va., as announced in the letter of Mr. Paynter, the manager of the Richmond office, calls for a remittance of one dollar from every member whose certificate dates previous to May 25th, at which time the number of certificates issued was 550.

The case of Mr. Gaines' family is one which again illustrates the usefulness of the association in providing for those who are left without any means to provide even the decencies of burial. Too many are just in this condition, even where the heads of the family are temperate and consistent in their expenditures. Brothers! here is another deserving family to whom you have ministered in their darkest hour. The instant the death was known, three hundred dollars was at once remitted, and the balance of nearly \$200 soon afterwards. Let your remittances be made promptly, addressed D. R. Downer, Secretary, 145 Broadway, N. Y., Box 3,393.

## ASSESSMENT NO. 8.—ASSESSMENTS RECEIVED.

D. A. Van Ham,	John C. Thomas,

	G. M. Hubbard.

The sale of "Pope's Practice" continues as brisk as ever, and has proved a very practical success. To those who desire it, we send copies on the receipt of the price—\$1.50.

## The New Tariff Book.

Managers and receivers will be glad to hear that the new tariff book containing tariff to all Western Union and "other line" offices, together with rates to Europe and Cuba by the cables, is nearly completed and will be issued very soon.

## The Future American.

What will be the size, color, religion and physique of the future American, not even the gifted seer, who reveals the future at the moderate price of fifty cents a revelation, can even wildly guess. Mormonism in Utah, Paganism in California, Calvinism in the Eastern States, and Don't-care-a-darn-ism in the Middle States, will make a tremendous jumble when the materials, as they inevitably shall at some future time, become somewhat mixed. Shall stubtoes and almond eyes affect our belles as now do the golden locks and Hottentot protuberance? Will the Oriental blood, destined to be mixed with the Anglo-Saxon-Celt-Indian Negro puddle, color our future legislation, and tone down the angularities of our institutions? Physiologists of the old-granny school are in the habit of reiterating at every opportunity that the average American is abnormally a busy individual, and needs rest for his overstrained nerves. Perhaps the vast importation of biped Asiatic languor is a wise dispensation of Providence, meant to allow us that habitual laziness which we can not now enjoy.

However, thank Heaven! before the crop of Chinese Americans begins to exercise a perceptible influence on our national institutions, we of the present day will be far above or below all these brain bewildering enigmas.

## CHESTER, PARTRICK &amp; CO.,

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES.

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES.

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

## IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

## THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

## THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with a

## GREAT AND UNIFORM STRENGTH.

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

## THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost New way Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer.

### The New Atlantic Cable.

"The French Cable," as it is familiarly called, has been made, and will be laid from English ships, by Englishmen, the Telegraph Construction and Maintenance Company having undertaken the contract, Sir Samuel Canning being the engineer-in-chief of the expedition, and the Great Eastern having been chartered for the work.

The present cable is some twelve hundred miles longer than either of its predecessors; it is divided into several sections, and has been manufactured at the rate of 150 miles a week ever since the contract was accepted.

The Great Eastern carries 2,752 miles, or about 400 more than when it left with the Anglo-American Cable—its vast receptacles being made still vaster, and its main tank considerably enlarged. With this cargo the great ship designed to leave her present resting place in the Medway about the 10th of June, and proceed to Portland. Here a few days will be spent in taking in coal, after which she will go to an appointed spot some five and a half miles from Brest. One of the vessels of the expedition (the Chiltern) will in the meantime have laid the heavy shore end, and this will be buoyed out at sea at the distance named. The Great Eastern will, somewhere about the 20th of June, pick it up, and after splicing and testing, will set about her regular work of cable-laying, under Sir Samuel Canning and his staff. She will be accompanied by the Scanderia, a fine vessel of 1,800 tons and 370 feet long, now lying alongside her in the Medway, and by the Chiltern, both ships being fitted up with grappling irons, buoys, and picking-up machinery, which are identical in every respect with those on board the Great Eastern herself. It will be remembered that in Mr. Deane's narrative of the expedition of 1866 the parts played by the ships Albany and Medway, during the search for and grappling with the lost cable of the preceding year, were of the greatest importance. It is intended that the Scanderia and the Chiltern shall be equally serviceable in case of need.

Some eighteen days will be occupied by the Great Eastern in the voyage from Brest to St. Pierre; and immediately on the line being laid between these two places, the other cable-laying vessel will carry on the remainder of the work. For in addition to accompanying the monster vessel as an escort, and giving her assistance should she require it, the Scanderia, the Chiltern, and another ship, the old William Cory, will each bear portions of the cable across the Atlantic. The latter proceeds to St. Pierre early in June, and having laid a shore-end there will buoy the course and wait the arrival of the Great Eastern. This over, Sir Samuel Canning will leave the latter ship, which will return to England forthwith, and will take his place on board the William Cory. Another shore-end, of course in direct communication with the line to Brest, and one hundred and seventy-four miles of cable will be laid. Then Sir Samuel Canning changes ships again, and splicing this portion with that on board the Scanderia, proceeds on board the latter vessel to lay 450 miles more on the way to Boston. The Chiltern and her cargo are called into requisition next, and another splice made. The 152 miles added now carry the cable direct into Boston, and the line will be thus made complete between the latter place and the French port.

After St. Pierre the real work is over. The rest is shallow water, the whole of which has been sounded, and the greatest depth of which is ascertained to be 360 fathoms. Between Brest and St. Pierre the depth of the line in which the cable is to lay is less accurately known, and there are variations between the soundings taken at various times. These are, however, being verified and corrected, and full information will be secured before the expedition starts.

We have said that the Great Eastern has more cable on board her by some hundreds of miles than she has ever held before. In all essentials for sea-going the great ship is in better trim than ever. Her bottom is freer from rubbish and impediment than has been the case since she was new, and the work bestowed upon her while on the gridiron at Liverpool has been already proved to have an appreciable effect upon her power.

Her rudder is now worked by steam, and in place of the twelve men who formerly were engaged below the deck aft, one seaman stands upon the bridge connecting

the paddle-boxes, and from here manoeuvres the great ship as easily as if she were a toy, obeying each word of captain or pilot literally by a turn of the finger.

Sir Daniel Gooch, Bart., M. P., will go out in the Great Eastern as chairman of the company which makes and lays the cable; and several of the French directors, and a selection of English electricians, including Sir William Thomson, will be also on board. There will be no ladies, however, and so far as is known, no one without a distinct task to perform. Mr. Willoughby Smith will, as formerly, act as the electrician of the company. It should be mentioned that the electric tests of the cable have been, and are, continuous, and that not a single fault has been discovered in it from the commencement of its manufacture until now. In addition to the task before her, the Great Eastern leaves for Bombay with the British Indian cable, together with Sir Samuel Canning and his staff, early in November next.

It seems we were imposed upon in publishing the notice of marriage, R. H. Alston of Patona, Ala., to Miss Hudson. Practical jokes of this character are mean and offensive to the parties concerned, and no gentleman will ever be guilty of their perpetration.

### SHAWK & BARTON,

### STICKWELL & CO'S

#### EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

#### STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

TELEGRAPH ENGINEERS.

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## Journal of the Telegraph.

## France.

Brest, June 11.—A grand banquet was given on board the steamship *Great Eastern* last evening to celebrate the successful loading of the new French cable. Many notables were present. Speeches were made and toasts drunk, and altogether much enthusiasm was manifested. Among the toasts were "England," "America" and "France," which were appropriately responded to by representatives of the several nations. The festivities were continued till a late hour.

The *Great Eastern* has gone to Portland, England, for her supply of coal, and will leave that port to-morrow for Brest, whence she will soon proceed to lay the cable to the United States.

The contracts for telegraphic news service between the New York Associated Press and the New York State and the New England Associated Press organizations have been signed.

West Point, June 9, 1869.—Yesterday the Field Telegraph Corps was reviewed and exercised on the parade ground. At five o'clock the heavy wagon of the corps—not unlike an ambulance in appearance—drove upon the ground. A party of cadets, in the usual dress of gray coats and white trousers, preceded it. Two, provided with pickaxes, made holes in the ground, into which two more thrust the longer slender poles, another having just before adjusted the wire to the top. In a very short space of time the line is erected quite around the parade ground. The working apparatus occupies a convenient shelf in the telegraph wagon, and is under the supervision of two cadet operators. All this is, of course, a comparatively new feature in military education, but its importance has been fully demonstrated in all recent wars.

On the evening of June 10th, the weather rainy and the atmosphere damp most of the distance, the wires to Plaister Cove from New York, 1260 miles, worked in a direct circuit without the aid of repeaters.

We print and circulate 8,000 copies of the present edition of the JOURNAL.

## The China Telegraph Enterprise.

A Washington dispatch to the Associated Press states that Governor Curtin, as President of the East India Telegraph Company, having requested the Navy Department to extend such aid to that enterprise as might seem proper, Secretary Borie has instructed Admiral Rowen, commanding the United States Asiatic squadron, to give full protection and render all the assistance within his power to the work of laying the cable of the above named company, and to manifest to the Chinese authorities the deep interest which this government feels in the success of the enterprise. Post Captain Alexander is detailed to proceed to China and give the benefit of his aid and experience in making the preliminary survey and soundings.

## St. Domingo.

Mr. Hartmount, an Anglo-American banker, has received a charter for a railroad and telegraph line from Monte Christo to the great interior vega of Santiago. Prof. Gabb, the State Geologist, has nearly completed the survey of the gold fields of Columbus; and his Assistant, Mr. Curtis, is occupied in mapping out the principal mining sites, which are to be offered in Europe and the United States on lease.

No force, strictly speaking, can be initial, as there must be some *anterior* force which produced it. We cannot create force or motion any more than we can create matter.

## South America.

A contract has just been signed for establishing a line of telegraphs to connect all the important points in the four provinces nearest to the city of Buenos Ayres. The contractor is Edward A. Hopkins, from the United States, and long a resident in these countries. His experience in public enterprises, his energy and the favorable terms given by the Government, make this enterprise certain of success. It will do much to fasten together these provinces.

## The Nonpareil Relay.

We are glad to learn that Mr. Durant's ingenious self-adjusting relay has proven to be a decided success. Numerous testimonials prove its excellence and acceptability, and, better still, the increasing reception of orders for its manufacture. No one better deserves success.

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York. The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLE—

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## BENEDICT BROTHERS,

No. 691 BROADWAY,

BETWEEN AMITY AND FOURTH STREETS,

JEWELERS,

KEEPERS OF THE CITY TIME,

FINE WATCHES, CHAINS, DIAMONDS,

AND

SOLID SILVER WARE.

AGENTS FOR THE AMERICAN WALTHAM WATCH.

Watches Repaired in the most thorough manner, and Warranted.

## SPECIAL NOTICE.

Since the 1st of September a new and valuable improvement has been attached to all the Watches made by the American Waltham Watch Company, namely: Fogg's Patent Pinion, and also the Sprung Over Regulator.

We cheerfully recommend these additions, as they are desirable improvements to this celebrated Watch.

The Patent Pinion prevents injury to the Watch in case the main spring should break. The additional charge is only two dollars.

We again call attention to the fact, that in ordering a Watch by letter, the name and address must be written plainly.

We furnish a free Price-List of these Watches, which please compare with that of any other House before purchasing.

BENEDICT BROTHERS,

Agents for the American Waltham Watch,

691 Broadway.

## DURANT'S

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

## SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

Mr. Geo. E. Seibert, Western Union operator, 145 Broadway, New York, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a self-adjuster in every respect."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH of Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Agent for the sale of the Nonpareil Relay on the Pacific Coast, Mr. STEPHEN D. FIELD, San Francisco, Cal.

Address all orders to

CHARLES DURANT,  
Office and Factory, 86 Nassau Street,  
New York City.

**L. G. TILLOTSON & Co.,**

11 DEY STREET, NEW YORK,

MANUFACTURERS OF  
TELEGRAPH INSTRUMENTS

AND

MATERIALS OF EVERY DESCRIPTION.

General Agents for the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

The Compound Wire has now stood every test to which it can be subjected. Over twelve hundred miles of it are now in operation with the most satisfactory results.

General Agents for the Bishop Gutta Percha Co.'s

TELEGRAPH CABLES,

GUTTA PERCHA AND OTHER INSULATED WIRES.

General Agents for

PURE NITRIC AND SULPHURIC ACIDS,

Manufactured by the Lodi Chemical Works.

Importers of the best manufacture of

ENGLISH GALVANIZED WIRE.

Publishers of Prof. J. E. Smith's

MANUAL OF TELEGRAPHY.

GROVE,

CARBON

HILL'S,

DANIELL'S,

And every description of

BATTERY ALWAYS ON HAND.

**DR. L. BRADLEY,**

No. 7 EXCHANGE PLACE, JERSEY CITY, N. J.,

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed. His Relays were awarded

THE FIRST PREMIUM

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill O. O. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office order, in which case we will make no charge for package. He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

**BLISS, TILLOTSON & CO.,**

OF EVERY DESCRIPTION.

CABLES

Of any desired Size and Pattern. American Manufacture. We shall be happy to answer all inquiries and furnish any required information promptly.

L. G. TILLOTSON &amp; Co.

No. 11 Dey street, New-York.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET, PHILADELPHIA.

The guarantees of this insulator are :

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather?

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.

**THE BISHOP GUTTA PERCHA COMPANY,**

The Original and Only Manufacturers in the United States of every description of

PURE GUTTA PERCHA GOODS.

INSULATED SUBMARINE TELEGRAPH CABLES.

INSULATED TELEGRAPH AND ELECTRIC WIRE.

The Insulation of Telegraph and Electric Wire with Gutta Percha has been adopted by the manufacturers of these articles, in Europe as well as here, and in an experience of over TWENTY YEARS has never failed.

We also Manufacture

WATER, BEER AND SODA PIPE,

CHEMICAL VESSELS,

GUTTA PERCHA SHEET OF ALL THICKNESSES,

TISSUE SHEET FOR HAT AND CAP MAKERS' USE

COTTON AND SILK COVERED WIRE,

BRIDGE'S ELECTRIC CORDAGE,

BISHOP'S COMPOUND CORDAGE, &amp;c., &amp;c.

## The First Locomotive.

Pen-y-darran, Wales, is chiefly remarkable for its connection with the first tramway—for which an act of Parliament was obtained in 1803 for the first locomotive ever tried—and with the able inventor, Trevethick, who there made his first essay. The first run of the locomotive occurred in February, 1804. Previously there had been a whisper in the scientific world of the use of steam and of its employment in propelling vehicles, and abortive attempts having been frequent. Samuel Homfray by some means was brought into connection with Trevethick, and the result was that this able but eccentric man visited Methyr and in conjunction with a self-taught mechanic, one Rees Jones, whose homely portrait can be seen in the Kensington Museum, began to build his locomotive. Building is not an inappropriate word in this case, for the stack was actually built up of bricks the same as an ordinary chimney, and the whole affair was peculiarly odd. The stack was tall and clumsy, the body dwarfed, perched on a high frame-work, so as to approximate to the spider fashion; the cylinder, in addition, was upright; the piston worked downwards, and at every revolution of the wheels there was a monstrous clang produced which, heard now-a-days with the asthmatic puffs of steam, would provoke the gravest mechanic to laughter. When completed, Homfray introduced his friend Richard Crawshay to the novelty, doubtless much to that individual's amusement, certainly to his incredulity as to its being fit for anything, for he readily accepted a wager with Homfray for £1,000, maintaining that it would not convey a load of iron from Pen-y-darran to the navigation—a distance of nine miles. The eventful day arrived for the trial, and never had there been so much excitement. The sturdy Englishmen were there, and natives from every Welsh county lined the road, and mounted every eminence that commanded the tramway; and when Trevethick jumped on his iron steed, and began slowly to move onwards amidst clanging iron and puffing steam, the uproar was terrific. By the arrangements made no one was allowed to assist the dauntless Cornishman, and for a time he did not seem to want it. Surrounded by a host, he passed down the valley, making about five miles per hour, when a sad misfortune happened—the clumsy stack came in contact with a bridge and was ruined! Trevethick stood for a moment amongst his bricks, but only a moment. Fertile in resource, he was soon steaming onward again, and not only conveyed his load of iron to the navigation, but a crowd of exultant passengers along with it, who to their latest day prided themselves on their glorious ride. It was fortunate for Homfray that the wager was a loose one. The iron was taken down and the bet won; but Trevethick failed to bring his empty trains back, and for some time the new in-

vention as a mode of transport remained in abeyance. —*London Engineer.*

## Is the "Modern Telegraph an English or an American Invention."

In a review in an English Magazine of the excellent work "History and Progress of the Electric Telegraph by Robert Sabine, C. E., London," we find the following passage, after first giving just commendation to the work in question:

"We do not wish to diminish one iota the credit due to Morse for the invention of the simplest, most perfect and most universal telegraph in existence; but we protest against his being allowed priority of claim."

MORSE'S DOUBLE REGISTER OF 1835.

We do not object to his immortality. If ideal conversations are to rank as inventions then should Galileo be called the inventor of the telegraph.

"Morse acknowledges having first received the conception of a telegraph in 1832; Wheatstone had been studying the subject years before this. Cooke and Wheatstone's telegraph was patented in the early part of 1837, and Morse's in the latter part of the same year. The first line of telegraph was erected by them in 1838, and the first line constructed in the United States was put in operation in the month of June, 1844. Cooke and Wheatstone's first 'hatchment' telegraph was a beautiful and practical instrument; Morse's first relays weighed 158 pounds, and required two men to carry them.

"We contend that the author's lights in meting out immortality have not been sufficiently luminous. We

say Cooke and Wheatstone first, Morse a good second, Steinheil a bad third, and the rest nowhere."

We have a few words to say on these remarks of the English reviewer. While there is no dispute between us that the universal verdict of the world is that "Morse's invention is the simplest, most perfect and most universal telegraph in existence," we are obliged to dissent in toto from the inconsistent protest of the reviewer against what he styles "Morse's priority of claim." What does he mean by "priority of claim?" Is it a claim of priority? This only redeems the expression from ambiguity. But what has Morse claimed to which he is not entitled? We do not find in the whole history of his invention that he has ever claimed to be the inventor of *communication at a distance*, a result which has long been accomplished from time immemorial by various modes; but he does claim to be the inventor of a particular mode, which is correctly called by the name of the *Telegraph*; since his mode completely fulfils the definition of the word, which was never before fulfilled. He does not claim to have first applied electricity to communication at a distance, but he claims to have first applied electricity to create a *Telegraph*. This is his claim, and no one has yet established a prior claim. He is not singular in putting forward this claim. Three of the judges of the United States Supreme Court, in their official decision, take the same view of the matter; and their decision has been published for more than fifteen years. We gather some of these facts from a publication of Morse recently made in Paris, in which he clearly defines the difference between a *Telegraph* and a *Semaphore*. Mr. Sabine, the learned author of the excellent work on Telegraphy which the reviewer has under examination, in a late article in an English journal, discussing this very subject says, "If the word *Telegraph* means a system of writing at a distance, Prof. Morse is perfectly right, for in the earliest systems *no writing* was done, at least by the instrument." This remark concedes all that is necessary to define

and establish Morse's priority. The conditional "if" can be decided only one way, for the word "Telegraph" does mean "a system of writing at a distance," and this is a mode of communicating at a distance, first devised and accomplished by Morse. Mr. Sabine admits that in this "Morse's reasoning is sound," and he adds, "I perfectly agree with him in the distinction which he draws between electric Semaphores and electric Telegraphs," and in this connection Mr. Sabine combats the confused and erroneous idea that Morse claims the magnetic Semaphore. He says "it is not the electro-magnetic Semaphore that Morse claims the invention of, but the electro-magnetic *Telegraph*." The reviewer seems not to have comprehended the essential difference between them, or he never could have made such an erroneous chronological classification.

He states it thus—

"Cooke and Wheatstone—first,  
"Morse a good—second,  
"Steinheil a bad—third,  
"And the rest nowhere."

Let us analyse this statement—"Cooke and Wheatstone's invention was an improvement upon a previously existing needle Semaphore, which needle system they were indeed the first to improve and make practical in 1837, and they patented it in the same year. Morse originated and invented the first real Telegraphic system in 1832, showed its practical operation in 1835, and patented it in 1838, specifying it in caveat in 1837. Steinheil invented a needle Telegraph (not a Semaphore), in 1837. It was never patented nor practically introduced. Now each of these several inventions being essentially different, each of the inventors may justly claim priority for their own class of inventions, regarded as inventions; but in their chronological relations to each other, that is, the order of time in which these several systems were invented, patented and established, and confining ourselves to the three mentioned by the reviewer, the following table correctly shows the facts:

TELEGRAPHIC.	SEMAPHORIC.
<i>Date of Invention.</i> Morse's, 1832. Steinheil, 1836, 1837.	<i>Date of Invention.</i> Cooke and Wheatstone, 1836, 1837.
<i>Date of Specification and Patent.</i> Morse's, 1837, 1838. Steinheil specified, 1837, 1838. Never patented.	<i>Date of Specification and Patent.</i> Cooke and Wheatstone, 1837.
<i>Date of Practical Establishment.</i> Morse, 1844. Steinheil never practically established.	<i>Date of Practical Establishment.</i> Cooke & Wheatstone, 1836-1837.

The reviewer's paragraph of dates is a strange mixture of incorrect assertion and irrelevant facts.

There is no evidence that Morse "received the conception" of a Telegraph from any one—it is clear that it originated in his own mind in 1832.

Wheatstone had not "been studying the subject years before." The date he himself gives of his first studies in electricity having any reference to telegraphy is 1834. The Telephonic instrument in 1828 which he attempted to make, was not a telegraph; had nothing to do with electricity, and was an acknowledged failure. The date of the respective Patents of Morse, and of Cooke and Wheatstone, decide nothing as to the date of their respective inventions, but supposing them to be the same inventions (which is not the case), Morse's was specified before theirs.

Neither does the date of the first establishment of a telegraphic line decide anything as to priority of invention. An invention may exist, and often does exist, years before its establishment.

The form or the weight of the first relay of Morse's (a portion only of his invention), so persistently misconceived and misrepresented in some of the histories of the telegraph, has no conceivable bearing on priority of invention. Whatever the weight of the relay, it was effective for its purpose, for we find it was practically used on the first line from Washington to Baltimore; and it is a noticeable fact, that after all the subsequent improvements and attempts at improvements in reducing the size and weight of the relay (many of which, by the by, were early made by Morse himself), the fundamental principles embodied in that first relay, that of using large wire instead of small for the helices, is being reverted to in the more modern construction of the relay.

We confess to not understanding the application of the remark—"If ideal conversations are to rank as inventions, then should Galileo be called the inventor of the telegraph." If Galileo ever had any such "ideal conversation" respecting a telegraph it is news to us, nor do we know of any claimant of the telegraph who bases his claims upon any "ideal conversations;" certainly Morse makes no such claim. On this subject the reviewer is somewhat foggy.

## On Some Applications of Electricity to Naval and Military Purposes.

BY F. A. ABEL, F.R.S., FOR. SEC. C.S.

[From Chemical News.]

(Concluded from page 159).

There are two distinct systems of applying electricity to the explosion of torpedoes. The most simple is that in which the explosion of a torpedo is made dependent upon the completion of the electric circuit by operators stationed at one or more posts of observation on shore. The particular mode of arrangement and the operation to be adopted depend in great measure upon the nature of the locality to be defended by torpedoes. If this be a river or channel, the plan of arranging and exploding torpedoes is comparatively simple, but will serve sufficiently to illustrate the general nature of this system of applying torpedoes. The mines are arranged across the river or channel in rows or lines, converging towards a station on shore, to which the conducting wires are led which are to connect each torpedo with the exploding instrument. The operator at this station has it in his power, therefore, to explode any one of the torpedoes at will, by completion of the circuit through the particular cable and the earth. Some other position on shore is selected as a second station, which commands points of view intersecting the lines of torpedoes. The operators at the two stations are placed in telegraphic communication with each other, and when a ship is observed by the operator at the second station to approach the direction of any one of the torpedoes, he will signal to the man who looks along this line of torpedoes, and the latter will complete circuit as soon as the vessel appears over the particular torpedo specified. Should the vessel alter her course in approaching the torpedoes, the operator at the observing station will inform the man at the firing station, who will alter his arrangements accordingly. Or, the man at the observing station, when he perceives a vessel to approach in a line with any of the torpedoes, places the cable of that torpedo in electric connection with the operator at the other station, and the latter will complete the circuit through the earth to the torpedo as soon as he sees that the vessel is over the first line of torpedoes. Other more or less elaborate modifications of these modes of observing and exploding have been proposed; they all depend for efficiency upon the experience, harmonious action, and constant vigilance of the operators at the exploding and observing stations. They are, moreover, entirely useless at night, and in any but clear weather. They are therefore not to be compared, in general efficiency, with self-acting electric torpedoes, which are either exploded by their collision with a ship, whereby electric circuit is completed within them, or by the vessel striking a circuit-closing arrangement moored near the surface of the water, whereupon either the torpedo, moored at some depth beneath, is instantly exploded, or a signal is furnished at the station on shore, which indicates to an operator the particular torpedo to be exploded. The object to be attained in these circuit-closing apparatus, which are so moored as to be within range of a passing ship, is to oppose in the path of a vessel a contrivance which will not be affected by the motion of the water, but which will complete electric circuit between the conducting cable and the fuse, if struck in some particular part, or thrown into a particular position, by the advancing ship. Numerous ingenious contrivances have been proposed for this purpose and experimented with, but in only two or three instances have satisfactory results been attained, the conditions essential to success being numerous, and their combined fulfilment not easy of

attainment. Simplicity of mechanism and a combination of sufficient, but not excessive, delicacy of action, with permanence during long immersion, are among the most important objects to be aimed at in the construction of these circuit-closing or signalling machines or self-acting torpedoes, which, if efficient, must contribute most importantly to the success of any arrangements for defense of a water by electric torpedoes.

It has been shown that magneto-electric instruments cannot be relied upon for submarine operations, on account of the perfect insulation of the conducting wires, joints, &c., required to ensure success with machines of that class. On the other hand, frictional machines and also dynamo-electric machines leave little to be desired as regards power to effect even the simultaneous ignition of numerous submarine mines through cables in the insulation of which, from long-continued use, some defects exist. These instruments, therefore, are available as most efficient instruments when any extensive submarine operations have to be accomplished; but the frictional machines cannot be used as the exploding agents in connection with any system of defense by torpedoes, which depends for its efficiency upon the explosion at the proper moment of only the particular torpedo over which a vessel passes, while all surrounding torpedoes still remain intact; because, for the reason which has been given, the explosion of the proper torpedo will almost invariably be attended by the accidental explosion of others which it is not desired to bring into operation. The same objection applies, at any rate to some extent, to the dynamo-electric machines. These two classes of instruments are therefore only susceptible of certain special applications in connection with submarine mines. There is, moreover, another general objection to the use of any source of electricity, the action of which is entirely dependent upon an operation to be performed at the instant that an electric discharge is required. This consists in the fact that, although the torpedoes may be self-acting, their efficiency is still dependent upon the vigilance and presence of mind of an operator on shore.

The only sources of electricity which thoroughly fulfil the conditions essential to its application with perfect confidence in connection with self-acting torpedoes, are constant voltaic batteries. By substitution of the Abel fuse for the old platinum wire fuse, it has become possible to use batteries which were previously inapplicable to the explosion of mines, because, even when employed in considerable numbers, the quantity of electricity furnished by them is not sufficient to effect the ignition of platinum wire. Thus, a number of elements of a Daniell's battery or a sand battery, quite incapable of heating a platinum wire to redness, fires an Abel fuse with perfect certainty. The heat developed in the latter by the passage of a current from such a battery amply suffices to raise to its igniting point the readily explosive priming mixture which serves as the conductor in the fuse. Moreover, the resistance presented by the fuse is so considerable in comparison with that offered by the longest cables which are likely to be used in actual practice, that a current from a battery which possesses tension sufficient to overcome the resistance of the fuse will explode the latter with as much certainty, through cables of great length, as when it is close to the battery. A number of cells of a Bunsen's battery, sufficient to ignite a piece of platinum wire several inches in length, when close to the battery, the current of which possesses also sufficient tension to ignite an Abel fuse, will be incapable of rendering a very short piece of thin platinum wire even moderately warm, if four or five hundred yards of ordinary conducting wire be introduced into circuit; but its power of exploding an Abel fuse will not have become at all affected. It is evident

from this illustration that the necessity for greatly adding to battery power, when mines are to be exploded through considerable lengths of wires, which exists with the use of the wire fuses, is obviated by employing the new fuse; and thus one great objection to voltaic batteries, as exploding agents in mining operations, is set aside. Again, the sand batteries, or Daniell batteries, which are used for telegraphic purposes, and which when once charged, continue, with very little attention, in constant and good working action for several months, may now be substituted for the batteries (e. g., Grove's or Bunsen's) which it was formerly necessary to employ in order to attain sufficient quantity of current, and which only continue in good action for a few hours. Sand batteries have been repeatedly employed at Woolwich for the explosion of fuses, after having been in action four or five months, with the occasional addition of a little water to compensate for evaporation.

It will be seen, from the foregoing, that constant voltaic batteries combine more thoroughly the essential qualifications of efficient exploding agents, in connection with any system of submarine defense, than all other sources of electricity at present known. They are simple of construction, inexpensive, require but little skill or labor in their production and repair, and very little attention to keep them in constant good working order for long periods. Their action is quite independent of any operation to be performed on shore at the last moment; it is only necessary to place the cables leading to the torpedoes in connection with the battery when it is desired to close a defended water—the circuit-closing portion of the torpedo, upon being struck by a ship at any time, will then cause the instantaneous explosion of the charge. The defense by torpedoes thus becomes as effective by night as by day; moreover, the efficiency of the constant batteries is not more prejudicially affected by the existence of defects in the insulation of the cables than that of the frictional electric machines; and they may be used without incurring any risk of the unintentional explosion of torpedoes by induced currents.

Simple and powerful forms of batteries are readily extemporized, and there is no more portable, simple or economical description of exploding instrument than the ordinary volta-pile, for the construction and employment of which it is only necessary to provide a piece of hard timber, some zinc and copper sheet, an old blanket, and some vinegar and common salt. A pile, composed of 120 elements, the plates being 2½ in. diameter, is very portable, and suffices to explode a mine in single circuit, or three or four arranged in branch circuit. It will remain in good action for at least twenty-four hours, and is readily and expeditiously cleaned and re-charged. This apparatus has become a favorite exploding instrument with sailors, being easily constructed and charged anywhere, and very handy for boat operations (in connection with the employment of torpedoes as an arm of attack), in which service more delicate instruments speedily lose in efficiency. Larger piles constructed on precisely the same plan are now being used in some ships of war for the simultaneous discharge of guns, and a very small form of pile, with water only as the exciting agent, is the most convenient instrument for testing the fuses and cables of torpedoes after they are in position. It is a matter of great importance that a positive knowledge of the efficiency of a torpedo and its conducting wire should be obtained from time to time by electric tests, and there is now no difficulty in including the fuses themselves in the test. Signals may, in fact, be readily passed from one firing station to another through the fuse in a submerged torpedo, which is arranged to be fired at will from the shore.

It does not come within the scope of this discourse to enter upon a discussion of numerous important

subjects connected with the actual use of electric torpedoes, or of the considerations involved in the question as to how these formidable agents of defense may be most efficiently applied, in addition to, or in the absence of, artillery defenses. The object of the discourse will have been attained if it has been satisfactorily demonstrated that electrical science is destined to contribute most invaluable to the efficiency of a country's defenses.

### Electricity in Metallurgy.

One of the tendencies of inventive skill at the present time is to supplant old mechanical appliances by new applications of nature's subtler forces, among which electricity is at once the most important and the most available. Some years ago, the experiments of Becquerel made the world familiar with the possibility of successfully treating silver and other ores by electric action, but were looked upon as of interest from a theoretical rather than from a practical point of view—the proportion of metal reduced being found to be much less than by the best amalgamating processes. Later than this, some ten years since, new attempts in the same direction were made, in which it was sought to dispense with the preliminary roasting incident to Becquerel's method. This was done by dissolving the sulphuret of silver in a solution of chloride of sodium—common salt—and bringing the liquid in communication with the positive pole of a galvanic battery—the result being that the chloride of silver formed by the combination of the silver with the chlorine of the salt was decomposed, and the metal deposited upon the negative electrode; this being greatly facilitated by the presence in the solution of copper in the form of a chloride, formed either through the addition of blue vitriol—sulphate of copper—to the liquid, or by other suitable means.

This theoretically promising method did not fulfill all the conditions requisite in the proper reduction of ores, but it was made the groundwork of much experiment by more than one ardent projector. One of the most perfect of these trials was carried on substantially as follows: The finely pulverized ore is placed in a double solution of common salt and blue vitriol, and is agitated by rotating arms or stirrers, to which were attached strips of copper extending down in contact with a layer of quicksilver in the bottom of the receptacle holding the solution. The quicksilver and consequently the copper on the stirrers was brought in connection with the negative pole of a strong battery, while the positive pole was made to connect with the copper lining of the receptacle. The receptacle being covered over, steam was admitted, and the stirrers caused to rotate, thereby throwing the particles of the sulphurets against the positive electrode, by which to be decomposed. The fallacy of this treatment of the ores lay simply in this, that the particles must not only come in contact with the electrode, but such contact must continue sufficiently long for the decomposition to occur. For this the simple stirring proved insufficient. To remedy the defect, a still later method has been patented in this country, which we thus describe:

The sulphurets in a solution of common salt are placed in a swinging vessel, which may be made of wood, and the horizontal gudgeons of which work in insulated bearings, in order to prevent the loss of electricity. The wires of the battery are made to communicate by appropriate devices with the apparatus, and provision is also made for the admission of steam. By these means a vigorous electro-lytic action is made to take place, the agitation of the pulp by the movement of the vessel being just sufficient to keep the particles in contact with the copper positive pole-plate for the requisite length of time. The decomposition

of the metal is of course upon this pole-plate, and the action of the chlorine of the salt upon the latter insures the proportion of chloride of copper essential in the operation. The process may, moreover, be hastened somewhat, when desired, by the addition of blue vitriol to the solution.

It is proposed to use the same apparatus in extracting gold from auriferous pyrites; but in this case iron or carbon must be substituted for copper in the positive electrode, and for economical reasons magneto-electro machines must be used in the place of a battery. The process thus briefly sketched promises, if successful, to mark an era in the treatment of pyritic ores, and even to those who may have no share in the industry to which it relates, must be of considerable interest for the reason that it so ingeniously combines ordinary mechanical and chemical means with the more subtle agency of the electric fluid, and also, because of the manner in which this matter of the electrical treatment of ores has been made, by successive steps, to reach a condition so strongly promising practical success.—*American Artizan*.

### Brevities.

OMAHA, JUNE 15, 1869.

EDITOR JOURNAL OF THE TELEGRAPH.

The completion of the Chicago and Rock Island Railroad gives the Western Union another wire between Chicago and Omaha, making in all four.

Material has been shipped from Omaha by river for the construction of a line from Fort Benton to Helena, Montana, distance about 160 miles.

Steps have been taken looking to connection with the United States and Mexico line running from Cheyenne via Denver to Santa Fe, N. M.

The new line built by Assistant Superintendent Conway, between Omaha and Salt Lake, works admirably, fully as well as the Chicago circuit, half its length.

Superintendent Hibbard has just returned from a trip West, where he has been looking after the interests of the Company which he so ably represents.

Business between the Atlantic and Pacific States has nearly doubled since the opening of the railway.

Omaha is filled with excursion parties from both East and West, who invariably express themselves pleased and astonished with the condition of the Union Pacific Railroad, its management, as well as with the country through which it passes. TODD.

EDITOR JOURNAL OF THE TELEGRAPH.

DEAR SIR: Noticing in your excellent paper some discussion on Self-closing Keys, I thought I would tell you my experience. I sent my key to be repaired and while off for that purpose I had to use an old key which had a weak spring. I thought it was worse than no spring, so I removed the spring, making in effect a self-closing key. It answered the purpose very well and I had no trouble about students leaving circuit open. It certainly is a sure way to close a circuit. Yours, &c., S.

TOBACCO has ruined thousands. It tends to the softening and weakening of the bones; it greatly injures the brain, the spinal marrow and the whole nervous fluid. One who in any way uses large quantities of tobacco generally lacks muscular and physical as well as mental power. We would warn young men who want to be anything in the world to shun tobacco. —*Peninsular Herald*.

## Scintillations from Scientific Authors.

BY MADISON BUELL.

When, as is constantly done in common parlance, a house is said to be *struck*, windows *broken*, metals *fused* or *dissipated* by the electrical fluid, are not the expressions used such as if not sanctioned by habit would seem absurd? In all cases of injury done by lightning there is no fluid perceptible. The so-called sulphurous odor is either ozone developed by the action of electricity in atmospheric air, or the vapor of some substance dissipated by the discharge. It seems more consonant with experience to regard these effects as produced by force, as analogous effects are produced by admitted forces in cases where no one would invoke the aid of a hypothetic fluid for explanation. Glasses may be broken by electrical discharges; so may they by sonorous vibrations; metals electrified or magnetized will emit a sound; so they will if struck, or if a musical note with which they can vibrate in unison be sounded near to them.

In all phenomenon the more closely they are investigated, the more are we convinced that, humanly speaking, neither matter nor force can be created or annihilated, and that an essential cause is unattainable. Causation is the will, Creation the act of God.

A species of voltaic pile may be formed by a series of slices of muscle, so arranged that the external part of one slice may touch the internal part of the next.

Electricity produces heat so intense that it cannot be measured, as every sort of matter is dissipated by it.

A change takes place in the temper of glass when submitted to the influence of powerful magnets.

The hypothesis of matter without weight presents in itself fatal objections to the theories of electrical fluids, which are entirely removed by viewing electricity as force and not as matter.

Science is rapidly progressing toward the establishment of immediate or direct relations between all forces. Where at present no immediate relation is established between any of them, electricity generally forms the intervening link or middle term.

The ratio which the attractive magnetic force produced bears to the electric current producing it, has been investigated by many experimentalists and mathematicians. The data are so numerous and so variable that it is difficult to arrive at definite results. The definite size of the coil and the iron, the temper or degree of hardness of the latter, its shape, or the proportions of length to diameter, the number of coils surrounding it, the conducting power of the metal of which the coils are formed, the size of the iron in which magnetism is induced, &c., complicate the experiments. The most trustworthy general relation which has been ascertained is, that the magnetic attraction is as the square of the electric force.

The ancients, when they witnessed a natural phenomenon, removed from ordinary analogies and unexplained by any mechanical action known to them, referred it to a soul, a spiritual or preternatural power; the amber and the magnet were supposed by Thales to have a soul.

An electric current appears to have a magnetic action in a direction cutting its own at right angles; or, supposing its section to be a circle, tangential to it. If then we reverse the position and make the electric current form a series of tangents to an imaginary cylinder, this cylinder should be a magnet. This is effected in practice by coiling a wire as a helix or spiral, and this to all intents and purposes a magnet. A soft iron placed within such a helix concentrates its power.

## The Aurora Borealis, or Magnetic Storm.

The brief statement which I made in the JOURNAL of the 15th of May, respecting the plan by which I successfully worked for several hours, two wires between New York and Boston, during the great auroral display on the evening of the 15th of April, has caused a good deal of discussion in certain quarters; one writer, taxing his ingenuity to prove the absurdity of the theory, and commencing with the assertion that I never made the experiment alluded to, while concluding with the singular announcement that the illustration which I made of a wire connected so as to form a loop, with a source of electricity of the same polarity attached to each end, constituted a shunt!

Mr. Pope discusses the subject more intelligently, but has inadvertently fallen into some errors which require correction. Mr. Pope says: "all electrical currents are invariably caused by a difference of electrical tension between two points, and the passage of the current, as it is termed, tends to equalize these varying tensions. Under ordinary conditions the current used in operating a telegraph wire, is caused by the difference in electrical tension between the two poles of the battery employed."

This statement is singularly inaccurate. The passage of the current has nothing to do with the difference in electrical tension between the two poles of the battery, for the tension is the same at one pole of a battery as at the other. The tension of a battery depends upon the number of cells employed, and the amount of tension required depends upon the resistance to be overcome in the circuit.

The passage of the current is due to the electric discharge which ensues on the connection of the opposite poles of a battery, and is a consequence of the union of the two electricities—the positive and negative—at either end of the battery.

The cause of earth currents, which are flowing over the lines all the time, although generally inappreciable with our ordinary apparatus, is to be found in the difference in polarity between the two places where the wire enters the earth. During an aurora borealis, or magnetic storm, as it is generally designated, these currents become very powerful, and are not unfrequently experienced simultaneously over the greater part of the earth, and are sometimes so powerful that the earth at New York has been found to be + or — to the earth at Boston, to the extent of 200 cups of Grove's battery. While working with the Bain or chemical telegraph, between New York and Boston from 1849 to 1852, I frequently knew these currents to be strong enough to burn through several sheets of the prepared paper upon which we received the dispatches.

These currents do not change suddenly, like electric signals, but go gradually over from positive to negative. I have never known an earth current to change from maximum positive to maximum negative in a shorter period than 60 seconds, and the change is often spread over an interval of several minutes.

It was to overcome these earth currents and magnetic storms that Mr. Varley invented his condenser, which is attached to the Atlantic Cable. The principle upon which the success of this device depends, is that of the gradual change of polarity of the earth currents. The cause of the difference in polarity of various sections of the earth, which gives rise to these earth currents, has been variously surmised. It is very likely due to the inductive action of the electrified clouds; and if so, not only the earth, but all that lies under the clouds, would be inductively charged by the same influence, and it does not appear clear to my mind why the auroral influence should not appear upon a metallic circuit, as well as upon one grounded, except upon the theory presented in my previous article.

During an aurora the earth at certain places being charged positively, and at other places negatively, it follows that if you extend a wire from the + point to the — point, and insert the two ends of the wire into the earth, a current will flow over the wire; but if you extend the wire from the place where the earth is — to the place where it is —, and then bring it back to the starting or + point, making no connection with the earth at the — point, but grounding both at the + point, that no current from this source will flow over the line. This is precisely what I did on the 15th of April, and for more than three hours I worked the loop between New York and Boston without the slightest trace of the auroral current, although my apparatus was so delicate that a single cup of battery would have made a distinctive record.

If Mr. Pope will read my article, he will observe that I said nothing about "the influence passing into the two wires and neutralizing itself at the loop." Under my arrangement of the wires, no influence could pass into the loop any more than a current could pass over a line, when both ends of it were connected with the same pole of a battery. It is difficult to represent by illustration the absence of a current, but I tried to show by the arrow heads in the diagram that there could be no current there, because as both ends of the wire terminated in the same source of electricity, they must necessarily repel each other.

G. B. PRESCOTT.

## Protection from Lightning.

To stand by the side of a continuous conductor, of sufficient conducting capacity to afford free transit to the electric charge, is the safest position which a person can take. A house with a good lightning-rod passing down its wall is exactly in that condition. But to be near an imperfect conductor, as a tree, for example, or to form part of a broken chain of conductors, is, on the other hand, the most dangerous. Any small metallic substance about the person, as a pair of spectacles upon the face, a ring upon the finger, or a knife in the pocket, would have no appreciable influence. And yet a novelist might, without too great a violation of probability, represent a murderer as arrested in the act of stabbing his victim by a flash of lightning striking the knife from his hand, and liberating the victim by felling the assassin himself to the ground at the instant of giving the blow.

A German writer, giving an account of curious examples of the effects of electrical discharges, states the case of a peasant girl, who, being overtaken by a thunder-shower when walking in the fields, had a golden pin, which was passed through her hair behind to keep it in its place, fused and dissipated by a stroke of lightning without herself suffering any personal injury at all.

To guard against such accidents as these—if any such accidents ever really occur—and also as a protection from the general danger of being struck with lightning to which persons are more or less exposed when out in the open air during a storm, some ingenious philosopher has jestingly proposed that a portable lightning-rod, in combination with an umbrella, should be provided for people liable to such adventures. A sportsman, then, overtaken by a thunder-storm, if equipped with such a protector—a pointed metallic rod projecting in the air from his umbrella over his head, and connected with a wire or chain to drag on ground behind—could bring himself and his traps safely along through the midst of the tempest, while the lightnings played harmlessly around him.

A bar of iron slightly curved by its own weight can be straightened by being magnetized.

## Vegetable Electromotors.

The *Chemical News* contains an article contributed by Edwin Smith, M. A., giving results of researches in a field which so far as we are aware has been hitherto untraversed. He says: It is well known that a voltaic combination may be made of two liquids and a metal, if one of the three acts chemically upon one and only one, of the other two; thus—we may employ copper, nitrate of copper, and dilute nitric acid, or platinum, potash and nitric acid. Connect a platinum crucible with one terminal of a galvanometer, pour in a little solution of caustic potash, place in this the bowl of a tobacco-pipe having the hole stopped up with wax, pour into the bowl a little nitric acid, dip in the acid a small slip of platinum foil, and connect this with the other terminal of the galvanometer; a powerful deflection of the needle indicates the presence of an electric current and shows its direction to be from the alkali to the acid, the platinum serving merely as a conductor. It occurred to me, when performing this experiment, that an electro-motive combination might just as well be made of two vegetable substances, with platinum for conductor, provided only they were of a nature to act chemically upon one another—an alkaloid and an organic acid, for instance. It also seemed to me not unlikely that, wherever two flavors are habitually conjoined in our cookery and eating, the reason why they mutually improve each other is because a certain amount of electric action is set up between the substances employed to produce them. The rationale of the right blending of flavors might be found partly, no doubt in chemistry, but partly, also in galvanism.

Pursuing this idea, I tried pairs of eatables which generally go together, such as pepper and salt, coffee and sugar, almonds and raisins, and the like, and found that a voltaic current more or less strong was excited in every instance which I tested. Bitters and sweets, pungents and salts, or bitters and acids, generally appear to furnish true voltaic couples, doubtless in consequence of the mutual action of some alkaloid salt and an acid or its equivalent. As others may like to repeat or extend the experiments, I will describe shortly my mode of procedure: Cut two pieces of platinum foil about 5 inches by 2½ inches, and a number of pieces of filter paper a trifle larger. Well washed linen is sometimes more convenient than filter paper. Have a small wooden board near the mercury cups of the galvanometer, and let a short copper or platinum wire, dipping into one of the cups, rest on the board. The substances to be tried must be brought to a state of solution, the stronger the better, by infusion, decoction, or otherwise. Suppose coffee and sugar are to be operated upon; solutions of both having been prepared, dip into each a slip of filter paper; place one slip on one of the pieces of platinum foil, and the other on the second piece. Next lay the first slip and its foil on the board, with the metal touching the copper wire before mentioned. Lay the second slip with its platinum upwards, so that the coffee and sugar come into even contact with slight pressure, and immediately connect this upper slip, through a bit of copper wire, insulated from the touch, with the other terminal of the galvanometer. Deflection occurs instantaneously, and may be increased to a considerable vibration by breaking and making circuit at the right swing of the needle. After a few distinct vibrations, it is well to turn over the whole pile of slips just as they are, and connect opposite ends with the galvanometer, so as to reverse the current. This is desirable for the sake of confirming your previous observation, and of correcting any slight disturbing cause arising from the wire and mercury connectors, temperature of the hand, etc. It will be found that coffee and sugar have the same electrical relation to each other as zinc

and platinum. Coffee, in fact, is the positive, sugar the negative element. I subjoin a table of the results of numerous experiments, conducted in the manner above described:

ELECTRO-POSITIVE.	ELECTRO-NEGATIVE.
Coffee.....	Sugar (loaf),
Tea (black).....	"
Cocoa.....	"
Nutmeg.....	"
Cloves.....	"
Cinnamon.....	"
Mace.....	"
Vanilla.....	"
Almonds.....	"
Rhubarb (tincture).....	"
Starch.....	"
Starch caramel.....	"
Gum caramel.....	"
Cane sugar caramel.....	"
Milk Sugar.....	"
Gum.....	"
Almonds.....	Raisins.
Horseradish.....	Beet root.
Onion.....	"
Horseradish.....	Table salt.
Mustard.....	"
Pepper (white).....	"
Mustard.....	Tartaric Acid.
Ginger.....	"
Cayenne Pepper.....	"
Pepper (white).....	"
Tea (black).....	"
Tobacco.....	"
Quinine (Howard's).....	"
Gentian root.....	"
Lemon juice.....	"
Horehound.....	"
Lavender water.....	"
Quassia.....	"
Peppermint.....	"
Raw potato.....	Lemon juice.
Rind of lemon.....	"
Peruvian bark.....	"
Camphor (tincture).....	"
Laudanum.....	"
Arnica (tincture).....	Dilute Sulphuric Acid.
Peruvian bark.....	"
Quinine (Howard's).....	"
Iodine (tincture).....	Turpentine.
Caustic potash.....	"
Starch.....	"
Starch.....	Iodine (tincture).
Caustic potash.....	Neat's-foot oil.

It is somewhat difficult to eliminate from these experiments all error arising from difference of temperature, if the galvanometer is tolerably sensitive. Care must be taken to bring the pair of solutions operated upon to the same temperature before testing them; otherwise a thermo-electric current from the hotter to the colder liquid may affect the needle, and mask the true electrical relation between the two so far as it depends upon their chemical nature.

LAKE SUPERIOR, Mich., June 18.

EDITOR JOURNAL OF THE TELEGRAPH:

Thinking a few items relating to the telegraph in this part of the country might be of interest to your readers, I indite the following:

The Northwestern Telegraph Company have a line extending from Green Bay, Wis., to Marquette and Houghton, Mich. This line has been built about four years, and is a very substantial and fine working line. There are thirteen offices. The following are the operators at the more important points: Green Bay, Messrs. Barclay and Harris; Menominee, John Kern; Escanaba, O. D. Sloat; Negaunee, D. F. Wadsworth; Marquette, W. S. Dalliba; Houghton, Henry Mohle. Mr. Mohle has accepted a position in Chicago and intends leaving us shortly. This line is divided into two circuits, Negaunee being the repeating office.

The Marquette and Outonagon R. R. Co. have built a line along their road from Marquette to Champion, a distance of thirty-two miles. The following are the operators: B. H. Bickwell, of Mendota, Ill.; E. Chil-

son, of Burlington, Iowa; J. B. Minick, of Lancaster, Pa.; Dan H. Bacon, of Marquette; V. J. Newman, of Philadelphia, Pa.; M. R. Hunt, of Aurora, Ill.; H. R. Taylor, of Houghton; Geo. A. Hart, of New York city; S. O. Nichols, of Burlington, Iowa, and L. D. Doty, of Belvidere, Ill. All good sound operators.

From Houghton the Mineral Range Company's lines extend North to Eagle river and West to Rockland, a distance of about sixty miles. It will be extended to Outonagon this summer. This line was built last summer and is in all respects a well built line, Mr. W. V. Stevens, the superintendent, having had personal supervision of its construction. There are ten offices on this line. With the exception of Mr. H. S. Ming, knight of the key at Calumet, the operators have learned what they know about telegraphing since the line has been built. On this account it has been facetiously dubbed the "student's line." Under the instruction of Mr. Stevens, whose ability to impart instruction in whatever pertains to the art is well known here, these gentlemen will, no doubt, make good operators in due time, but at present we can only say in the classic language of the Milwaukee gentleman who has been subbing at Houghton the past week, "They are a tuff case."

Hon. J. D. Caton, of Ottawa, Ill., has been spending a week in the Lake Superior country, returning yesterday.

RELAY.

## The Post Office Mutual Aid Association.

The clerks, carriers and others belonging to the Post Office Mutual Aid Association this month paid in \$1,134 for the family of J. J. Murray, and \$1,136 for the family of John Tallon, both of whom died last month. Each member contributes two dollars upon the death of an associate. Since the organization was formed, in December, 1867, there have been ten deaths among the members.

It would appear from the above that with a membership very little larger than that of the Telegraphers' Mutual Insurance Association, and during precisely the same period, the deaths have been 10, while those of the latter have been 8. To some who have thought our mortality too great this will show that there is another organization whose death list exceeds our own.

## Christian Courtesy.

Every man has his faults, his peculiarities. Every one of us finds himself crossed by such failings of others from hour to hour; and if he were to resent them all, or even notice all, life would be intolerable. If, for every outburst of hasty temper, and for every rudeness that wounds us in our daily path, we were to demand an apology, require an explanation, or resent it by retaliation, daily intercourse would be impossible. The very science of social life consists in that gliding tact which avoids contact with the sharp angularities of character, which does not argue about such things, which does not seek to adjust or cure them all, but covers them, as if it did not see. That microscopic distinctness in which all faults appear to captious men, who are ever blaming, dissenting, complaining, disappears in the calm gaze of love. It is this spirit which our Christian society lacks, and which we will never get till each one begins with his own heart.

SEAWEED WINE.—The *Gazette Hebdomadaire de Paris* says, that seaweed wine is preferable to all preparations of iodine, and perfectly safe in its administration in that large and often-times unmanageable class of cases understood by the term "scrofula." He found that this preparation met with the greatest success in the treatment of disease of the hip and other bones and joints in children.

# Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1897. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

## TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address— JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JULY 1, 1899.

## The Tariff.

It is easy to suppose that a Company, made up of the elements of many organizations, combining for mutual safety during and immediately succeeding a period of great civil commotion, should find its system of charges very unsystematic and somewhat chaotic. The Western Union Telegraph Company represents what was once six large dominant organizations, each of whom had, in some respects, distinct and unlike arbitrary rules, not only for their own internal tariffs, but also for the business which the nature of the service compelled them to transact with each other. In this latter class of business, tariffs had to be decided by the points of exchange which uniformity required to be designated, and which, often, by compelling messages to traverse circuitous routes, led to the imposition of excessive charges. During the war also, lines were sometimes built for special necessities, and charges were imposed—not on distance, but to compensate quickly for the cost of construction, and according to special local circumstances. Wherever lines were built to meet an excited and a possibly transitory demand, tariffs were ranged as seemed consistent with the cost of building and the possible brevity of their existence. Other tariffs were based on circuitous routes necessary to reach the point of address, since then accessible by other wires more or less direct. All these causes have contributed to the confusion and irregularity in the general charges for which a remedy has been diligently sought.

To simplify this whole department, to strip it of its perplexity, to establish a basis of tariff on air line distances, rendering the whole system uniform, compensating and just, has been the work of the past two years, and has now, after great labor, approached completion. When thoroughly established, and each office has been provided with books of tariff, many irregularities will be at once removed, and the whole department be rendered susceptible of easy control.

The first step taken in this work was the provision of a map exhibiting all the offices, and on such a scale as to render the position of each distinct. Accordingly a map measuring 9 feet wide by 19 feet long was prepared, on which was noted every office, and the route of the wire by which it was connected. This map required nearly six months to prepare, and covers the entire side of the room in which the labor of the new tariff system is being done.

Instead of calculating the tariff from every office to every other office, as formerly, which would necessitate 10,890,000 entries, the surface of the map from Cape Breton to Omaha, and including all of Texas, has been divided into squares of fifty miles, so arranged that all the squares of every alternate row will be in line with each other, while the vertical lines terminate at the centre of the squares above and below them, as in masonry. Thus the whole map is composed of a series of clusters of squares represented by the Fig. A. The whole number of

squares, as at present arranged, is 500, all numbered, the

numbers commencing at the extreme east, and running from north to south, westward. By giving a tariff from the centre of a square instead of from each office within it to any office in any other square, however distant, it reduces the entries of tariff from 10,890,000 to 1,650,000, without any complexity, and by a process more susceptible of a general just application. When the offices have been provided with the tariffs between these 500 squares, all that will be necessary when a new office is opened will be to notify all offices that an office has been opened in a certain square, and the tariff is at once known.

To provide for a smaller tariff for offices, which by their location near the edges of adjoining squares, would render the tariff too large, a circle of 25 miles radius has been drawn round each office, with a tariff of say 25 cents to or from each office within that radius; another of 50 miles, with a tariff of say 30 cents; and a third circle of 75 miles, with an appropriate tariff. These are called "local rates." In other words, the tariffs for offices not more distant than 75 miles from any office, will be determined by circles of 25, 50 and 75 miles around that office as a centre. All other tariffs are reckoned by circles, 50 miles apart, which have the centres of squares as their base.

Such is the basis of the system now about to be introduced. It is easy to see that the provision of tariff books, by this process, is made simple, and comparatively unlaborious.

The basis of tariff will be distance by air lines. The minimum distance outside of the "local rates" will be, taking for example the Eastern Division, within a radius of..... 50 miles 30 cents,

75	"	35	"
100	"	40	"
150	"	55	"
200	"	70	"
250	"	80	"

and 10 cents for each added 50 miles.

As these distances are ascertained by circles, it is evident that many squares must be intersected by more than one circle. The tariff in such case is determined for the whole of the square intersected by that circle whose line across the square is longest. For example, B is a radius

for a tariff of \$1.50, while A is a radius for a tariff of \$1.60. A having the longest line across the square will indicate the tariff for the whole square at \$1.60.

To offices beyond Omaha, west, and beyond Calais, east, rates are provided to be added to the tariff given by the squares. These tariffs when west of Salt Lake and east of Calais, are given both in gold and currency, so as to preserve entire uniformity in the charges.

All these arrangements will be regarded as the basis of the system. Departures from it will be given by special directions.

The tariff book is a neat octavo of over 200 pages, in which, in addition to the established rates between the Western Union offices is given:

1. The rates to all offices on other lines where the Western Union Company has no office.
2. Tariffs by the cables to Cuba and Europe.
3. A sheet showing the tariffs from one square to every other square.
4. The rate for additional words and directions deemed necessary for general guidance.

The system thus introduced is, we believe, chiefly the work of Gen. Marshall Lefferts, the engineer of the Company, who has devoted much time to its elaboration, and examined all the objections to its use with the closest care. In the work of its execution he has been faithfully and laboriously aided by Mr. William Holmes, who has charge of the details of the tariff bureau. For the last three months Mr. Holmes has been engaged until near midnight with a large force, entering up the details of the new tariff books, a duty most exhausting and responsible. These will soon be ready for distribution, when the labor of the department will be simplified and reduced.

The adoption of an air line tariff will of necessity greatly diminish many existing charges. Offices fifty miles apart geographically, but whose messages to each other have to pass over a circuit of twice that distance, will have, so far as cost is concerned, all the advantage of a direct line. A large number of places will be thus benefited.

One tariff, irrespective of route, will also enable the company to use any accessible wire for hastening its messages without additional charge to the sender, and without complication of checks. This will reduce the revenue on certain classes of business, but the principle of the new system being right, liberal and just, the general operation of it must be healthful and compensating.

## Henry J. Raymond.

In company with the press everywhere, and in sympathy with a sentiment of regret, wider and deeper than is felt for most men when they depart this life, we record the sudden death of Henry J. Raymond, Editor of the *New York Times*, at his home in this city, on the morning of June 18th.

No paper ever more faithfully represented its editor than the *N. Y. Times*. Dignified but not dogmatic, kind without being weak, patriotic without bluster, conservative yet progressive, truthful to present convictions at the hazard of party support, unexcitable yet ardent, with an easy and masterly command of language, both by voice and pen, a hard and careful workman, brilliant as an orator, and unsurpassed in his vocation, Mr. Raymond has passed away leaving a deep gap behind him, and universally lamented and honored. It is much to say of any public journalist what is eminently true of Mr. Raymond, that no article ever was indicted by him to wound by its bitterness, or which owed its birth to malice. Even to those he deemed the foes of his country, when his patriotism was most roused, he was ever dignified and kind, and yet urged resistance with consistent and unswerving ardor.

He has passed away from living men, leaving behind him the fragrance of a life devoted to the best interests of his country, beloved by all who knew him, and honored wherever his name was known.

At the date of our publication, probably 1000 miles of the French cable have been submerged. What was regarded as a wonderful specimen of engineering skill a few years ago now scarcely excites a remark, and the landing of the cable at St. Pierre is expected as confidently as the arrival of an ocean steamer at New York.

POPE'S MODERN PRACTICE has proved a most acceptable offering to the telegraph offices of the country, and has been universally received with expressions of commendation.

THE broken cable between Nova Scotia and Prince Edwards Island has been restored.

THE passengers on the Great Eastern will be confined to gentlemen scientifically connected with the expedition, such as Sir Daniel Gooch, Sir Samuel Canning, Mr. Varley, Sir W. Thompson, and the French directors. Upon her return, the Great Eastern proceeds to Bombay to lay the British-Indian Cable. The voyage from Brest to St. Pierre will occupy eighteen or twenty days.

FLEETWOOD HOUSE,  
BROOKHAM, KENT, 8th June, 1899.

MY DEAR SIR: I sail in the Great Eastern with the new cable, and shall hope to have the great pleasure of seeing you once more in the course of a few weeks.

Kindly remember me to all friends, and believe me to be

Yours very truly,  
C. F. VARLEY.

We shall be glad to see Mr. Varley's cheerful face among us again, and hope the Great Eastern will take good care of him during his journey hither. Has Napoleon been consulted respecting the safety of hitching imperial France to republican America? Does Mr. Varley come with his long cable to marry the Red Shirt of Paris to the Radicals of New England?

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
JUNE 2, 1869.

Notice is hereby given, that the Annual Meeting of the Stockholders of the Western Union Telegraph Company will be held at the Executive Office of the Company (145 Broadway), in the City of New York, on the second Wednesday (14th) of July, 1869, at twelve o'clock, noon, of that day.

Notice is also given, that the Board of Directors have this day declared a dividend of two dollars a share on the Capital Stock of the Company, from the earnings for the six months ending June 30th, instant, payable at the office of the Treasurer, 145 Broadway, on and after July 20th, 1869. The transfer books will be closed on the afternoon of the 21st instant, and opened on the morning of the 21st July.

Stockholders can apply for their dividends personally, or checks will be sent them upon their written request, or they can draw for the same through the banks where they do their business.

By order of the Board,  
O. H. PALMER,  
Treasurer.

### M'Kee & Lee's Railroad Signals.

Much attention seems to be given to the provision of easy and prompt modes of signaling trains for various purposes, especially for giving warning of danger or of notification of a change of orders, arresting a train passing a station where stops are not usually made, &c. We referred some time ago to the ingenious contrivance of M'Kee & Lee, of Neponset, Illinois, for this purpose, which has been adopted by the Michigan Central R. R., the Chicago & Alton R. R., the Terre Haute & Indianapolis, and other important roads, but did not then give the full attention to it which we designed. An invention which has thus secured adoption on such important roads must have merit enough in it to secure the attention of all interested in the safety of travel, and a more complete system of railroad control.

The invention is especially adapted for use on railroad lines where the telegraph operators have orders to stop trains and deliver telegrams. They are required on many roads to display signals, green flags by day and green lights by night, and to withdraw these immediately after trains have passed. This takes the operator from his post and has been found awkward and mischievous.

Messrs. M'Kee & Lee have arranged a signal box, so placed that no train can pass without the signals connected with it being seen, and which are visible from the operator's table. The signals are flags and lanterns, and are connected with cords leading to the operator, who can at once, and without leaving his table, make all the signals necessary, and himself see that they are properly made. Thus while in the act of receiving orders by telegraph affecting a train just approaching or moving off, he can detain them without stopping his work. It is always dangerous to have the operator leave his post at certain times, and he sometimes returns to find orders too late to be communicated. The value of this invention is in thus enabling him to stand by his instrument, and yet arrest the trains.

We have diagrams of these new signals in our possession, which we do not deem it necessary to publish, the whole arrangement being exceedingly simple and effective. To companies who desire to test these signals, we commend our friends, M'Kee & Lee, who can be addressed at Neponset, Illinois, and who will give all explanations which may be necessary.

### Extraordinary Phenomenon.

The Caspian Sea or Lake is dotted with numerous islands, which produce yearly a large quantity of naphtha, and it is no uncommon occurrence for fires to break out in the works, and burn for many days before they can be extinguished. Early last month, owing to some subterranean disturbances, enormous quantities of naphtha were projected from the wells and spread over the entire surface of the water, and, becoming ignited, notwithstanding every precaution, converted the sea into the semblance of a gigantic flaming punch bowl, many thousands

of square miles in extent. The fire burnt itself out in about forty-eight hours, leaving the surface of the water strewn with the dead bodies of innumerable fishes. Herodotus mentions a tradition that the same phenomenon was once before observed by the tribes inhabiting the shores of the Caspian Sea, which exerts an area that of England and Scotland together.—*Chem. News.*

### Electric Light Apparatus.

Some time since we were written to, inquiring where machinery for the production of the electric light could be procured, but not having information at hand we neglected to reply. We suppose any of our electric machinists can supply this apparatus. The Messrs. Chester, especially, have devoted much time and care upon this subject, and they would be the most likely to supply the mechanism necessary, and at reasonable rates.

To give some idea of the cost of such apparatus, however, we note that Messrs. E. G. Wood & Co., opticians, Cheapside, London, supply a complete apparatus for the purpose, consisting of the self-acting electric lamp, a powerful mirror and colored glass for throwing rays of different colored lights, and six cells of Grove battery, for £3.10, or not far from \$25 currency. The apparatus is in a neat portable case, and of fine finish.

ONLY a section of five miles in length remains to be cut, before the waters of the Mediterranean mingle with those of the Red Sea; in excavating which, twelve thousand laborers and artisans are daily employed.

It appears certain, therefore, that the canal will be opened on the day fixed by M. de Lesseps, viz., on the 1st of October next. The new ports and towns on the route are rapidly increasing in importance, even before success is certain; one of the most interesting being the town of Ismailia, built on the shores of Lake Timsah, which at present covers an area of six miles, entirely filled with the waters of the Mediterranean.

MR. GEORGE B. PRESCOTT has been withdrawn from the superintendency of the Sixth District, Eastern Division, to the performance of duties in connection with the executive department of the Western Union Telegraph Co., 145 Broadway, N. Y. Mr. Prescott has made himself exceedingly useful to the Company by enlarged and exact knowledge of telegraphic statistics and history, and his new sphere will be much more congenial to his tastes and habits.

THE insurance paid on the French Atlantic cable is 4 per cent. The rates on the old Atlantic cables were 20 per cent.

"ARCHIMEDES, of Syracuse, declared that, if they would give him a fulcrum and a sufficiently long lever, he would move the world, but, not knowing its weight, as we do now, he could not have formed a very clear idea of the magnitude of the task. Supposing that he got his lever planted, and of sufficient length to be moved by exerting upon it a pulling force of thirty pounds. Had he moved it through ten thousand feet per hour, for ten hours a day, the remote end of the lever would have to pass through an arc which it would take 8 trillions, 774 billions, 994 millions, 574 thousands, 737 of centuries to accomplish, in order to raise the earth a single inch."—*Appletons' Journal.*

If a leaden bullet hits a man, what striking metamorphosis takes place?—The leaden bullet becomes felt.

### Married.

April 24th, 1869, in Trenton, N. J., by Franklin S. Mills, Esq., Jesse R. Mills, of B. & B. Philadelphia office, to Miss Hattie Pettit, of Trenton, N. J. No cards.

Monday noon, June 14, 1869, at the Charleston Hotel, by the Rev. J. D. Onins, Monroe C. Hamlin, Manager W. U. telegraph office, Charleston, Ill., and Miss Amy P. Whittlesey, of Evansville, Ind.

### UNPARALLELED SUCCESS.

THE FIRST EDITION DISPOSED OF IN FOUR WEEKS.  
SECOND EDITION NOW READY.

THE STANDARD AMERICAN WORK ON THE TELEGRAPH.

MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

1 Vol., 8vo.

PROFUSELY ILLUSTRATED.

BY FRANK L. POPE.

This book supplies what has long been recognized as the great desideratum in American Telegraphic Literature. It is a

THOROUGHLY PRACTICAL TREATISE,

and should be in the hands of every Electrician, Superintendent, Operator, Line Builder, Repairer and Batteryman. It contains full descriptions and explanations of all the

MODERN IMPROVEMENTS IN TELEGRAPHY, which stood the test of actual experience. The work also contains the new system of

TESTING BY MEASUREMENT,

which has been employed with great success upon the Atlantic and other cables, and more recently upon land lines.

The Appendix contains a large amount of useful and practical information, formulas, tables, &c., which have never before been brought together in a convenient and accessible form. The work has been freely illustrated, wherever required, with

ELEGANT ENGRAVINGS,

most of which have been engraved expressly for its pages by the best artists.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

Prof. S. F. B. MORSE writes:

"I have had time only cursorily to examine its contents, but this examination has resulted in great gratification, especially at the fairness and unprejudiced tone of your whole work."

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."

Gen. ANSON STAGER, General Superintendent of the Central Division of the Western Union Lines, writes:

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed. A familiarity with its pages will, I have no doubt, render your work standard authority among practical telegraphers in this country on all matters concerning the Electric Telegraph of the present day."

Many other highly complimentary letters have been received from Mr. J. VAN HORN, General Superintendent of the Southern Division, Western Union Co., and others, which want of space prevents publishing.

WHAT THE PRESS SAYS OF IT.

(From the N. Y. Herald.)

"This is an admirable work. \* \* \* We know of no other work of the kind so well adapted as this is to all who desire to become intimately acquainted with the wonderful science of the Electric Telegraph."

(From the N. Y. Sun.)

"\* \* \* An excellent work by FRANK L. POPE, a gentleman whose long experience fully qualifies him for the duty he has performed. \* \* \* The book will be exceedingly valuable to all who are studying electrical science and the art of telegraphing."

*Packard's Monthly* says his book is full of that kind of information most prized by practical operators, and will find its legitimate place in the working offices.

The work has been very generally and favorably noticed by the press.

Notwithstanding the great expense incurred in the publication of this work, it is offered at the very low price of

\$1.50.

On receipt of the price of the book, it will, if desired, be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Orders should in all cases be accompanied by the money, to insure prompt attention, and if sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to FRANK L. POPE, Box 6138, or to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, OR

RUSSELL BROTHERS,

PUBLISHERS,

28, 30, 32 Centre Street.

The work may also be had of the following, who will keep it on hand and for sale:

D. Van Nostrand, 23 Warren and 27 Murray streets; L. G. Tilton & Co., 11 Dey street; C. T. & J. N. Chester, 104 Centre street; Chester, Partridge & Co., 38 South Fourth street, Philadelphia, Pa.; W. H. Young, Washington, D. C.; Charles Williams Jr., 109 Court street, Boston, Mass.; S. C. Rice, W. U. Telegraph Office, Albany, N. Y.; C. W. Northrup, A. & P. Telegraph Office, Rhinebeck, N. Y.; Bliss, Tilton & Co., 171 South Clark street, and L. C. Springer, 162 South Water street, Chicago, Ill.; A. I. Gardner, Greenacres, Ind.; Frank Lehmer, W. U. Telegraph Office, Omaha, Neb.; S. E. French, C. & N. W. R. R., Chicago, Ill.; Lundberg, & Marwedel, San Francisco, Cal.; B. Valentine, N. W. Tel. Co., Milwaukee, Wis.; J. J. G. Riley, B. & B. Tel. office; H. Craig, B. & O. R. Tel., Camden Station, Baltimore, Md.; G. A. Hamilton, P. & A. Tel. Company, Pittsburgh, Pa.; W. H. Woodring, St. Joseph, Mo.; C. H. Sewall, Franklin Tel. office, Boston, Mass.; Chas. E. Higden, W. U. Tel. office, and W. I. McClure, P. & A. Tel. office, Burnett House, Cincinnati, Ohio; Geo. L. Walker, T. P. and N. R. R., Peoria, Ill.; L. Pracet Archibald, W. U. Tel., Truro, Nova Scotia; M. D. Buckwell, B. & L. Tel. office, Philadelphia.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York.  
JULY 1, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since June 15, the date of the last tariff order. Please note them in your tariff book:

## NEW OFFICES.

Bergen City, N. J., tariff same as Jersey City, N. J.  
Cranford, N. J., re-opened, tariff same as heretofore.  
Killawog, N. Y., tariff same as Marathon, N. Y.  
Oldtown, Me., tariff 10c. more than Bangor, Me.  
Port Crane, N. Y., tariff same as Harpersville, N. Y.

## SUMMER OFFICES.

Berkeley Springs, W. Va., tariff same as heretofore.  
Catakill Mountain House, N. Y., tariff same as heretofore.  
Lake Mahopac, N. Y., tariff same as heretofore.

## NEW OFFICES ON OTHER LINES.

Deal, N. J., 20 and 2 from Long Branch. Check Long Branch.  
Mahanoy Station, Pa., 45 and 4 from Danville. Check Danville.  
Ransch Gap, Pa., 35 and 3 from Philadelphia or Harrisburg.  
Check by cheapest route.

Rock Haven, Ky., 50 and 5 from Louisville. Check Louisville.

## OFFICES CLOSED.

Belair, Md., mail business hereafter at Baltimore, Md.  
Holmes' Hole, Mass., business will now be delivered from New Bedford, Mass. Charges 25c.

Ware, Mass., business will now be delivered from West Brookfield, Mass. Charges 25c.

## TO OFFICES "HAVING SPECIAL SECRET A."

Hereafter rate to Crown Point, Ind., will be same as "special rate" to Chicago, Ill.

## GENERAL INFORMATION.

Rate to points in Prince Edwards Island will hereafter be 1.20 and 8 in gold, or 1.70 and 11 currency from Sackville, N. B.

WILLIAM OSTON, President.

## Base Ball in Hoboken.

## HERALD VS. TELEGRAPHERS.

A game between the employees of the New York Herald and the operators of the Western Union Telegraph Company was played at Hoboken yesterday. The Telegraphers far exceeded the Herald boys in batting. The following is the score:

HERALD.				TELEGRAPHERS.			
	O.	R.			O.	R.	
Anderson, 3d b.....	3	2		F. H. Selbert, 1st b.....	2	5	
Adams, p.....	3	3		Blanchard, 3d b.....	5	3	
Fitzpatrick, s.....	2	2		H. P. Jones, c. f.....	4	3	
Atwood, 1st b.....	5	0		Glover, p.....	1	6	
Kelly, c.....	2	3		Morrell, r. f.....	6	1	
Gritton, 2d b.....	1	2		Maxwell, l. f.....	1	6	
Weber, l. f.....	3	0		Landy, s. s.....	3	5	
Wallace, c. f.....	3	0		Taaffe, c.....	0	8	
McKenzie, r. f.....	5	0		W. G. Jones, 2d b.....	5	3	
Total.....	27	12		Total.....	27	40	
INNINGS.							
Herald.....	1	2	3	4	5	6	7 8 9
Telegraphers.....	2	1	0	0	0	0	2 2 5-12
J. F. Murphy, of Eckford, Jr., of New York, umpire.	2	2	1	2	8	6	13 3 3-40

Home runs were made by Maxwell, Glover and Taaffe. Fly catches and double plays were made in fine style by the telegraphers, who seemed as much at home ball playing as at the key.

At the close of the game the defeated Heralders behaved handsomely, and all parties met and had a good time together, returning to the city much pleased with the sport, at a pretty late hour. There was a large attendance of telegraphers, and all enjoyed the game as well as the afterpart, of which we have no particulars.

This was the first game of the season, but will not be the last. Several other games are in prospect, of which we will give due account.

## Telegraphers' Mutual Life Insurance Association.

## ASSESSMENT NO. 8.—ASSESSMENTS RECEIVED.

Samuel J. Smith,	James D. Reid,
R. C. Humphreys,	E. F. Ludwig,
R. G. Warth,	D. J. Ludwig,
Robert N. Norton,	L. Maury, Nos. 7 & 8,
Robert Cunningham,	J. U. Ansley,
N. H. Browne, Assess. 7,	W. C. Havens,
James P. Cassidy,	Joseph Beach,
A. J. Lombard,	W. O. Lewis,
Benj. Clark,	James Farrell.

## Telegraphers' Insurance Association.

On June 23d, the death of — Anderson, of Memphis, was announced, and a call made for funds for his family, but up to the announcement of his death no application had been received for his insurance, and, from information since received, it would have been declined. The application was received on the morning of June 24.

Hereafter an application must show age, name, address, general health, and if the party has any hereditary or incurable disease, present condition of health, present occupation, how long been engaged in telegraphing, and for whose benefit insured. The application must be approved by some superintendent or manager known to the executive committee. In all cases the full name and address is required.

We take this opportunity to request as much promptitude as possible in remitting assessments. Where it is desired, money may be remitted in advance for other assessments and credit given.

GREAT BRITAIN finds that the purchase of the British telegraph lines will cost her the snug sum of forty-five millions of dollars, this, too, in a territory little larger than the State of New York. We see that Mr. Reuter puts in his little claim at the modest sum of three millions six hundred thousand dollars.

Among the passengers for Europe by the Cuba, on the 23d ult., was Major Perry McD. Collins, the projector of the Russo-American Telegraph line. In 1855 Major Collins conceived the idea of uniting Europe and America with a telegraph by way of Asia. Several years later he concluded contracts with the Russian Government and with the Western Union Telegraph Company for the construction of the line, which was begun, but abandoned on the successful laying of the Atlantic cable. Since then he has been patiently working for a renewal of the enterprise, and is now in a fair way for success. He proposes to cross the Pacific by a series of submarine cables from our western coast to Eastern Asia, following the line of the Aleutian and Kurile Islands, and from Japan to China and Siberia. The Western Union extension is completed to within 260 miles of Sitka, and can be carried to that point in a few weeks. On the Asiatic side the Russian line is finished to Posyet, Eastern Siberia, within 300 miles of Hakodadi, Japan, and 2,700 miles from Sitka. Thus, a telegraph line of less than 3,000 miles is needed to complete the electric circuit of the world. The longest cable on the route proposed is 600 miles, between Sitka and Kodiak; and the other cables will be from 50 to 400 miles long. From Hakodadi land lines are proposed to be extended through Japan, and cables to Posyet and Shanghai, the former connecting with the Russian system, and the latter with the Chinese telegraphic cable, which the East India Telegraph Company is preparing to lay down.

Major Collins is now on his way to London and St. Petersburg, to negotiate for cables and arrange for the preliminary work. Government ships have been promised to make soundings along the ocean route, and assist in laying the cables.—N. Y. Sun.

In a report on the Edinburgh Observatory, it is stated by Professor Piazzi Smyth, that, in trying some mechanical means of ventilation for carrying off from the top of a room the effluvia of gaslights, there were obtained five pounds of water so acid as at once to redden litmus paper, by the constant burning of one gaslight for a week; a result completely explaining, it is considered, the circumstances of the corroding and falling off of the covers of books in the Observatory.

## The Magnesium Light.

Great expectations were raised with reference to this light as soon as a method was discovered for the cheap preparation of the metal. When magnesium is burned it emits a light quite unendurable to the naked eye, and it only remains to consider the most economical manner in which the combustion can be carried on. When the pure metal is employed it gives rise to a voluminous white cloud of the oxyd of magnesium, that obscures the reflectors and eventually fills the room where it is burned.

Various attempts have been made to absorb this vapor, and thus remedy the difficulty. By alloying the magnesium with zinc the quantity of light is not diminished, and the fumes are more readily removed. An alloy with the new metal, thallium, has been very successfully tried. A lamp has been patented for burning finely divided magnesium mixed with sand, and made to pass through an hour-glass arrangement on to a small flame. The mixed sand and metal are then fed regularly into the flame, and the light emitted is very intense. In other lamps the magnesium, in the form of wire or ribbon, is unrolled from a reel and fed into the flame.

## A New Cement for Bottles.

Chemists and others know well the difficulty of keeping very volatile liquids. Bottles of ether, for example, are shipped for India, and when they arrive are found to be more than half empty. The chemist sometimes puts a bottle of benzole or bisulphide of carbon on his shelves, and when he next requires it he finds the bottle empty and dry. The remedy with exporters is a luting of melted sulphur, which is difficult to apply and hard to remove. A new cement, therefore, which is easily prepared and applied, and which is said to prevent the escape of the most volatile liquids, will be useful information to many. It is composed simply of very finely ground litharge and concentrated glycerine, and it is merely painted around the cork or stopper. It quickly dries and becomes extremely hard, but can be easily scraped off with a knife, when it is necessary to open the bottle.—American Artisan.

AN OLD RHYME.—There is an old superstitious rhyme, whereof I have seen several versions, concerning the result of being born on a certain day of the week. It is something of this sort:

Monday's child is fair of face,  
Tuesday's child is full of grace,  
Wednesday's child has toil and woe,  
Thursday's child has far to go,  
Friday's child is loving and giving,  
Saturday's child works hard for his living,  
And the child that's born on the Sabbath day  
Is happy and lucky and wise and gay.

Here are a few tests. Byron was born on a Tuesday; so was Napoleon I; Napoleon II (M. Rochefort's ideal Emperor) on a Wednesday; Napoleon III also on a Wednesday; Pope Pius IX on a Sunday; Garibaldi on a Wednesday; Bismarck on a Friday (the 1st of April); the unhappy Emperor Maximilian also on a Friday; his Empress on Sunday; Mr. Gladstone on a Friday, and Mr. Disraeli on a Saturday.—Notes and Queries.

THERE is far more sunshine than cloud in the world, and the blue sky oftener bends lovingly down than does the threatening black. Nature grows flowers everywhere, alike in the untrodden and unseen wilds, and in the garden of the florist. Our years of happiness—or what should be such—far outnumber those of sorrow, and the heart beats responses of joy a thousand times where it beats to sadness once. It is well to think of these things. The tendency of mankind is to take short, imperfect, false views of its surroundings. We get everything, deserve nothing, and grumble pretty much all the time.

**A Wheelocipede.**

It has only one wheel,  
 Neither treadle nor saddle;  
 It is built in such shape  
 That you don't have to straddle.  
 The man who propels it  
 Takes hold with his hands  
 Of two parallel bars,  
 And on the ground stands;  
 Puts his feet in motion,  
 One after the other,  
 While the vehicle goes,  
 Without any bother.  
 This funny machine  
 Has no painting or gilding;  
 It is useful to carry  
 Material for building—  
 Shingles and shavings,  
 Brick, lime and plaster—  
 And the lighter the load,  
 It can travel the faster.  
 It is better than a bicycle,  
 For it isn't so narrow;  
 And our wheelocipede  
 We will call a wheel-barrow!

**Deep Sea Soundings.**

At a meeting of the New York Association for the Advancement of Science and Art, held June 14, Mr. Livingston Morse exhibited his recently invented device for taking deep sea soundings without the inconvenience and delay incident to the use of ordinary sounding lines. The apparatus is termed a "bathometer," and consists in a hollow cylinder of wood or sheet metal containing a number of hollow glass spheres, which, being filled with air, constitute the floats by which the device is caused to return to the surface of the water after its descent to the bottom. The cylinder is ballasted in such a way that it will maintain an upright position in the water, and has a detachable weight affixed to its lower end. When dropped overboard, the weight carries the apparatus to the bottom, whereupon, by an automatic contrivance, the weight is detached and the cylinder rises to the surface. The time of ascent and descent being about equal, and the rapidity of movement being ascertained by previous experiment, the period of submersion is a tolerably accurate index of the depth. The inventor, however, does not intend to rely upon this, but has provided the apparatus with a peculiar registering device by which the pressure of the water, and consequently the depth, is accurately recorded. The instrument is furthermore so contrived as to bring up a specimen of the bottom of the sea at the point where it struck.

**THE LOVE OF THE BEAUTIFUL.**—Place a young girl under the care of a kind-hearted, graceful woman, and she unconsciously to herself grows into a graceful lady. Place a boy in the establishment of a thorough-going, straight-forward business man, and the boy becomes a self-reliant, practical business man. Children are susceptible creatures, and circumstances, scenes and actions always impress them. As you influence them, not by arbitrary rules, not by stern example alone, but in the thousand other ways that speak through beautiful forms, through bright scenes, soft utterance and pretty pictures, so will they grow. Teach your children then to love the beautiful. Give them a corner in the garden for flowers, encourage them to put in shape the hanging baskets, allow them to have their favorite trees, lead them to wander in the prettiest woodlets, show them where they can best view the sunset, rouse them in the morning, not with the stern "time to work," but with the enthusiastic "see the beautiful sunrise;" buy for them pretty pictures and encourage them to decorate their rooms, each in his or her childish way. The instinct is in them.

**Handsome Present.**

Yesterday a committee of telegraph operators on the Central Railroad of New Jersey, on behalf of their associates, presented to James L. Mingle, Esq., their former Superintendent, a splendid solid walnut counting house desk as a token of their esteem. The desk is most beautifully gotten up, is amply provided with drawers, shelves and pigeon holes, and was made with a special view to convenience by a leading cabinet maker in New York. Just above the recess, in front of the desk, is attached a large and very handsome silver medal, on which is engraved the following inscription:

**JAMES L. MINGLE:** Please accept this gift from the undersigned, operators on this line, as a mark of their appreciation of services rendered and favors extended to us all while you had charge of the Telegraphic Department on the Central Railroad of New Jersey:

J. H. Johnson,  
 C. H. Walton,  
 P. Mixsell,  
 F. Gordon,  
 J. B. Hunt,  
 S. H. Garis,  
 J. Silver,  
 E. S. Russell,  
 J. M. Shannon,  
 S. S. Bogart,  
 G. H. Frech,  
 A. M. Smith,  
 W. T. Swem,  
 A. Nelson,

E. L. Flint,  
 J. H. Frech,  
 J. C. Hamman,  
 T. E. Quin,  
 J. K. Sheppard,  
 C. R. Norman,  
 G. W. Harrison,  
 W. H. Hagenbuch,  
 C. L. Suydam,  
 J. H. Kruesen,  
 C. H. Vogel,  
 K. S. V. Randolph,  
 W. F. Goundle,  
 J. M. Odenwelder,

J. J. Cyphers.

JUNE 1st, 1869.

The following is a copy of Mr. Mingle's letter of acknowledgment:

EASTON, June 15, 1869.

Messrs. Bogart, Quin, Suydam and others.

GENTLEMEN: The handsome desk you have been pleased to bestow upon me, as a testimonial of your regard, is gratefully accepted. Its beautiful workmanship is the admiration of all to whom I have exhibited it; but whilst I highly prize it for its beauty and usefulness, I value it chiefly as an evidence of the good feeling you retain for me after my retirement from the control of the line upon which you are employed. I shall ever bear in affectionate remembrance this expression of the pleasant relations that had grown up between us, and shall be pleased at all times to bear testimony to the confidence and esteem inspired by your professional skill and personal worth.

Respectfully,

JAS. L. MINGLE.

**DURANT'S****NONPAREIL RELAY,**

A PRACTICAL

**SELF-ADJUSTING RELAY**

ON ALL ORDINARY CIRCUITS.

Price, \$30.

Mr. GEORGE E. SEIBERT, Western Union operator, 145 Broadway, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a Self-adjuster in every respect."

For a full description of the construction and advantages of this instrument see Journal of the Telegraph of December 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office Order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,  
 Office and Factory 86 Nassau St.,  
 New York City.

Agent for the sale of the Nonpareil Relay on the Pacific Coast,  
 MR. STEPHEN D. FIELD,

San Francisco, Cal.

**CHESTER, PARTRICK & CO.,**

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH,

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**IMPROVED TELEGRAPH WIRE.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

**THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Or Agents of the Company.

**Ney's Battery.**

This cheap and convenient battery is constructed as follows: It consists, in the first place, of a glass vessel, filled with a solution of sal-ammoniac; then of an amalgamated zinc plate, which dips into the vessel. Further, of a porous cylinder of clay, standing in the same vessel, and filled with carbonate of copper, in which a plate of copper is suspended. For field and telegraph purposes, it is well to fill the glass vessel with fine sand, saturated with sal-ammoniac solution, instead of the pure solution itself. It is only necessary to add the crystal sal-ammoniac from time to time, in order to keep this battery in constant activity. The carbonate of copper is itself insoluble in the sal-ammoniac solution; but under the influence of the galvanic current, the sal-ammoniac is separated into the hydro-chloric acid and ammonia, the first of which attaches itself to the zinc, and the latter to the salt of copper, and dissolves it. During the reduction, a secondary current is produced, which is equivalent in strength to that of a Daniels' battery.

**SHAWK & BARTON,**

Manufacturers of  
ELECTRICAL INSTRUMENTS,  
And Dealers in  
TELEGRAPH SUPPLIES.

Having purchased the Stock and Tools of the Western Union Company's Cleveland Shop, will manufacture to order and keep on hand all articles of Telegraph Machinery and Supplies.

Line Wire,	Salts,	Lightning Arresters,
Office Wire,	Mercury,	Lightning Rods,
Insulators,	Relays,	Induction Coils,
Jars,	Registers,	Tissue Paper,
Porous Cups,	Keys,	Carbonized Paper,
Tumblers,	Sounders,	Clips,
Zincs,	Repeaters,	Electro-platers' Materials,
Acids,	Switches,	Philosophical Apparatus,
&c.,	&c.	&c.

We continue to manufacture Instruments after the favorite

**WESTERN UNION STANDARD PATTERNS,**

and shall keep up with the times in all valuable improvements.

Customers can obtain at our depot a

**COMPLETE OUTFIT OF ELECTRICAL APPARATUS,**

embracing such instruments of other manufacturers as are good and serviceable.

We are prepared to take contracts on liberal terms for the construction and equipment of

**TELEGRAPH LINES**

of any required length, in any part of the United States, for individuals or for corporations.

E. M. BARTON.

**STICKWELL & CO'S**

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

**STICKWELL'S MUCILAGE?**

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the piece. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 80Z. CONE, 80Z. FLAT, 30Z. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES,

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifty* hundred, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 146 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## Journal of the Telegraph.

### A Valuable Scientific Museum Destroyed.

The St. Louis Academy of Science has recently suffered the loss by fire of its valuable collection of books, pamphlets, maps, etc. The museum contained six hundred specimens of marine shells, donated by the Smithsonian Institute, and was unusually rich in crania, skeletons of birds, and reptiles, together with Dr. Pope's mounted skeletons of mammals, purchased in Europe and transported at great expense; also about 1,200 specimens of minerals, embracing a full suit of Missouri minerals and ores. There were also an extensive collection of the bones and teeth of extinct animals, and fossil turtles collected from the Mauvais Terre, Dakota, by Prof. Hayden; also, the collection of rocks, illustrating various geological periods, amounting to four or five hundred specimens, including those collected by Dr. Wizenus during Colonel Doniphan's expedition to New Mexico.

Beside the above, there were any quantity of Indian relics and curiosities, including a birch bark canoe; also the specimens of porcelain, collected from a porcelain tower blown up by the China rebels, and presented to the Academy by Lient. Clarke, United States Navy. All were destroyed, a loss which is irreparable.

### Curious Electric Shock—Lightning Lying Around Loose.

On Monday afternoon, Mr. D. A. Griffin, of this city, received a pretty severe electric shock in this wise: On the afternoon in question he, in company with Mr. A. Richardson, was engaged in putting up a lightning rod on Mr. Burne's house, some seven miles south from this city. The tip of the rod being a little loose, Mr. Griffin applied his pincers to the wire to tighten it, when there was an instantaneous explosion of electricity, with some four or five sharp reports, following each other in rapid succession. Mr. Griffin was knocked down, falling on the roof, but luckily had sufficient strength and consciousness to throw his hands over the peak of the roof and maintain his position until help reached him. A short time previous to the explosion, a moderate thunder storm had passed over the locality, but at the time of the shock, the clouds had nearly or quite passed away, and no signs of the presence of electricity were visible. The connections of the rod with the earth had not been completed at the time of the shock, and the moment the steel pincers came in contact with the rod the electric current was attracted, with the results above named. Mr. Griffin, we believe, has entirely recovered from the effects of the shock.—*Rochester (Minn.) Post.*

TYPE-SETTERS should be careful to dip their fingers into the right boxes. Out West an editor has been sued for libel, in having published that a certain Mr. Harrison was a well-known house-breaker. The defense of the editor is that he wrote horse-breaker, which the plaintiff is by occupation.

A GENTLEMAN of Rochester saw an advertisement that a cure for dyspepsia might be had by sending a postage stamp to the advertiser. He sent his stamp and the answer was, "Dig in your garden, and let whisky alone."

"Jim," said one youngster to another on the Fourth; "Jim, lend me two cents, will yer? I got up so early that I spent all my money before breakfast. I didn't think the day was going to be so long."

SOME people have singular ideas of perfect happiness. An industrious Scotchman who resided near New York for a quarter of a century, and who had accumulated a very handsome property, recently sent to the "auld countrie" for his father, with the view that he should share his prosperity, and slip away from his lease of life as smoothly as possible. One day a friend of the family paid a visit to the elegant mansion on the Hudson, where the old gentleman was living with his son, and took occasion to compliment the proprietor of the estate on its surpassing loveliness and cosy comfort. The owner, full of love for his beautiful home, said he looked upon it and its surroundings as "a perfect heaven on earth." "Heaven on earth!" growled the venerable Scot—"heaven on earth, and no' a thimblefu' o' whuskey in the heill hoose!"

### SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK.

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York.

The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

Keeps constantly on hand and for sale his

IMPROVED TELEGRAPH INSTRUMENTS,

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.

His Relays were awarded

**THE FIRST PREMIUM**

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the helix, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

**PRICES.**

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections of the above.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill O. C. D. Or, to save expense of returning funds by express, remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has special facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers prices.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS.

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET, PHILADELPHIA.

The guarantees of this insulator are:

1st. A current resistance in rain or fog, or in rain and fog combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protective to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

## HUGH ALLAN,

President of the Montreal Telegraph Company,  
Montreal.

BY JNO. HOEN, JR.

Every nation has its history. Its wealth, power, administration, productions, moral status and influence, are scanned and estimated by sister nations, and has its place assigned it in the forces of the world. But nothing in the history of any nation has ever commanded more attention than the lives of men who, by their genius or industry, have so impressed themselves on the national life as to be themselves the nation, the illustration of its vigor, and the sources of its power. So marked is this often, that sometimes a great nation may be completely and faithfully epitomized in a single name. In speaking of England the names of Bright, Cobden, Cunard, spring instinctively to the lips. In America, Stewart, Field, Grinnell. Ranking equally with all these in point of merit and positive influence, we point to Hugh Allan, of the Dominion of Canada, and offer a brief biography of this enterprising and influential man.

Hugh Allan was born at Saltcoats, County of Ayr, Scotland, on the 29th of September, 1810. He comes of a sea-faring race. His father, Capt. Alexander Allan, was a ship-master, who, for 30 years, traded between the Clyde and Montreal. Like the majority of the youth of Scotland, Hugh started early in the race of life. He left school when 13 years of age, and, like a duck, took naturally to the water. In this he obeyed the instincts of his family. His father's desires were his own as to his ultimate avocations in life. Hugh was accordingly placed in a shipping office in Greenock that he might obtain some insight into mercantile matters, more especially those relating to ships. He remained one year in this office, and then made several trips with his father, thus enlarging his knowledge and enabling him to acquire somewhat of the practice, as he had already obtained the theory, of navigation.

The study of ships, however, was only an introduction to the condition of ship-owner. Neither he nor his father deemed it sufficient that he should know only how to sail a ship, he was determined to find out how to build one. He soon therefore became absorbed in naval architecture and the practical modes of ship building. To lay a broader basis for the future, it was agreed by both father and son that a larger knowledge of general trade was essential to enlarged success, and it was determined between them that Hugh should leave Scotland and seek for a situation in Canada.

His first step in the successful career which has since followed him, was taken in the dry goods house of Wm. Kerr & Co., Montreal.

His engagement with this firm completed, he revisited his native land, after a somewhat extended tour through the United States. It need scarcely be remarked that he travelled with his eyes open, and,

having seen, remembered what he saw. After a year's absence he returned, and became a clerk in the house of Jas. Miller & Co., who, in addition to being commission merchants, were owners and builders of ships. In the course of four years, by his strong native talent and industry, he worked himself up to a junior partnership, and subsequently into a full partnership in this house, under the title of Edmonstone, Allan & Co. Not long after this, another change in the firm took place, and it became, as it now remains, Hugh and Andrew Allan.

In 1837-38, during the Canadian Revolutionary troubles, Mr. Allan determined to identify himself with the fortunes of his country, and laying aside

mercantile pursuits, served as a volunteer, and ultimately obtained a Captain's command.

In 1841, the troubles having subsided, his attention was called to the fact that a different class of ships was much needed between Montreal and Glasgow.

His theoretical information obtained in the counting-house at Greenock, and enlarged by his first experience in Montreal, together with his practical knowledge gained while sailing with his father, enabled him at this juncture to foresee that "tide in the affairs of men, which, taken at the flood, leads on to fortune," and having taken it at the right time, has made him, as he is at this moment, the most prominent man in the commercial circles of the Canadas.

In 1851 it became evident to many thinking minds in Canada that screw steamers could be successfully and profitably employed in the mail and passenger service between Liverpool and the St. Lawrence. Mr. Allan, it may be presumed, weighed well the matter in his own mind, and while trying, without success, to obtain a subsidy for carrying the mails from the

Canadian Government, put the project to the test, and with the assistance of his brothers, constructed two screw steamers for the St. Lawrence River. No sooner were these steamers completed than they were chartered by the English Government for service in the Black Sea during the Crimean war, the owners realizing no small gain by the arrangement.

Prior to building these steamers, the contract for ocean mail service was given to a Glasgow firm, which they did not keep. Their failure proved to be Allan's success. He had now a strong case to offer to the Government, when the new contract subsequently came up, for, with the advantage of having steamers built expressly for the service, he was enabled to point to the failure of the former contractors with such emphasis that the Government entered into an engagement with him as representative of a company, which service we believe has been faithfully performed to the present day.

In 1856 a fortnightly service with four steamers was commenced, and in the Spring of 1859 a weekly communication was established, which has ever since been continued.

The words "Allan's Line" has become a household word, and are synonymous with "Cunard."

The success of "Allan's Line" has not been without the loss of a number of fine steamers and many valuable lives. The pecuniary losses which these calamities have involved was enough to have discouraged a less resolute man than the subject of this sketch.

In January, 1852, 17 years ago, Mr. Allan was elected President of the Montreal Telegraph Co., and of which he was one of the original promoters. The lines of this important company extend throughout the whole of the settled portion of the Dominion of Canada, and are steadily increasing, and are connected at various points with the vast net work of lines of the Western Union Telegraph Co.

Mr. Allan is also an original shareholder in the Atlantic Telegraph Co., and for some years past has been one of its directors. He has always urged the propriety of low tariffs, having found by experience over the Canadian lines that low rates pay best, so long as the wires are not overcrowded. Mr. Allan's faith in the success of this work has never been shaken, and the hopes that he formed when the old cable was about to be laid have long ago ended in full fruition.

He is also largely interested in the Western Union Telegraph Co.

There are few enterprises which have originated in the City of Montreal, or are carried on in connection with it, in which Mr. Allan is not engaged.

In addition to being the principal owner and manager of a line composed of 19 first-class steamships and 25 sailing ships of large tonnage, he is President of the Merchants' Bank of Canada, which has an authorized capital of six millions of dollars. President of the Canadian Navigation Company whose 13 steamers run from Toronto, Hamilton and Lewiston on Lake Ontario to Montreal, and from Quebec to the Saginaw River. President of the Lake Memphremagog Navi-

gation Company. President of the Mulgrave Gold Mining Company. President of Montreal Warehousing Company. President of the Vermont and Canada Marble Company. President of a Building Society, and a shareholder and director in numerous other companies and enterprises. He also has extensive business connections with the United States.

Mr. Allan in appearance is about the medium height, with full beard, clear blue eyes and well defined regular features. His movements are quick, firm in his convictions, which are seldom at fault, energetic and untiring in all he undertakes, prompt in business, with an intuitive knowledge of that which will best tend to the public good.

By his fellow citizens he is recognised and noted for a singular amount of administrative ability, and their confidence in it is unbounded.

There are few men in any country whose business avocations involve a greater amount of thought, labor and responsibility. Taking therefore all these facts into consideration, the new Dominion, the adopted home of Mr. Allan, may well be proud of her son.

Unostentations in his manner, his maxim, "to do the greatest good for the greatest number," a worthy citizen, a public benefactor and a staunch friend, there is no one in the Commonwealth or one who would be more highly preferred by the citizens for the honors of Knighthood than Hugh Allan.

#### Wire Railways.

"A railway without cuttings, embankments, tunnels, viaducts, or bridges, no matter how hilly the country to be traversed"—such is the definition given by *Herapath's Journal* of an invention now in use in Leicestershire, and a working model of which may be seen in Gresham street, E. C. The Wire Railway provides a simple and cheap substitute for a line of rails, and is of great service where, from the scarcity or intermittent character of the traffic, or the engineering difficulties of the ground to be got over, it is either not expedient or impossible to go through the expensive process of forming a local railway. For the wire spans over and evades obstacles in place of burrowing under or levelling them, and will perform its task as easily along a rugged tract of country as on the smoothest road. The experiment being now prosecuted with complete success between some Leicestershire stone quarries and a railway station three miles distant, consists of an endless wire rope, supported on a series of pulleys carried by substantial posts, which are ordinarily about 150 feet apart, but the interval between which may be greatly extended, as is shown in one case where the span from post to post is 600 feet. One of the ends of this rope passes round a Fowler's clip drum, worked by a portable steam engine, and this drives the rope at a speed of six miles an hour. Boxes are hung on the rope at the loading end near the quarries by a pendant which is ingeniously arranged to preserve a perfect equilibrium, and at the same time to pass without hindrance over the supports. Each of these boxes carries one hundred weight of stone, and the delivery is at the rate of 200 boxes, or 10 tons per hour for the three mile distance.

Already wire railways on the Leicestershire model are in course of erection in France, Italy and Spain. Negotiations are on foot, too, between the Turkish Government and the engineers here, and it is not improbable that this generation may see goods carried by wire as commonly as messages. The railway is, indeed, not unlike an exceedingly stout electric telegraph; and there is something almost droll in the sight of a regiment of well laden trucks or boxes passing gravely along it at stated intervals, and at a regular

pace, much as if they were at aerial drill. The most important point in Mr. Hodgson's invention is his method of passing the points of support, which consists in so curving the frame of the truck, or box, as to make the centre of gravity come under the rope. So admirably is this managed that some of our leading engineers have been discussing quite recently the possibility of constructing a stout wire railway between Dover and Calais, which should be supported from a line of pillars sunk in mid ocean, and along which passengers could be conveyed. The cost would be comparatively small, and suspensory trains could, it is argued, be dispatched across the Channel without difficulty or danger.

It should be stated that where heavy loads must necessarily be carried, a pair of stationary supporting ropes, with an endless running rope for the motive power, are employed, and that by these means as many as a thousand tons per day can be easily conveyed. The cost of erecting these railways in England, and of supplying motive power and rolling stock, is from £250 a mile for carrying 50 tons a day, in boxes holding half a hundred weight each, to £1,000 a mile for one of the double rope lines, to carry 1,000 tons a day, in boxes or trucks holding six hundred weight each. For all districts where there is traffic, but where it would not pay to construct a railway, the wire railway is particularly applicable, and, as will be readily understood, wherever there is standing room for posts, there a line can be erected. A recent application from traders in copper for putting one up for them, which should run through an African forest, and over an African jungle down to the coast, illustrates the varied circumstances under which the new system of transport may be applied.—*London News*.

#### Marriage by Telegraph.

The Paris correspondent of the *London Star* finds time amid the excitement of the French elections to pen this bit of social gossip: "You will remember the sensation produced last spring by the Duke of Beaufremont having been warned by a fair friend of the danger he was in of being poisoned by means of a *bonbon* to be offered to him at one of the *balls de l'opera*. The duke left Paris after the affair. His name has come again before the public in consequence of his wife pleading for separation *de corps et de biens*. The duchess, *nee* Valentine de Chimay, was still at the convent where she was educated when her consent to her marriage was asked by telegraph. The young heiress, flattered by the prospect of becoming the wife of a distinguished officer, consented by the same unromantic mode of transit. Immediately after the wedding ceremony she accompanied her husband, with whom she fell desperately in love, to the various garrisons where he was quartered, followed him on all possible occasions, and especially appears to have risked her health by taking long and fatiguing rides in his company. Two children were successively born, when the Mexican war gave the duke a pretext to separate himself from her. The duchess took her children to her chateau near Nanteuil, where, during his absence, she acted as agent and superintendent of the property, writing by every mail long and admirable reports of the improvements she was carrying out on the estate. Her attachment, unfortunately, never diminished, although in her family the duke's flagrant infidelity was perfectly known. Her anxiety for him during the Mexican campaign impaired her health, and immense was her joy when the return of the expedition was announced. With nervous impatience she awaited the telegram which would bring her the glad tidings of her husband's return. All her illusions soon revived and even strengthened in her absence. She conjured visions of renewed and eternal happiness.

At last the anxiously expected missive reached her chateau. It was dated, not from St. Nazaire, where the troops had landed, but from Paris, and ran thus: 'I cannot find any shirts; inform me by telegram when you have put them. (Signed) BEAUFFREMONT.'

#### To the North Pole by Balloon.

A new and daring experiment is noted by the *Pal Mall Gazette*: "The invariable failure which has hitherto attended nautical expeditions to the Arctic regions has induced two Frenchmen, Messieurs Te-sandier and De Fouvielle, to undertake the enterprise of reaching the North Pole in a balloon. The machine in which the bold adventurers are about to embark on their perilous journey, and which is appropriately named 'Le Pole Nord,' is now being completed in the Champ de Mars, which the Government have placed at their disposal for the purpose.

The monster balloon, beside which even the famous Geant would seem a mere toy, will contain over 10,000 cubic meters of gas, and is composed entirely of cloth manufactured from caoutchouc, which will allow of great expansion in the rarefied strata of the atmosphere. The seams uniting the different pieces form a total length of three English miles. The car, as it is said, of strength and lightness, is constructed to carry ten passengers, 4,000 pounds of ballast and provisions for a month.

#### On a New Thermo-Electric Battery made with Galena.

M. M. Mure and Clamond. This battery is composed of sixty elements, made up of small bars of galena, 40 m.m. in length by 8 m.m. thick, and bars of thin sheet iron, 55 m.m. in length by 8 m.m. in width, and 0.6 m.m. thickness. These materials have been arranged so as to form a hollow cylinder, which, when it is intended to be used, is to be heated by a peculiarly constructed gas burner. The specimen of this battery exhibited at the meeting, had an electro-motive force of  $1\frac{1}{2}$  Bunsen element. M. Becquerel read a lengthy paper on the subject of this battery, the result of which is, that thermo-electric batteries, constructed either of metallic alloys, or, as in this case, of a metallic sulphide and a metal, are not economical in use, and are too liable to changes brought on by the effects of the heat.

#### Utilization of Street Dust.

The dust from the macadamized streets of Paris it is stated, yields an income of \$2,000 per annum to an ingenious individual of that city. He collects the mud from the streets, which near the houses in course of construction contains so much stone dust; he then places it in large tubs, passes the deposit through sieves, allows it to form a concrete, which he then forms into the long yellow bricks for knife-cleaning. The material costs nothing, the labor is insignificant, but the bricks sell for twenty cents each.

#### To clear a Room of Mosquitos.

A writer in a South Carolina paper says: "I have tried the following, and find it to work like a charm. Take of gum camphor a piece about one third the size of an egg, and evaporate it by placing it in a tin vessel, and holding it over a lamp or candle, taking care that it does not ignite. The smoke will soon fill the room, and expel the mosquitos. One night I was terribly annoyed by them, when I thought of and tried the above, after which I never saw or heard of them that night, and the next morning there was not one to be found in the room, though the window had been left open all that night."

## The French Atlantic Cable.

This cable, which has just been successfully laid from the Great Eastern steamship, has some modifications of construction. The gutta-percha employed for insulation is brought direct from Singapore, as it left the hands of the natives, in the shape of unsightly idols, deformed quadrupeds, caricatures of patriarchs, dogs, ships' birds, and is made into a paste for protecting the electric core. The copper wire is received from the wire mills in hanks of fifteen or twenty pounds each, each hank being tested on its arrival to ascertain its conductivity, none below a certain standard being allowed to be used. The conductor consists of a strand of seven wires, 0.56 inch in diameter, or a little less than one-sixteenth of an inch, six being twisted round the central wire. The seven wires are rendered perfectly compact by the coating of the central wire with an adhesive matter known as "Chatterton's Compound." The weight of the complete strand is four hundred pounds per nautical mile. It is made in lengths of about one mile, and wound on reels ready to be covered with gutta percha. The strand is passed through a vessel of Chatterton's Compound, and through a die corresponding to the size of the first coating of gutta percha, which is forced round the strand as it passes through the die. Four successive coats are thus applied, and between each coating the wire receives a film of the compound, which improves the insulation and binds the coats together. The total weight of the core is 800 lbs. per nautical mile, equally divided between the copper and the gutta percha. The total length of cable for the section between Brest and St. Pierre is 2,788 nautical miles, the second section thence to New York 776 nautical miles long, the smaller wire consisting of a conductor of 197 lbs. per nautical mile, and a covering 150 lbs. per mile. The cable thus prepared is finished with a serving of jute yarn and ten wires of homogeneous iron, each of which is covered with manilla yarn steeped in tar.—*The Engineering and Mining Journal*.

## The Zirconia Light.

The oxyhydrogen zirconia light has been such a success at the Tuilleries, having been worked without interruption since the 21st of January, that the Emperor has ordered measures to be taken to render that mode of illumination permanent in front of his palace. During the interval required for getting these new arrangements ready, the court will be lit up with ordinary gas as before. In connection with this fact M. Tessie du Mothay has had the Order of Chevalier of the Legion of Honor bestowed upon him, and well has he merited it, for his many useful and practical inventions. Whether the process introduced by this gentleman for the commercial manufacture of oxygen from the manganates is the best that can be used for the purpose, may, perhaps, be open to discussion; this, at any rate, is true, that it is the only process that has succeeded on a large practical scale up to the present time.—*British Journal of Photography*.

## Mr. Hubbard Still Busy.

We wrote this gentleman dead. We were mistaken. He still pursues his postal telegraph scheme with all the keenness and perseverance of a New Englander. The demolition of his plans before the last Congress by the irresistible logic of facts and figures, staggered but did not slay him. We are to find him anon the hero of a new battle, with new collaborators, and a new base. But he will find that the transparent selfishness of his former schemes has put the public mind on guard, and that the logic of the old facts will be more irresistible by the lapse of time, aided as they will be by the growing desire of the people to keep Congress from old schemes which may hinder the payment of our national debt.

### Playing with Lightning.

Our classical reminiscences have left us with the conviction that, when Vulcan forged the bolts of Jove, the scene must have been, as the graphic reporter has it, "one of terrific grandeur." We pictured to ourselves the lame god and his Cyclopean assistants, hammering and forging the celestial weapons in some flaming cavern of Etna or Vesuvius, amid an eternal din like that of a chain cable factory crossed with a rolling mill. Lurid smoke rolls heavily upward through the fiery air; the molten lava rushes forth on its work of destruction, while the lightnings that now and again play round the top of the groaning mountain, proclaim to a trembling world the tremendous nature of the operations going on below.

Although we had inspected electrical machines, and had looked as scientific as possible at the sparks we had seen elicited from them, the grand and heroic idea of lightning making had never left us. Consequently, when we were told that lightning was made and exhibited at certain stated hours, in the unromantic district of Regent Street, we received the statement with some incredulity; and it was to test its truth that, after many years, we came to revisit the Polytechnic. Let us endeavor to give some account of what we learn from the lucid and interesting lecture, which explained to us the extraordinary performances of the great induction coil.

It was discovered by Faraday, many years ago, that a coil of wire, wound loosely round a magnet, became actively electric at the moment when the magnet was either placed within its folds or withdrawn from them, and also that a galvanic current, in passing round a conducting circuit, produces an "induced" current in another conductor that surrounds the first. A galvanic current is usually generated by what is called a galvanic battery, consisting of two dissimilar metals or other substances, technically named elements, not touching each other, but immersed in some acid fluid. Chemical action is excited, and electricity, in the form known as galvanism, is set free. If the elements are connected together, outside the acid, by a piece of wire, or any other conductor, the electricity will proceed from one element, called the positive pole of the battery, and will pass along the wire to the other or negative pole, thus making what is called a circuit. If the wire be interrupted, the electricity, if present in sufficient quantity, will leap across the gap in the form of a visible spark. The gap be filled by any substance capable of being chemically decomposed by electricity, the decomposition will take place. In all this we have only the galvanic battery, and the primary current directly proceeding from it.

Now Faraday's discovery was, that this galvanic or primary current, at the moment when it begins to flow, and again at the moment when it ceases to flow, produces a secondary or induced, and perfectly independent current, in another conductor wound round the first, but not in contact with it. At the moment when the primary current begins to flow, the induced current passes in the same direction with it; but at the moment when the primary current ceases to flow, the induced current passes in the opposite direction. Instead of being, as in the primary current, continuous, the induced current is only momentary; and, in order to produce it at pleasure, it is necessary to have some contrivance by which to cut off and to restore the primary current as often as may be desired. As often as it is cut off, the reversed induced current passes; as often as it is restored, the direct induced current passes. The instrument used for this purpose is called a break or contact breaker. It is placed in a gap in the primary or galvanic circuit, communicating with one extremity of the gap, and capable of being made to

touch the other extremity also. When it touches, it is said to "make" contact, and when it ceases to touch, it "breaks" contact.

Not only does the magnet, like the primary current, induce electricity, but a piece of soft iron is rendered magnetic during the passage of a primary current through a coil of wire surrounding it. If the iron be massive, it retains its magnetic quality for a few moments after the galvanic current ceases; but, if it be of small bulk, it gives up its magnetism immediately.

In the manufacture of a "coil" for the display of induced electricity, all the foregoing facts are taken into account. The centre or core of the coil is formed of a bundle of soft iron wire. Around this is wound the wire for the primary current, and around this again the wire for the secondary current. When the ends of the primary wire are connected with the two poles of a galvanic battery, the core of iron wires becomes a core of magnets, and hence assists the primary current in inducing electricity in the secondary wire. When the ends of the primary wire are disconnected from the battery, the core ceases to be magnetic, and the withdrawal of the magnet assists the cessation of the primary current in again inducing electricity in the secondary wire.

The largest induction coils hitherto made have been about a foot or fifteen inches in length, by about four inches in diameter. Seven miles has been about the extreme limit of length of the secondary wire; and nine inches the greatest length of spark that could be obtained. With these figures as standards of comparison, we approach the "monster coil" now under consideration.

In this, the central core of iron wires is composed of pieces each five feet long, and the thickness of knitting needles, the whole core being five inches in diameter. The primary wire is of copper, thirty-seven hundred and seventy yards in length. The secondary wire is also of copper, and is one hundred and fifty miles in length. The rods of the core are separated from one another, or insulated, by being wound round with cotton, and the primary wire is covered in a similar manner. The secondary wire is covered with silk; and all these coverings are required in order to force the current to keep within each wire, or to pass along its length, instead of escaping from it laterally to contiguous turns of the spiral. The whole apparatus is enclosed within cylinders of vulcanite, and is mounted on strong supports, themselves similarly covered. The ends of the secondary wire issue one from each extremity of the coil, and are connected to "terminals," one of which is a point, and the other a polished disc of metal. They stand on movable columns in front of the coil; and the wires, when necessary, can be detached from the terminals, and attached to any other apparatus that may be required. When the primary wire is connected with a powerful galvanic battery, and contact is made, the core becomes a bundle of magnets, and this bundle combines with the primary wire to induce an electric current in the secondary wire. When contact is broken, the primary current ceases to flow, the core loses its magnetism, and an electric current is again induced in the secondary wire. If the terminals be not too far apart, this induced current leaps across the space between them in the form of a visible spark or flash.

There is yet another piece of subsidiary apparatus, called the condenser. This consists of a number of small sheets of insulated tin foil, connected together, and with the primary wire, to which they form a sort of loop circuit. The condenser is supposed to afford a safety-valve, or reservoir of space for the primary current, and a security against any injury being done to the primary wire by the sudden rushing into it of a stream of electricity.

The first endeavors to work the new coil were frustrated by its own powers of destruction. It melted the platinum, and burnt up the brass of the original contact breaker. When used with a small amount of condenser surface, it burst the primary wire into fragments, and escaped from it laterally. When these difficulties were overcome, and the whole apparatus was in order, it afforded a spark, or rather a flash of lightning, twenty-nine inches in length, and apparently about a third of an inch in width. The length was measured, of course, by the distance between the terminals, and when this exceeded twenty-nine inches no distinct flash was given. For a distance within its power to cross, it would almost seem that the electricity, like a strong leaper, makes an effort proportionate to the resistance to be overcome. When the terminals are distant, but still within the twenty-nine inch limit, the flash strikes upon the disc with a heavy shock and a loud report. When they are near together, or within two or three inches, the flash gushes forth without noise, and lazily, like a spurt of molten metal or of dense flame; and from this "flaming spark," as it is called, the flaming portion can be blown aside by bellows, leaving the actual course of the electricity distinctly visible. Either the flaming spark or the longer one will perforate considerable thicknesses of glass, and five inches of solid plate glass have already been pierced by it. At one visit we chanced to see a remarkable illustration of the way in which metallic surfaces may serve to attract lightning. The outer covering of the coil displays the name and address of Mr. Appa, its maker, in gold letters of considerable size. In taking a long spark, the stands that support the terminals were placed nearer to the coil than usual; and the attraction of these gold leaf surfaces was sufficient to divert the spark from its course, and visibly to break it up into portions.

In the darkened theatre at the Polytechnic, the long flash lights up the room and the audience with the peculiar lurid glare so well known as an effect of brilliant lightning at night, and displays the features and action of every one present. But it is curious to note that, the flash being of instantaneous duration only, it allows no motion to be seen. We should think, if guided by our consciousness alone, that the flash lasted an appreciable time; but this would be an error due to the persistence of the impression on the eye after the flash itself had ceased. If the room be made perfectly dark, and if the spectators all raise their arms and wave their hands to and fro as quickly as they can, the flash will display the position of the arms but not the movement of the hands. *While the flash lasts, the hand has no time to move, and is consequently seen, as if motionless, in the position in which the flash finds it.* It is in contemplation to exhibit the same effect in a more complete way by affixing a revolving disc. When the disc revolves so rapidly that no outlines of the picture can be distinguished by means of any ordinary light, they will be perfectly seen in a darkened room by the light of the flash. It lasts so short a time, that the revolving disc does not change its position in the brief period.

It is the smallest part of the advantage expected from the new coil, that it allows all the luminous and all the destructive phenomena of chamber electricity to be exhibited, in hitherto unapproached beauty and intensity. Men of science anticipate from it new discoveries of high importance.

We publish among the happy men who have bidden farewell to single blessedness, our friend George D. Butler, of Rochester, N. Y., to whom we kiss our hand in token of our blessing. We wish him and his handsome lady love a long and happy life.

## Scintillations from Scientific Authors.

BY MADISON BUELL.

Faraday stated that a flash of lightning contains so small a quantity of electricity that it would not suffice to decompose more than a single drop of water; its enormous tension would be wasted and only converted into heat. There is one sense, however, in which this statement would not be strictly accurate. Assuming the tension of the lightning to be a million cells, and assuming the tension of one cell to be sufficient to decompose water, it is clear that by passing the flash of lightning through a million vessels of water in a series, we should have tension enough to decompose a drop of water in each vessel and thus decompose a million drops.

Although the phenomena of electrical induction enter more or less into every case of electrical action, they rarely come within the cognizance of those who have charge of land lines.

It is important to observe, that in speaking of the resistance of any circuit, we speak of the *whole* resistance, including that of the instrument, of the conducting wires and line circuit, and of the *battery* itself, which *last* is frequently a very important part of the whole resistance, and must on no account be forgotten.

The conductivity of ordinary galvanized iron wire compared with pure copper 100, averages about 14, or about 1-7th that of pure copper.

The resistance of No. 8 iron wire is about 13-5 ohms per statute mile, and of No. 4, about 6-8 ohms.

The resistance of iron increases about .35 per cent. for each degree Fahr.

Conduction is the converse of resistance.

The resistance of a *small* fault is much greater with a small battery power, say five cells, than with a higher power, say fifty cells.

Lightning is the most extreme case of tension with which we are acquainted (if we except, perhaps, the Aurora Borealis), and we may often see a flash a quarter of a mile in length.

Heat and Light appear to be rather *modifications* of the same forces, than distinct forces mutually dependent.

Of absolute rest, Nature gives us no evidence; all matter is ever in movement, not merely in masses, but, also, molecularly or throughout its most intimate structures.

It is a circumstance worthy of remark, that the arrangement of molecules, which renders a solid body capable of transmitting light, is most unfavorable to its transmission of electricity.

Portions of muscle and nerve present different electrical states with reference to other portions of the same muscle or nerve; thus the external part of a muscle bears the same relation to the internal part, as platinum does to zinc in the voltaic battery.

Magnetism and Electricity, and the terms which belong to these sciences, are taken possession of and applied in cases in which we know that the sciences from which the names are conveyed, have not the smallest application.

The world little knows how many of the thoughts and theories which have passed through the mind of a scientific investigator, have been crushed in silence and secrecy by his own severe criticism and adverse examination.

## The Western Terminus of the French Cable.

Duxbury, the American terminus of the French Atlantic Cable, is fully described, together with its surroundings, by the *Boston Journal*. The following account of it is interesting:

"The place selected for the western terminus of the cable is at Rouse's Hummock, so called, in the town of Duxbury. This is situated near the Gurnet light, at the entrance of Plymouth Harbor, and in a direct line is about one mile and a half from the village, but it cannot be approached without driving around the beach a distance of five or six miles, unless one feels disposed to cross marshes and rivers, which, in a direct line, intervene between it and the village. The Hummock is a conical shaped hill, and embraces about thirty or forty acres of land, covered with a slight growth of wood. Its highest point is about fifty feet above the level of the ocean, from which a beautiful view of the majestic ocean and the surrounding country can be had. The cable company have erected a building at this place, in which the ocean cable will be placed.

"As the French Cable Company had not acquired the power from Congress previous to its adjournment to lay and maintain a cable on the shores of the United States, in order not to retard the progress of this great work, a charter was granted by the Legislature of Massachusetts to the Ocean Telegraph Company, whose line meets the cable outside the jurisdiction of the United States, thus obviating all difficulties that might otherwise have occurred. A man will be stationed in the building to guard the cable against danger, and in case of a break it will be tested at this point. But from here a land cable is spliced to it, which is to be laid across the marshes, in a trench constructed for that purpose, where it is conducted to the main office, in the old Bank Building at Duxbury village.

"From here an independent land line is being constructed to Boston, and it is supposed that one will soon be built to New York. This office will be under the charge of Mr. L. G. Watson, of New York, the general superintendent and managing agent of the company, assisted by Mr. R. T. Brown, of London, the manager of the land lines. Mr. M. J. Gaines, formerly Consul-General for the United States at Tripoli, but who for the past seven or eight years has been engaged in telegraphic service in the Mediterranean, is to be the chief clerk in charge of the cable, and a force of about twelve electricians will be required to perform the duties of the cable and land lines.

"The steamers which are to convey the section of cable from St. Pierre to Duxbury are expected to arrive about the 25th of the present month, when it is proposed to celebrate the event by an appropriate demonstration. Although the American people could hardly be supposed to feel the electric thrill produced by the successful laying of the Atlantic Cable, having become accustomed to great improvements and stirring events, yet they cannot but appreciate the additional link in the progress of our country's success."

## Supposed Suicide of an Operator.

We are pained to learn that the body of James Silver, operator at the office of the Western Union Telegraph Office at Bound Brook, N. J., was found at the dam of the Raritan River, three miles south of that village, June 25th. He is supposed to have committed suicide by drowning on the 27th of June, at Bound Brook, but on what this suggestion is based we have no means of knowing. No reason for the act is given, and, so far, seems to be unknown.

## Decision in the Anderson Case.

In another part of the JOURNAL we have referred to the case of Mr. Anderson, who died before his application was received. The following note was handed us by Dr. Green (to whom we referred the case), too late for use instead of our own remarks: "It has been claimed that the declaration of a wish to insure, and remittance of the necessary premium through a person who had volunteered to collect a small club of applicants, was an insurance accepted by the agent of the association, even though the names were not received or known by the officers. The committee could not regard this claim as just or legal. The association sends out no agents authorized to receive money or to pledge policies. Friends who collect applications act rather as the voluntary agents of the applicants, and in their interest. The committee can not, therefore, feel justified in making an assessment on its members, with the penalty of forfeiting membership for non-payment; but the committee will be gratified if every member shall voluntarily contribute to the relief of Mr. Anderson's widow and orphan child, and will most cheerfully be the medium of receiving and forwarding such contributions from members, as also from any kind, benevolent friends who are not members of the association.

## Base Ball in Brooklyn.

The New York Telegrapher's nine will play a picked nine from the Stock Exchange, on the Star grounds, Brooklyn, on Saturday, July 17th. Game to commence at 3 o'clock.

There will also be a game played between the same parties on the same grounds, on Friday, July 23d. Game to commence at 3 P. M.

HOWARD SCOTT, of the Hanover Junction (Pa.) office, has resigned, and has accepted the Freight and Passenger Agency of the N. C. R. W. Co. at that point.

## An Anxious Youth.

The following is sent us from the manager of the office at Painesville, O., and is a rich specimen of an aspirant for telegraphic education. We give the application *verbatim et literatim*:

GREENWICH STATION Huron County Ohio ju 9th 186  
Sir I Wish youe Would Bee Soe Comadating and obliging to Rite to Me and tel Me now Wether youe take Students to lirn Tellegraphing Rite and tell mee how Much youe ask to lirn a Student Rite all the particulars

Rite Soe as youe get this if youe pleas I Would like to Come as Soe As Convlant to youe they have Student here I Cant git in here for I dont now long he Will Bee here I Spose he Will Stay here untill he gets an office

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, JULY 15, 1869.

### Annual Election.

On yesterday, Wednesday, July 14th, the annual meeting of the Western Union Telegraph Company was held at their executive rooms, 145 Broadway, New York. There was a good attendance, and there was represented personally and by proxy about twenty-five millions of the stock.

After the meeting had been organized, the President delivered his annual report, of which a synopsis will be given in a future number.

The annual election of Directors for the ensuing year was then held, Richard A. McCurdy, George Wales Soren and James D. Reid acting as inspectors, when the following gentlemen were declared elected:

#### BOARD OF DIRECTORS.

D. N. Barney, New York.	W. E. Dodge, New York.
E. S. Burrows, Albion, N. Y.	Francis Morris, New York.
Ezra Cornell, Ithaca, N. Y.	C. Livingston, New York.
John D. Caton, Ottawa, Ill.	E. S. Sandford, New York.
Z. G. Simmons, Kenosha, Wis.	William Orton, New York.
R. A. Lancaster, Richmond, Va.	Harrison Durkee, New York.
A. B. Cornell, Ithaca, N. Y.	James C. Fargo, New York.
E. Creighton, Omaha, Neb.	A. W. Greenleaf, New York.
N. Green, Louisville, Ky.	E. B. Wesley, New York.
Wilson G. Hunt, New York.	Hiram Sibley, Rochester, N. Y.
Geo. Jones, New York.	G. H. Mumford, Rochester, N. Y.
O. H. Palmer, New York.	J. H. Wade, Cleveland, O.
Moses Taylor, New York.	Geo. Walker, Springfield, Mass.
E. D. Morgan, New York.	Alfred Gaither, Cincinnati.

Hugh Allan, Montreal.

At a meeting held by the newly appointed Board, the following officers were elected to serve until the second Wednesday in October, 1870, which, by unanimous vote, was made the period of future annual meetings:

William Orton, President.	
Norvin Green,	} Vice-Presidents.
A. B. Cornell,	
George Walker,	
O. H. Palmer, Secretary and Treasurer.	
W. H. Abel, Auditor.	
James D. Reid,	} Inspectors of Election.
Richard A. McCurdy,	
George Wales Soren,	

### Hugh Allan.

We publish with right good will a biographical sketch of a gentleman widely and well known both in Canada and in the United States as a genial, liberal, sagacious, enterprising man. Mr. Allan carries success on his face just as the prows of his magnificent ships seem to bear a smile of triumph above the waves. We presume he has his hours of care, but they do not appear on the robust, joyous, generous face he carries when we have had the pleasure of seeing him in his occasional visits to New York. His likeness, which we deem an excellent one, will impress those who see it as the verisimilitude of a hearty, well poised, executive, generous character. Under his management the

telegraph has been a continued blessing to the Canadian people.

Mr. Allan resides in Montreal, a city which owes much to his enterprise and taste, and "Raven's Crag," the name he has given to his princely home, stands on the brow of the mountain which overlooks the city, and is probably the finest residence within its limits. The grounds around it are extensive, and laid out with exquisite taste. They are surrounded by a massive stone wall, and are entered through the Porter's Lodge, itself a beautiful and pleasing looking structure. In the mansion there is to be found everything to denote high culture and refinement, and every appliance for indoor enjoyment.

It is not the fashion in our republican society to confer titles upon distinguished men who have done their country honored service. It is different, however, with our neighbors of the New Dominion and in England, where a title is the gift of a marked service to the State. We are sure that, if the honor of knighthood is the guerdon of the State for useful citizenship and high qualities of personal character, there is no one of our neighboring citizens who is better entitled to the sword stroke which confers it than Mr. Allan. Were we the Queen, we would slap his broad shoulders and order him to "Rise, Sir Hugh Allan," with abundant pleasure.

Since the above was written Mr. Allan has been elected a Director of the Western Union Telegraph Company.

### Construction of Cyphers.

#### NECESSITY OF CHOOSING CYPHER WORDS DISSIMILAR IN TELEGRAPHIC ORTHOGRAPHY.

No one but a practical telegrapher is competent to make up a safe and reliable practical cypher that will be comparatively free from the danger of errors in transmission over the wires. Cypher words of the same length may be very different in pronunciation or in print, and yet be so nearly alike when written in telegraphic characters, as to be difficult to distinguish one from the other by sound or sight, in the absence of connecting words in making sense and meaning. Especially is this so when an instrument is slightly out of order, or some atmospheric influence may prolong a dot to a dash or abbreviate a dash to a dot, or leave the receiving operator in doubt as to which was intended. It often happens in telegraphic orthography that the only difference between two words is the use of a dash in forming one of the letters in one word, and a dot in making a letter similarly placed in the other, the transposition of which utterly changes the word and sense. If two such words thus easily transposed be used in the same cypher to mean different things, errors will inevitably occur; and in business messages may mislead in large transactions and involve heavy losses.

It would be simple prudence, therefore, before adopting a cypher for business uses in telegraphing, first to submit it to the careful examination of a practical telegrapher, or an expert familiar with the telegraphic alphabet, in order to discard the use of one or other of any two words that shall be found very similar in telegraphic orthography. In such submission it

is not necessary that the party inspecting the cypher shall be informed of what the words are intended to mean. It is only with a view of pruning the words thus easily converted from one to the other.

In receiving cypher messages a business man must not be seriously misled by the rendering of a word not used in his cypher. Such a rendering at once advertises itself as an error, and while it may fail to give him information he wants, it can not give him false information. The substitution, therefore, of one word for another word not used in the agreed cypher between correspondents, cannot effect the same injury as the change to another word that is also used in the cypher to represent a different figure or convey a different meaning.

Hence the importance in making up a cypher of choosing words so dissimilar in length, as well as in telegraphic construction, as to make their transposition if not absolutely impossible, at least unlikely to happen.

It might be well for telegraph companies to have made up and published for the benefit of their customers, a vocabulary of cypher words, not easily capable of conversion to other words in transmission by this slight variation of one or two telegraphic signals. From such a vocabulary business correspondents could select such words and attach to them such meanings they might choose to adopt, known only to themselves and to such confidential clerks as they deemed proper to intrust with their key.

### B. R. McAlpine, Esq.

By the time this reaches our readers, Mr. McAlpine, for the last three years one of the Vice-Presidents of the Western Union Telegraph Co., will be far on his way to Europe. To this journey Mr. McAlpine has been led by the condition of the health of his family, who are now at Lausanne, Switzerland, in the Hotel Gibbon, so named after the distinguished historian, who wrote his "Decline and Fall of the Roman Empire" beside the placid waters of Geneva, and in presence of the majestic scenery of that mountain republic. We bid him a hearty God speed in his journey, and envy him the freedom from care, and the inspiration of the historical atmosphere of the old world, which this separation from his ordinary duties secure to him. We trust that restored health to those who cause his departure will permit the full enjoyment of both.

Mr. McAlpine will be missed by the Company, from the service of which, both as Director and Vice-President, he now retires. In his peculiar sphere his course has been distinguished by a rigid adherence to fundamental rules, from which no present advantages could make him swerve, and in special watchfulness over those details of the service which were made his special care. In these details he was rigorously correct and particular. He permitted no irregularity, and exacted the most uncompromising obedience to established rules. Thoroughly just himself he claimed that an equal reciprocal service was the only just basis of contracts, and never lowered the Company in securing advantages for it, or in conflict with elements of danger. He was held in high respect by his associate officers, who deeply regret his separation from them. Mr. McAlpine sailed yesterday in the Cuba.

An article from Mr. Pope on the question of Aurora Currents will appear in our next number.

## OFFICIAL STATEMENT.

## The French Cable.

ST. PIERRE, Miquelon, July 14, 1869.

The ocean cable was spliced to the shore end to-day by the steamer William Corry.

The cause of the failure to splice yesterday was that the shore end was lost. The buoy was easily found, but when taken up it was discovered that the cable was detached, and it was therefore necessary to grapple for it.

Directly the splice was made the instruments and the full staff of operators were sent on shore, and communication was soon opened with Brest.

Sir James Anderson, the commander of the Great Eastern, had brought with him a sealed message which had been prepared by the Emperor Napoleon, and the purport of which was to remain unknown until it was opened on this side the Atlantic upon the completion of the cable, when the message was to be sent to the Emperor over the wires in order that he might thus judge of the accuracy of the transmission. This message was sent to-day.

BREST, July 14—Noon.

No signals have been received through the new cable from the Great Eastern since the dispatches of Monday. It is supposed, however, that no accident has occurred.

WASHINGTON, July 14, 1869.

With the exception of the "opinion" of Attorney General Hoar and the letters addressed to the French and the British Minister by Secretary Fish, no action has been taken by the Government to prevent the landing of the French cable on the coast of Massachusetts. Secretary Boutwell has not, as reported in some quarters, ordered a United States revenue cutter to proceed to the point where it is proposed to land the cable on United States territory and prevent it, nor is it likely that any such course will be pursued. The matter was pending in Congress at the adjournment, and it will probably be left to that body to settle it. Secretary Fish considered it his duty to place the French Minister in possession of the facts so far as the action of our Government has been developed relative to the landing of the cable, so that he might inform his Government of the risk it must run in attempting to land the cable on United States territory without authority from Congress.

The point to be insisted upon is that the government of the United States shall have equal facilities and privileges over the cable with that of France. This seems to be about the only objection to the landing of the cable in the minds of government officials. This, too, was the principal object which the Senate Committee on Foreign Relations had in view in reporting and urging the passage of the bill to prevent the landing of any foreign cable on the shores of the United States, without the consent of Congress.—*N. Y. Herald.*

## Married.

BUTLER—WILTON—On Thursday, June 17th, at Fairport, N. Y., by the Rev. J. Butler, George D. Butler and Miss Jennie Wilton, both of Rochester, N. Y.

TINGLE—HOLTZINGER. On Sunday, June 6, 1869, at the residence of the bride's mother, at Cumminsville, O., by the Rev. A. J. Reynolds, Will. C. Tingle, of the Western Union Telegraph Company, to Miss Ella E. Holtzinger.

## Executive Order No. 77.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
JULY 12, 1869.

ANSON STAGER,  
THOS. T. ECKERT,  
JOHN VAN HORNE, } Gen'l Superintendents.

Referring to Executive Order No. 25, it is now ordered that Columbus, Ohio, be, from and after this date, added to the list therein designated as "Night Offices."

Please issue the necessary instructions.

(Signed) WILLIAM ORTON, President.

## Eastern Division.

## RE-ARRANGEMENT OF DISTRICTS 3, 4, 5, 6 AND 7.

George B. Prescott, Esq., having been assigned to important duties in the Executive Office of the Western Union Telegraph Company in New York, has resigned the Superintendence of the Sixth District, Eastern Division, taking effect from the 1st of June, and the territory heretofore under his charge has been assigned as follows:

That portion of it from Montreal via Burlington and Rutland to Bellows Falls, Vt., from Rutland, Vt., to Albany, N. Y., via the several routes, and from Hoosic Falls, N. Y., to and including North Adams, Mass., to the Fourth District, George W. Gates, Sup't, White River Junction, Vt.

That part on the Housatonic R. R., from Bridgeport, Conn., to Pittsfield, Mass., and thence to North Adams, Mass., and the lines and offices belonging to the Boston and Albany R. R. route, from Springfield to Albany, to the Fifth District, Chas. F. Wood, Sup't, Boston, Mass.

That part on the Albany and Susquehanna R. R., from Albany to Binghamton, N. Y., to the Seventh District, S. B. Gifford, Sup't, Syracuse, N. Y.

The lines on the Hudson River Railway, the Harlem Railway, the Turnpike route between these roads, and on the Northern Railroad of New Jersey, from New York to Piermont, thence via Turnpike on the west bank of the Hudson, to and including the cities of Albany and Troy, now constitute the Sixth District, E. D., and Albert B. Chandler has been appointed Sup't, in addition to his present duties. Address, 145 Broadway, New York City.

The line from Concord, N. H., via Boston, Concord and Montreal R. R., to Littleton, N. H., thence to Northumberland, and via the White Mountains to Gorham, Conway and Meredith, N. H., with the offices thereon, has been assigned to the Third District, James S. Bedlow, Sup't, Portland, Me.

THOS. T. ECKERT,  
Gen'l Sup't, E. D.

Approved.

WILLIAM ORTON, President.  
June 14, 1869.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
JULY 15, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since July 1st, the date of the last tariff order. Please note them in your tariff books:

## NEW OFFICES.

Alexandria Bay, N. Y., } Tariff same as Clayton, N. Y.  
Redwood, N. Y., }  
Theresa, N. Y., }  
Downey, Iowa, tariff same as West Liberty, Iowa.  
Greenbrier, White Sulphur Springs, Va., tariff same as Covington, Va.  
Espyville, Pa., tariff same as Linesville, Pa.  
Golden City, Col., tariff same as Denver, Col.  
Healing Springs, Va., } Tariff same as Covington, Va.  
Hot Springs, Va., }  
Fredericktown, Madison Co., Mo., Mokena, Ill., and  
Sulphur Springs, Jefferson Co., Mo., tariff from offices having  
"Caton map," as given by map tariff. From all others, 65c. for

Fredericktown, 45c. for Sulphur Springs, more than rate to St. Louis, Mo., and for Mokena, tariff same as Joliet, Ill.

Missouri River, Iowa, tariff same as Council Bluffs, Iowa.

Nelson Furnace, Ky., tariff same as New Haven, Ky.

Pomona, N. J., tariff same as Egg Harbor, N. J., or 40c. more than rate to Philadelphia.

Teris, Ill., tariff same as Elvaston, Ill.

Van Dusenville, Mass., tariff same as Barrington, Mass.

## SUMMER OFFICES OPENED.

Boars Head, Hampton Beach, N. H., and

Ocean House, Rye Beach, N. H., tariff same as heretofore.

## NEW OFFICES ON OTHER LINES.

Aylmer, Ont., } 35.2 from Buffalo. Check Buffalo.  
Exeter, Ont., }  
Listowell, Ont., }

Girardville, Pa., tariff 35.3 from Philadelphia. Check Philadelphia.

Millville, Pa. (Erie line), tariff 50c. from New York, and from Binghamton, Elmira, Salamanca and Buffalo, same as Lackawanna.

Rocky Point, R. I., tariff 30.3 from Providence, R. I. Check Providence.

## OFFICES CLOSED.

Cranford, N. J., Marion Junction, Ala. Shawhan, Ky., Camden, Mo., Xenia, Ind., and Lagrange, Ga.

## TO OFFICES "HAVING SPECIAL SHEET A."

Tariff to Clarksville, Tenn., 75c. more than "special rate" to Louisville, Ky.

## GENERAL INFORMATION.

The following lists give the rate to points on "Other Lines" west of Omaha, Neb. The rates will take effect from the day of receipt of this order:

When computing tariff to any of the points named, the rate to Omaha, Cheyenne or Ogden, should be added to the rates here given from the same offices, and the business checked to Omaha, Cheyenne or Ogden, as indicated at the head of each list.

WILLIAM ORTON, President.

### Death of Albert Wyeth.

On the 9th inst. we were waited upon by a personal friend of Mr. Wyeth, formerly an operator of the Western Union Telegraph Company, who bore a letter from him, dated from the prison at Santiago, June 20th, asking, in manly terms, for intercession in his behalf, in order to secure his release, and intimating that time was given him for that purpose. Although the *N. Y. Herald* had, on that morning, made announcement that Wyeth had been publicly shot, yet, hoping that it might prove to be an error, the officers of the Western Union and the International Ocean Telegraph Companies were entreated to make an effort to save him. The following correspondence shows with what result. It is barely possible that Wyeth may have had the time granted to him which his letter intimated, but the announcement of his having been shot comes too officially to leave much hope.

Mr. Wyeth bore, we believe, a most excellent character, and we deeply regret his death.

NEW YORK, July 9, 1869.

To J. NENNINGER, Esq., V. P., Havana, Cuba:

Will you do me the favor to ascertain, from either American or Spanish officials, whether Albert Wyeth, telegrapher, late of New York, and prisoner at Santiago de Cuba, June 20th, has been executed, as reported in New York papers. If not, can you not have proceedings stayed until papers can be forwarded from here which will no doubt procure his release. Answer.

THOS. P. BLADEN.

I earnestly unite in the above request, and hope the Government will release this young man as a special concession to the Telegraph.

WILLIAM ORTON,

Pres't W. U. T. Co.

HAVANA, July 9.

To WM. ORTON, Esq., Pres't W. U. T. Co., New York:

I regret to be under the painful necessity of informing you that the *Diario De La Marina*, of this city, copying from a paper published in Santiago, reports that Mr. Albert Wyeth, notwithstanding his declaration that he was an innocent passenger on the "Grapeshot," was shot in Santiago on the 21st ult. If your application had reached here earlier, his excellency, the Captain General, who is actuated by the most humane principles, would doubtless have stayed the execution until your evidence could have reached him through the U. S. Government. "73."

J. NENNINGER.

### CONFIRMATION OF HIS DEATH.

Since the foregoing dispatches were put in type the following letter from Mr. Wyeth has been placed in our hands by his friend Eugene L. Castner, of the Western Union office at the Fifth Avenue Hotel. There is no evidence of trepidation in its firm chirography, and poor Wyeth has met his fate like a man. The letter will appeal to all hearts:

SANTIAGO DE CUBA, June 21, 1869.

DEAR GEORGE:

Good bye. I will be shot at seven o'clock this morning. It is now about three A. M. I was sentenced about twelve o'clock last night. I have just been baptized in the Catholic chapel here, and will pass the few hours of life that yet remain to me here with the good priests. Tell George and Newell, and all my other friends, of my fate. All who came on the vessel have been shot. There are three others who came on the vessel who die with me. There is no hope whatever, and be assured you will never see me again on earth. My love to Newell and George and all the rest. Send my trunk with contents to my mother, Mrs. E. J. Wyeth, Chambersburg, Pa. Good bye. Be prepared to meet me in Heaven, whither, I trust, I am going. Good bye to Frank, Andrew and all. Your friend to the last, AL.

### The Electric Lamp.

Mr. John Browning, F. R. A. S., the optician who manufactured the great telescope for the government of India to photograph the late eclipse, has contrived a most ingenious, simple, convenient and cheap automatic lamp. For all purposes, whether of photography or lecture demonstration, this lamp will be equally suitable as the older forms, since it gives a steady intense light, and so to speak manages itself. As the light however is, though brilliant, yet small, it is necessary that the lenses and pictures employed in demonstration with the lantern be of a very perfect character, else strife will make their appearance. This lamp will in most cases supersede the lime lamp, because not only is it prepared for work in a few moments, but all chance of explosion (to which the lime light is very liable) is completely removed. The plan of construction differs from that in use in the ordinary electric lamp. In those the carbon points are pulled a limited distance apart by automatic electro-magnetic apparatus, that distance being sufficient to give the maximum of light without breaking the flow of the current. In the new lamp there is no pulling apart of the carbon points, the battery power being so weak that all such movements would be useless. The principle adopted in the case before us is to let the carbon points touch each other, and to clamp them in that position, so that the current has to burn an interval between the two points for itself. The battery power used is very small, about six Grove's cells. The moment the current ceases to pass, the magnet ceases to be a magnet, the armature rises, the clamp is loosened, and the bar falls, and approximates the points sufficiently to continue the current, and then the armature is again drawn down, and the bar clamped.

It might be thought from this that the light would be an interrupted one, but this is not the case. The cessations of the current are of such extremely short duration, that the impression of one flash does not leave the retina before another appears, so that the light from the lamp is practically constant. If the ear be applied near the lamp, feeble vibrations indicating the making and breaking of contact will be heard, but the eye can only see a steady, continuous light. With a battery of six or eight cells, a 9ft lantern disc may be brilliantly illuminated, and this lamp, with regard to cleanliness, cost, efficiency, and absence of danger, has no competitors.

### The Faraday Memorial.

The *Chemical News* says: "It is a matter of much satisfaction to know that at length steps have been taken to provide a memorial to Faraday in the form of a statue. That the government have held aloof from taking any part in this memorial is much to be regretted, but the Chancellor of the Exchequer has stated that he is only following precedent in not allowing public moneys to be expended on a memorial to a private citizen. But was Faraday a private citizen? In one very limited sense, indeed, he was, but in point of fact, he was a cosmopolitan. "Faraday," said M. Dumas, "n'appartient pas seul à l'Angleterre, il appartient à tout le monde." A private citizen! Who has more promoted works for the weal of his country, for the welfare of his race? We hope that not only the scientific men of this country will promote the Faraday memorial, but that the whole country will subscribe to it, and that we may have not alone a statue to this great man, not alone the lectureship and medal, but some greater work, and we would suggest, as we have before done, that it should take the form of a Public Laboratory, which would afford to those who have longings for science, but who lack opportunity, a means of satisfying the yearnings of

their genius. To those who "fall gloriously fighting in the service of their country, to those who in the Senate have promoted large interests, successful negotiations, an honorable peace, or a triumphant war, the country and the Government never fail to raise memorials, and to give honor. Let them honor him who working quietly and steadily, and firmly, has added so much to the internal wealth of this country, so much to the scientific literature of the world. Faraday ever held in his hand "Lampas investigationis non torris contradictionis," and the bright steadfast light illumines all that he did, and enveloped him as he passed untimely from our sight.

### Will the Administration Defend the National Honor?

[From the New York Sun.]

The company for laying a telegraph cable from France to this country will, it is said, shortly attempt to consummate its enterprise by landing the hither end of the cable upon the shore of Massachusetts. It will pretend to do this under color of authority from the Massachusetts Legislature, but the act, if committed, will be none the less a gross violation of international law, and an insult to the dignity of the United States.

That every nation has sole and exclusive control over the waters of the ocean for a distance of a marine league or three miles from its coast, is as well settled as any rule can be, and the United States is no exception to it. It is equally well settled that the jurisdiction of individual States of the Union extends only to low water mark. The Massachusetts charter, give them the right to use the soil of Massachusetts to this extent. For a distance of three miles beyond low water mark they will have to trench upon the national domain; and if they lay their cable across this territory before receiving permission from Congress they will virtually declare that the United States, as a nation, has no maritime rights which foreign adventurers are bound to respect.

Our Secretary of State has, it is reported, addressed a diplomatic note in duplicate to the British Minister and the French Charge d'Affaires at Washington, informing them of the failure of the French company to obtain permission from Congress to do the precise thing they now threaten doing, and virtually notifying them that the execution of the threat will be regarded by him as a violation of national rights. Up to the distance of three miles of the shore they are at liberty to do what they please short of committing piracy; but once within the three miles, they should be met and effectively turned back.

### The Sabbath.

The streams of religion run deeper or shallower at the banks of the Sabbath are kept up or neglected.—*Calcott.*

Give to the world one half of the Sunday, and you will find that religion has no strong hold of the other half.—*Sir Walter Scott.*

I feel as if God had, by giving the Sabbath, given fifty-two springs in the year.—*S. T. Coleridge.*

Where there is no Christian Sabbath, there is no Christian morality; and without this free institutions can not long be sustained.—*Justice McLean.*

### Base Ball at Hoboken.

EDITOR JOURNAL OF THE TELEGRAPH:

On Monday, July 12th, a nine composed of Western Union Telegraph Company's employees played a game of base ball at Hoboken, with the Orions. The score, at the end of the fourth innings, stood, Orions 16, Telegraphers 0. In the eighth inning the Telegraphers, by sharp play and heavy batting, scored 18 runs, and by scoring 5 more in the ninth innings, won the game. The score stood, Orions 27, Telegraphers 33.

Yours, resp'y,  
G. W. ROBERTS.

### Death of John L. Anderson.

**SUDDEN DEATH.**—We regret to learn of the sudden death yesterday, by congestive chill, of John L. Anderson, an able and well informed electrician, who had the superintendence of the batteries at the telegraph office corner of Main and Court Square. So expert was he as a repairer, that specimens of a peculiar mode of his in arranging "connections" were sometimes applied for from New York. On Friday last a number of the gentlemen of the office joined the Mutual Insurance Association that has recently been organized among the members of the telegraphic profession, and Mr. Anderson was fortunately one of them. He was much beloved among his acquaintances. He leaves a wife and child, and was a native of Switzerland.—*Newspaper.*

An article appeared in our last issue respecting this death which was the result of our absence from the city. Mr. Anderson, in company with 10 others, had applied for membership in the Telegraphers' Mutual Life Insurance Association, but the papers had not been received at the time of the telegraphic announcement of Mr. Anderson's sudden death. They were received the following day, and, in the case of Mr. Anderson, were deemed too late for the committee to act upon, and no certificate was issued. It has been claimed that the sending of the money, although not actually received, entitled Mr. Anderson's family to the benefit of insurance, but the committee have not been able so to regard it. Although this be true, we shall be glad to be the medium of the receipt of any sums which may voluntarily be sent us for Mr. Anderson's family, and which we recommend to all operators in or out of the Association as a brotherly act worthy of their attention.

The committee has no money except as it is given to them, and the refusal of the committee to send a certificate to one certified as dead, need not hinder a dollar from coming to his family. The committee only claim that, under the circumstances, they can not exclude from membership those who do not remit.

### Wonders of Minute Workmanship.

In the twentieth year of Queen Elizabeth, a blacksmith named Mark Scaliot, made a lock consisting of eleven pieces of iron, steel, and brass, all of which, together with a key to it, weighed but one grain of gold. He also made a chain of gold consisting of forty-three links, and having fastened this to the before mentioned lock and key, he put the chain about the neck of a flea which drew them all with ease. All these together, lock and key, chain and flea, weighed only one grain and a half. Oswaldus Northingerus, who was more famous even than Scaliot for his minute contrivances, is said to have made sixteen hundred dishes of turned ivory, all perfect and complete in every part, yet so small, thin and slender, that all of them were included at once in a cup turned out of a pepper-corn of the common size. Johannes Shad, of Mitalbrach, carried this wonderful work with him to Rome and showed it to Pope Paul V, who saw and counted them all by the help of spectacles. They were so little as to be almost invisible to the eye. Johannes Ferrus, a Jesuit, had in his possession cannons of wood, with their carriages, wheels, and all other military furniture, all of which were also contained in a pepper-corn of the ordinary size. An artist named Claudius Gallus made for Hippolytus d'Este, Cardinal of Ferrara, representations of sundry birds sitting on the tops of trees, which by hydraulic art and secret conveyance of water through the trunks and branches of the trees, were made to

sing and flap their wings; but at the sudden appearance of an owl out of a bush of the same artificer, they immediately became all mute and silent.—*World of Wonders.*

### Base Ball.

About a fortnight ago the Night Owl Base Ball Club made a trip to Oxford, Ohio, where they played the University Club, of that place, which, by the way, is one of the strongest clubs in the State. The Owls were so badly defeated that a nine composed of clerks from the extensive dry goods establishment of Hopkins & Co., in this city, thinking they would achieve an easy victory, challenged the Owls to a game, which came off on the morning of the 5th, at the Iron Slag grounds in this city. Smarting under their defeat of the week before, the Knights of the Key went in to win, and win they did by the large score of 70 to 11. Of the individual play upon the occasion Gould and Webb at 1st and 2d base particularly distinguished themselves, the former capturing nine prisoners in good style. Kern, in the sixth inning, made a neat double play, taking a high fly from Bradshaw's bat, and touching Buhler ere he could return to his base. Williams, in his new role of pitcher, was very effective and regular throughout. The following is the score:

NIGHT OWLS.	O. R.	PICKED NINE.	O. R.
Gould, 1b.....	3	Robertson, c.....	3
W. Baker, lf.....	2	Brewster, ss.....	0
Spink, c.....	2	Mason, lf.....	1
Williams, p.....	2	Higgins, p.....	4
King, 3b.....	2	Buhler, of.....	0
Kern, ss.....	1	Bradshaw, 2b.....	2
Scott, cf.....	2	Starritt, 1b.....	3
Welsh, rf.....	4	Kestep, 3b.....	0
Webb, 2b.....	1	Lothman, rf.....	3
	21		31

#### INNINGS.

	1.	2.	3.	4.	5.	6.	7.
Night Owls.....	2	9	22	0	7	15	15—70
Picked Nine.....	1	6	1	1	0	2	0—11
Out on bases—By Gould, 9; Webb, 1; Kern, 1—Total, 11.							
Assisted by Webb, 8; Kern, 2; Williams, 2; King, 1; Gould, 1.							
By Starritt, 3; assisted by Kestep, 1; Robertson, 1; direct, 1.							
Flies caught—Kern, 1; Spink, 3—Total, 4. Brewster, 2; Higgins, 3—Total, 5.							
Foul bounds caught—Spink, 4; Robertson, 10.							
Catches on Strikes—Spink, 2; Robertson, 3.							
Umpire—E. C. Ulrich, Buckeye B. B. Club.							
Scores—Messrs. Peirce and Britt.							
Time of game—2 hours and 45 minutes.							

On the 7th the Night Owls played a close game with the Red Stockings, Jr. Score by innings as follows:

	1.	2.	3.	4.	5.	6.	7.
Night Owls.....	2	4	0	3	4	0	0—13
Red Stockings, Jr.....	0	1	3	8	1	0	3—18

We leave for Cowes, Ohio, to-morrow morning, to play the North Bend Club, whom we met and defeated twice last year. I will send the score in my next.

VOYAGEUR.

**TELEGRAPH WIRE.**—A. Cary, assignor to American Telegraph Wire Co., New York city.—June 15. The gist of this invention lies in a telegraph wire having a steel core with a strip or strips of copper or other good electric conductor applied thereto, and soldered in place by means of a bath of tin. The same parties patent also, on June 15, a machine for making compound telegraph wire, the essential features of which consist in the combination of a device for folding the sheathing upon the wire with the device for drawing the compound wire, and also in a method of making telegraph wire by twisting about the common wire a sheathing of metallic ribbon and drawing them both through a metallic die.

### Science and Art.

A striking instance of the immense value that a small piece of steel may acquire by the great power of skilled mechanical labor, is the balance-spring of a watch. From its extreme fineness and delicacy, four thousand weigh not more than one ounce, and exceed in value £1,000, or \$5,000 in gold.

### SAMUEL C. BISHOP,

Successor to

THE BISHOP GUTTA PERCHA COMPANY,

The Original and Only Manufacturer in the United States of every description of

PURE GUTTA PERCHA GOODS.

INSULATED SUBMARINE TELEGRAPH CABLES.  
INSULATED TELEGRAPH AND ELECTRIC WIRE.

The Insulation of Telegraph and Electric Wire with Gutta Percha has been adopted by the manufacturers of these articles, in Europe as well as here, and in an experience of over TWENTY YEARS has never failed.

I also Manufacture

WATER, BEER AND SODA PIPE,

CHEMICAL VESSELS,

GUTTA PERCHA SHEET OF ALL THICKNESSES,

TISSUE SHEET FOR HAT AND CAP MAKERS' USE

COTTON AND SILK COVERED WIRE,

BRIDGE'S ELECTRIC CORDAGE,

BISHOP'S COMPOUND CORDAGE, &c., &c.

FACTORY, 422, 424, 426 EAST TWENTY-FIFTH STREET.

OFFICE AT FACTORY.

SAMUEL C. BISHOP.

WALTER O. LEWIS, Esq.,

Electrician of the Company.

### Brooks' Paraffine Insulator.

CHICAGO AND N. W. RAILWAY CO. TEL. DEPT.,  
CHICAGO, June 14, 1869.

DAVID BROOKS, Esq., Philadelphia, Pa.:

DEAR SIR—It is a pleasure for me to add what little weight my testimony may have upon the merits of your insulators. We have one line between Chicago and Milwaukee (85 miles), insulated with the old style, of three years' standing, which has done us excellent service. We have one with the new between Chicago and Jamesville (91 miles), that has been up a year and a half, never failing us. It is immaterial whether the weather be rain or shine, so far as its working is concerned. These are short circuits, and do not show the good qualities as strongly as longer lines, but they demonstrate the superiority of your insulator over the Wade or plain glass, there being wires of this description over the same poles, with which frequent comparative tests have been made, greatly in your favor. The cost of repairs on these two lines have been very small, proving the economy of your insulator in actual outlay within a few years, if the quality of insulation was no consideration. I can heartily commend your insulators to the telegraph fraternity.

Yours truly,

Geo. H. Bliss.

The *Scientific Review* says that a project for the formation of a society for the exploration of China is being actively promoted in Belgium, with a view to the introduction in the Celestial Empire of railroads, telegraphs, and the development of its mineral wealth. The project is very favorably viewed by King Leopold, who has traveled in China.

## Journal of the Telegraph.

## Miscellany.

## The Home of the Lepers.

THE LEPER COLONY OF MOLOKAI IN THE SANDWICH ISLANDS—HORRORS OF THE DISEASE—DANCE OF DEATH.

A Hawaiian correspondent of the San Francisco *Bulletin* gives the following description of the home of the lepers, on the north coast of Molokai: The low peninsula on which the colony is located is about three miles broad, spreading a couple of miles into the sea, and is so completely isolated that it is an appropriate and secure retreat for the poor victims of leprosy. A rough sea breaks continually upon a wild, forbidding coast. At the back an almost perpendicular wall towers to the height of 3,000 feet. There is but one avenue of approach by land—a narrow, zig-zag trail, cut in the face of this wall. The leper is indeed banished out of the world, and forgotten of men. Every island in the kingdom is haunted with the miserable victims, so terribly branded that no artifice can mask their deformity. Leprosy is not swift in the work of destruction. One may live 15 or 20 years, growing slowly but surely worse the whole time. Its first symptoms are almost imperceptible; it is therefore difficult to pronounce on some of them. There is a thickening of the lobe of the ears, swelling of the hands and feet, paralysis of the arms and fingers, ulceration, etc. There is a deadly look in the eye which can hardly be mistaken. With all these dreadful signals of doom there is no pain. The senses are benumbed. The worst features of the disease are an unhealthy appetite and a complete demoralization, the passions becoming almost ungovernable.

The Chamber of Horrors is filled with a dozen or fifteen recumbent figures, among the worst of the bad cases. A fetid odor, faint but perceptible, pervades the apartment. We hear hard, hoarse breathing, harsh whispers, and deep sighs from those who can never again speak with their old voices. The decay of the vocal organs is almost the last stage of the plague, and seems the most terrible of all. The patient is usually by this time one mass of corruption. Faces are turned to us, as we grope among the half-conscious sufferers, that look as though they had been hacked twenty times across with a broad ax, and each gash healing, had left a horrid seam. Ears swollen to twice their natural size, raw-looking and bloody, while the enormous lobes, hanging nearly to the shoulder, ooze with a sickening pus. There are those with nostrils slowly withering away, some with no nasal at all, only an ulcerous cavity remains, too abominable to be thought of for a moment. Fingers grown sharp at the end, sloughing the skin, shedding the joints one by one. This man can lay hold of and remove a toe without any sensation. What is it that so paralyses the sensibilities? Nothing but death itself, grasping the vitals. They are but half alive, these lepers, and carry their own infectious corpses about with them. One old man, sitting in a malo, a narrow strip of cloth bound about the loins, is covered from head to foot with large, hard swellings. There is not valley enough between his thousand-and-one fleshy hillocks to lay the tip of your finger. Yet he is unconscious of any pain whatever. He turns a ghastly grin—supposed to be a smile—upon us, as he exhibits a new mound, just making its appearance on one side of him, which is likely to crowd out a few of the older ones. The poor wretch looks more

like a horned toad, polished down a little, than a man and a brother.

Once upon a time these decaying remnants of humanity deliberately gave a grand ball at the hospital. There was a general cleaning out of disabled patients, and a brushing up of finery, while the ball itself was the great topic of conversation. Two or three young fellows, who had a few fingers left, began to pick up a tune or two on native flutes made of bamboo. The lamps flamed in the death chamber of the lazaret house. The wheezing voices, the shuffling of half-paralyzed limbs over the bare floor, the wild sea moaning in the night, made the scene unearthly.

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by the

BISHOP GUTTA PERCHA COMPANY, OF NEW YORK,

General Agents for the sale of any articles manufactured by them

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at the Company's prices in New York.

The long experience of this Company (and that of Mr. SAMUEL C. BISHOP, its immediate predecessor) in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation they have gained and enjoy for the superior quality and perfection of manufacture of their

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with the Bishop Gutta Percha Company, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, falling to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

CHESTER, PARTRICK & CO.,

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

88 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

### IMPROVED TELEGRAPH WIRE.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

### THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

### THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

### GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

### THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

IMPROVED TELEGRAPH INSTRUMENTS.

Having adopted the use of

OREIDE METAL,

which is much richer and finer than brass, he now presents his work in a style and of a quality that are unsurpassed.  
His Relays were awarded

THE FIRST PREMIUM

at the late Great Fair of the American Institute, N. Y., and their superiority is generally acknowledged by operators who use them.

Aside from the advantages apparent upon inspection of these magnets, their acknowledged merits consist in the construction of the *Helix*, which was patented August 15, 1865. This being of naked copper wire, so wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In helices of silk insulated wire the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

## PRICES.

Relays with helices in bone rubber cylinders, very fine.....	\$19 50
Small Box Relays.....	16 00
Same in Rosewood.....	17 00
Medium Box Relays.....	17 00
Same in Rosewood.....	18 00
Large Box Relays.....	8 00
Main Sounders same as the above, with heavy armature lever, without local connections.....	75 cents less
Pocket Relays, with all the adjustments of the above and good Lever Keys.....	22 00
Excellent Registers.....	40 00
Pony Sounders.....	6 75
Keys.....	6 50

All other appliances made to order. Extra spools for replacing such as may be spoiled by lightning, furnished at \$1.25 each. Old spools taken at the price of new wire by the pound. Goods sent to all parts of the continent with bill C. O. D. Or, to save expense of return, funds by express remittance may be made in advance by certified check payable in New York, or Post-office orders, in which case he will make no charge for package.

He has ample facilities for furnishing all other kinds of Telegraph Supplies at the lowest manufacturers' prices.

**DURANT'S**

NONPAREIL RELAY.

PATENTED MAY 19, JUNE 30, AND DECEMBER 8, 1868.

This Instrument, having been thoroughly tested on the principal Telegraph Lines in this country, is now offered for sale. It has proved itself a practical

SELF-ADJUSTING RELAY

under all ordinary conditions of the circuit. It will be found especially valuable in

RAILWAY TELEGRAPH OFFICES,

where the operator, being frequently otherwise employed, cannot be in constant attendance upon his instrument.

THE BUNNELL REPEATER,

by the use of this Instrument, is rendered practically Self-adjusting, entirely obviating the annoyance frequently arising from the inattention of operators at repeating offices.

THE NONPAREIL RELAY

is finished in a manner superior to any other instrument in the market.

The parts of the Instrument are

MADE INTERCHANGEABLE,

so that a duplicate of any portion can be furnished at any time.

These instruments are now made with the sliding bolt insulated from the armature-lever, and a continuous wire connection between the platinum point and the lever.

The ordinary resistance of this Relay is equal to about Twenty-five Miles of No. 8 Iron Wire.

Relays of any required resistance will be made to order.

PRICE, \$30.

THE USUAL DISCOUNT TO DEALERS.

Mr. Geo. E. Seibert, Western Union operator, 145 Broadway, New York, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a self-adjuster in every respect."

For a full description of the construction and advantages of this Instrument, see JOURNAL OF THE TELEGRAPH OF Dec. 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office order, will save the expense of returning funds by express.

Agent for the sale of the Nonpareil Relay on the Pacific Coast, Mr. STEPHEN D. FIELD, San Francisco, Cal.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET,

PHILADELPHIA.

The guarantees of this insulator are:  
1st. A current resistance in rain or fog, or in rain and fog combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an substantiated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.

# JOURNAL OF THE TELEGRAPH.

VOL. II. NO. 17.

NEW YORK, AUGUST 2, 1869.

WHOLE NO. 42.

## The Song of the Telegraph.

I have heard men say that when winds were high,  
And clouds were tossing about the sky,  
Journeying over some lone morass,  
Where the endless wires of the telegraph pass,  
They have stood, and listened, and trembled with fear,  
The song of the telegraph to hear.—  
A sad and most unearthly strain,  
A sharp, low moan, like a soul in pain,  
Rising and falling fitfully,  
Like the long waves after a storm at sea.  
I have thought and wondered many a time  
What the wire would say, could it speak in rhyme;  
And thinking much, and wondering long,  
At length have found the telegraph's song.

Lo, the golden age has come!  
Light has broken o'er the world!  
Let the cannon mouth be dumb,  
Let the battle flag be furled!  
God hath sent me to the nations,  
To unite them, that each man  
Of all future generations  
May be cosmopolitan.

I, the lightning—the destroyer—  
I, the untamable, the proud—  
To be harnessed to the wire,  
I have left my thunder cloud.  
Harbinger of peace and union,  
Messenger no more of wrath,  
To establish sweet communion,  
Down to earth I take my path.

With the olive branch extended,  
Swift I go to every shore;  
Soon all nations shall be blended,  
They shall learn of war no more.  
Peace and progress be forever  
Printed on the hearts of men,  
So that future time may never  
See a battle field again.

## Injury to Prof. Morse.

The friends of Prof. Morse have been made quite anxious by a serious injury which happened to him a few days ago, and many inquiries have been made respecting it. We give the following message, addressed to us, to show how cheerfully and hopefully one on the verge of fourscore bears the breaking of his bones:

POUGHKEEPSIE, July 28, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

My hurt is the breaking of both bones of my left leg from a mis-step on the stairs. Tedious, but not painful to bear. Am doing well.  
SAM'L F. B. MORSE.

## The French Cable a Bond of Friendship Between France and America.

PARIS, July 26, 1869.

The *Journal Officiel* congratulates the country on the completion of the Franco-American cable. It says: "The new route of communication now opened between France and the United States will henceforth render our intercourse more frequent and our relations more intimate. It will draw closer the bonds of friendship which now unite the two countries."

## The French Cable.

THE EMPEROR OF THE FRENCH TO THE PRESIDENT—THE PRESIDENT'S REPLY.

The following dispatches were transmitted by the French Cable:

PARIS, 8:45 A. M.

*The Emperor of the French to the President of the United States:*

I am highly gratified to inaugurate the new line of telegraph which unites France with the United States by sending to you the expression of my good wishes for you and for the prosperity of the United States.

NAPOLEON.

*The President of the United States to the Emperor of France:*

I cordially reciprocate your good wishes, and trust that the liberal policy of the United States, pursuant to which the cable has been landed, may result in many such means of communication, especially between this country and its earliest ally and friend.

U. S. GRANT.

"The line of the French cable first starts in very shallow water from Minou Bay, but in four or five miles it deepens from 17 to 20 fathoms, and then gradually shelves from 30 to 60 and 90 fathoms; a depth which is pretty equally maintained over the whole bed of the English Channel. At this level, but on the whole gradually deepening, it continues till in line with the westernmost part of the Irish coast, where, taking a northern course, it passes down a gentle slope of sand, that continues descending till the depth increases from 200 to 800 and 900 fathoms, and then in a short distance to 1,700 fathoms. Over all the rest of the course to mid-ocean the bottom is mud, shells and sand, and with a uniform depth of about 2,000 and 2,200 fathoms. This course would have brought the Great Eastern close to the northward of the supposed gaunt spires of rocks called the 'Three Chimneys,' and which, as laid down in the Admiralty chart, were confidently believed to exist. Lieutenant Johnstone, in the course of his soundings, went over the exact spot where they are indicated in the chart, and found more than 2,000 fathoms of water, with deep water all around, and not the slightest trace of rock or shoal in any direction.

"From the locality of these fictitious pinnacles, the cable course is kept in a pretty regular depth of from 1,800 to 2,000 fathoms, and throughout over a soft bed of mud mixed with myriads of the most minute shells. These shells comprise various forms of *diatomacia*, which, though perfect in their organization, are so exquisitely small as only to be visible under the most powerful microscope. They are really as fine as flour, and the greater part of the bed of the Atlantic is covered with the *debris* of these animalculæ, the existence of which proves conclusively, what was long denied, that at these great depths there is an absolute cessation of all motion. Over such a bottom the line is taken in an arc of a large circle, the most southerly point of the cable being in 42 degrees north latitude, and the most northerly 48 degrees. Along the southern end of the Newfoundland Bank it is sunk in about 150 to 200 fathoms, the water on the Bank itself varying from 50 to 90 fathoms. Thus it is completely sheltered from the ice, which, if the ice-

bergs pass the bank at all, must clear the cable which lies under its lee by some hundred fathoms or more."

## Signaling on Board the Cable Fleet.

The London *Gazette* gives the following interesting description of the manner of signaling through the cable on board the Great Eastern:

The method of signaling used between the ship and the land is that now universally adopted in working all long submarine lines—the reflecting galvanometer. The principle of this most delicate instrument was discovered a few years since by a German electrician, named Weber. It was then, however, a large machine, and the condensation of all its powers into the smallest and lightest form is due to the scientific research and skill of Sir William Thompson.

This instrument consists of a small mirror with a magnet on its back. That the two are very small indeed may be judged by the fact that both together weigh less than three-eighths of a grain. This infinitesimally small reflector, which is intensely bright, is suspended by a silk thread as fine as a hair in the midst of a small circular coil of insulated copper wires. Directly a current is sent through this circular coil, no matter how slight, it induces another electric current within its circle, which acts in an opposite direction, and this causes the magnet at the back of the mirror to turn to the right or left, and of course, to turn the little mirror with its reflecting ray of light with it. By a very simple arrangement, this fine ray of light is thrown upon a horizontal graduated scale, about three feet long and three feet distant from the mirror.

Thus when a current is sent through the little circular coil round the mirror, the magnet is acted upon, and turns the mirror with its ray of light, say on the left of the scale in front of it. When the current is reversed, and that is instantly done by pressing a little key in the speaking instrument, the current in the circular coil is reversed and sent in the opposite direction, and this in turn sends the ray of light from the mirror on to the opposite side of the scale to the right. When the ray of light rests stationary on any part of the scale, it means a dot; when it moves rapidly to the right or left, it means so many dashes, according to the distance it goes. This reflecting galvanometer tells with unerring certainty whether or not the Great Eastern is steady.

The vessel now at the end of the cable is, with its coils of insulated wire and iron hull, a mere electromagnet so to speak. The course of the Great Eastern is east and west, and therefore at right angles with the course of the magnetic current, which is north and south. Thus every time the ship rolls, either to port or starboard, a slight current, but still a current, is induced in her vast coils, and thence transmitted through the cable to the shore end at Minou, where it acts upon the reflecting galvanometer, and turns its ray of light a little to the right or left of the centre of the scale, and thus shows in a fraction of a second of time the precise degree and rapidity at which the vessel is rolling.

## Electrical Tension—A Reply to Mr. Prescott.

NEW YORK, July 10, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

An article upon auroral currents appears in a recent number of your paper, from the pen of Mr. Geo. B. Prescott, in which he takes exception to a statement of my own, in an article published some weeks since in another journal, which was in the following words:

"All electrical currents are invariably caused by a difference of electrical tension between two points—and the passage of the current, as it is termed, tends to equalize these varying tensions. Under ordinary conditions, the current used in operating a telegraph wire is caused by the difference in electrical tension between the two poles of the battery employed."

Referring to the above paragraph, Mr. Prescott, in the course of his article, says:

"This statement is singularly inaccurate. The passage of the current has nothing to do with the difference in electrical tension between the two poles of the battery, for the tension is the same at one pole of a battery as at the other."

With all due respect to his opinions upon this matter, I fail to see that Mr. Prescott has brought forward any proof whatever in support of his somewhat remarkable assertion, that "the tension is the same at one pole of a battery as at the other." If, as he says, I "have inadvertently fallen into some errors that require correction," it is due to myself to say, that quite a number of other electricians of far greater ability have shared the same fate. We know that if a wire is connected from one pole of a battery to the other, a current of electricity will pass through it. How could this happen if the tension were the same at both poles? As a familiar illustration, suppose two reservoirs connected by a horizontal pipe, the water standing at the same height in each, and filling the connecting pipe. In this case, the pressure being equal at each end, the water in the pipe remains at rest. Take a quantity of water from one reservoir and add it to the other, and the equilibrium is disturbed. The pressure becomes less at one end of the pipe and greater at the other, and a current flows through the pipe until the equilibrium is again established. Now take the case of a battery, both poles being disconnected. Suppose the chemical action within the battery to be entirely suspended, the electrical tension at both poles would be the same as that of the earth, which is assumed to be zero. But when the chemical action takes place, the electric equilibrium is disturbed. The copper or platinum pole of the battery assumes a positive tension, and the zinc pole a negative tension, these tensions being equal but *opposite*. With 1,000 cells the phenomena of the attraction and repulsion of light non-conducting substances may be shown, as with a frictional electric machine, proving that there is actually an accumulation of electricity in a state of tension at each end of the battery, the tension at one pole being as much *above* that of the earth as that of the other pole is *below* it. The tension at the two poles is not "the same," any more than the magnetism is the same at the north and south poles of a magnet, or the temperature is the same when 50 degrees above zero than it is when 50 degrees below.

I find that the leading modern authorities upon electrical matters are inclined to view the matter under discussion in the same light as myself. Gavarret says ("Telegraphie Electrique," p. 35): "The poles of a battery, when disconnected, have equal but *contrary* tensions." Culley (*Handbook of the Electric Telegraph*, p. 10) says: "If both poles be insulated the central plates will be neutral, the zinc pole will leave a — tension of (say) 20, and the copper pole a + tension of 20." Latimer Clark says (*Resistance Measurement*, p. 23): "All electrical currents are produced *solely* by differences of tension," and again (p. 17), "The quantity of electricity flowing along any conducting wire, between two given points, is directly proportional to

the difference of tension between those points." C. F. Varley, in his *Report on the Condition of the Western Union Lines*, p. 73, gives a diagram showing the tension, or electro-motive force, upon a line with a battery at each end, and a closed circuit, on the American plan of working, which correctly represents the varying tensions in different parts of the line. The tension of the earth being considered as zero, the grounded pole of each main battery is zero, and there is a point on the line midway between the batteries which is also zero, one half of the line having a positive and the other half a negative tension, as long as the circuit remains complete. The greatest tension occurs at the points where the batteries are attached to the line, and it decreases gradually from that point to zero in the middle of the line. Therefore the greatest tension in the circuit is at one pole of the battery, while the other pole is at zero, this tension being positive in the case of one battery and negative in the case of the other.

I might go on and enumerate a dozen more authorities to the same effect, if it were necessary to sustain my position, but the foregoing ought to be sufficient, for the correctness of it seems to me to be almost self-evident. If, as Mr. Prescott contends, it is an error, I certainly did not fall into it through "inadvertence," neither, I think, did the writers above quoted.

While upon the subject I may remark that Mr. Prescott seems to have fallen into one or two slight errors on his own part. In his article he also says:

"I have never known an earth current to change from maximum positive to maximum negative in a shorter period than 60 seconds, and the change is often spread over an interval of several minutes."

In his work on the *History, Theory and Practice of the Electric Telegraph*, p. 319, the following statement occurs: "The waves (of the auroral earth current) occupy about fifteen seconds each ordinarily, but we have known them to last a full minute, although this is rare." It would appear as if at least one of the above statements was "singularly inaccurate."

Mr. Varley will also doubtless be somewhat surprised, in common with myself, to learn that the principle upon which his Atlantic cable condenser depends "is that of the gradual change in polarity of the earth currents." If the polarity of these currents remained *unchanged*, it is quite probable that the cable could still be successfully operated by means of the condensers. Or does Mr. Prescott mean that the polarity of the earth currents can be changed by means of the condenser?

In conclusion I may say that I have no reason whatever to doubt that Mr. Prescott's arrangement of wires, on the 15th of April, worked without the slightest interference from the auroral influence. The weather was clear and dry, and the conditions of insulation extremely good. Under less favorable circumstances some effect would probably have manifested itself. This, however, is a matter of little practical importance. Mr. Prescott's arrangement, in the majority of cases, perhaps in every case, will work as well as any other. With the prevalent conditions of insulation the metallic circuit is theoretically the best.

F. L. P.

PRIVATE TELEGRAPH.—An organization has lately been formed in this city, under the style of the "American Private Telegraph Company," which is a novel, and promises to be a highly important and useful, enterprise. Its object is to place business men in direct communication with each other, and connect their offices, stores, warehouses, residences, etc., so that at any moment word may be conveyed from the one place to the other. It operates on the principles of the police telegraph, and is so simple in its *modus operandi* that any person may learn it in a very short time.—*Chicago Times*.

## The Tides.

The power exerted by the tides every day along thousands of miles of sea coast is especially remarkable, as it is the only natural force directly dependent on gravitation, which owes nothing to the heat of the sun, itself a result of gravitation, and in its turn the cause of all other forces on the surface of our planet, either wind or water power, steam power or the power of animals.

To estimate the force of the tides, all that is necessary is the consideration that the attraction of the sun and moon (principally of the latter), acting in opposition to terrestrial gravitation, elevates the surface of a large portion of the ocean, nearly twice in twenty-four hours, to the mean height of about two feet. The extent of surface thus raised may be set down at 100,000,000 square miles, or one half of the surface of the earth, taking this at 200,000,000 of square miles, of which the ocean occupies about three fourths, or 150,000,000. Every square mile of water two feet thick, contains nearly 60,000,000 cubic feet, or 3,540,000,000 pounds of water, and this, multiplied by 100,000,000, the number of square miles affected by the tide, gives the enormous number of 768,000,000,000,000,000 foot pounds exerted every 12½ hours, or 75 minutes, which gives per minute a power of 100,000,000,000,000,000 foot pounds. Dividing this by 33,000 to reduce it to horse power, we obtain nearly 3,000,000,000 horse power as the total power of the tide wave over the whole surface of the earth.

The railroads of the world, at the close of 1868, are reported to have been in the aggregate 109,177 miles long. The comparative mileage of the different countries is given as follows: The United States 42,255; Great Britain, 14,247; France, 9,934; Prussia, 5,926; Russia, 4,317; and Italy, 4,109. The total for Europe is 56,660. Asia has 4,474 miles; South America, 1,424; Australia, 789; Africa, 583.

It has been observed that wires which have for a long time transmitted electricity, have their texture changed and are rendered brittle. In this observation, however, though made by a skillful electrician, M. Peltier, the effects of exposure to the atmosphere, to changes of temperature, etc., have not been sufficiently eliminated to render it worthy of entire confidence.

## Remarkable Cure from Lightning Stroke.

Mrs. E. Stahl, who lives on the "South Hill," is Bloomington, recently received a striking benefit from a stroke of lightning. She has for a long time suffered from heart disease, superinduced in great measure from the anxieties and mental sufferings caused by the war. She had six sons in the army at one time. She also had suffered from a broken foot, and has not been able to move about, except by the aid of a cane. For a year past she could not reach a neighbor's house unassisted. On the 29th of May a heavy thunder storm passed over this town, and while Mrs. Stahl was standing in the door of her cook house, she received a severe shock from lightning, which she describes as like the blow from the flat side of a board on the top of her head. An iron rod six feet long was standing near her. She would have fallen, but was caught in the arms of her son. The shock was followed by nausea, and much bodily prostration for four or five days, and serious consequences were feared by the neighbors. She finally recovered entirely, and greatly to her surprise, her bodily health is entirely restored, and she is now able to walk without a cane. Her lame foot is entirely well. Those who are incredulous or curious can verify the truth of these facts by inquiring of Mrs. Stahl personally.

**Wedlock.**

**WEDLOCK; OR, THE RIGHT RELATIONS OF THE SEXES.** Disclosing the Laws of Conjugal Selection, and showing who may and who may not Marry. By S. R. Wells, author of "New Physiognomy." New York: Samuel R. Wells, Publisher. 1869. pp. 238.

Authors may talk of conjugal selection as they please, but there is only one way to go about it, or, rather, that men and women ever pursue. A man takes a fancy for a woman and marries her for no reason he knows of but the fancy. A woman does the same. You can't argue them out of it. Tell the woman the man is a brute, a villain, a thief, what you like, she'll go it blind and have him any way. So of him. Still good advice may stick on some sensible hides and we recommend them to "Wedlock." It is neatly got up and will be read as all such books are. Our philosophy of marriage is to love and wed. Genuine love will stand the test of time the longest.

**A Good Number.**

Wells' Phrenological Journal for August has the following among its varied contents: Rev. John P. Newman, D. D., Chaplain to the U. S. Senate; J. Edgar Thomson, President Pennsylvania R. R. Company; James A. Whitney; Henry J. Raymond; The Old North Church; The Wallachians; Small v. Large Heads; The Laughing Deacon; The Lyre Bird; The Phrenologist's Prophecy, or an incident in the Life of Metternich; Bible Experiences; Observations and Impressions of a day, or Reading Faces on the Rail; Marriage Customs, etc.; How to become a Christian; a well balanced mind; etc., with Portraits and other Illustrations. Price 30 cents, or \$3 a year. S. R. Wells, Publisher, 389 Broadway, New York.

**The Galaxy.**

The Galaxy improves with every issue. Its articles are brief, able, full of a cheerful interest which makes it an ever welcome guest. In the last number, amid many others of value and interest, is an article of unusual excitement which we must give in our next number although somewhat long. It is the story of a drunken telegrapher who caused the collision of two trains, and is told with much romantic skill.

**O. S. Wood, Esq.**

We have neglected to state that Mr. Wood, formerly General Superintendent of the Montreal Telegraph Company, whom all operators know by reputation, and all who know him personally admire and respect, has returned to Montreal, his former residence. This change was made chiefly with a view to restore his wife's health, which has long been delicate. The change, however, was fruitless, for on the 25th of June she died, much respected and beloved by a large circle of friends who mourn her loss. In this bereavement we sincerely sympathize.

We regret also to record the death of the wives of J. H. Purnell, Opelika, Ala., James Newell, New Orleans, and Bolling W. Starke, Raleigh, N. C. In the case of Mr. Purnell the loss was deepened by the death, soon after, of his interesting daughter Jessie. To all of them we extend sincere sympathy.

**The Dark Side.**

While we congratulate the profession on the general high character which distinguishes it, we have sometimes to acknowledge that its purity might be increased. There are no earthly gardens in which grow no weeds.

The last month's report of the Central Division shows the following dismissals:

For drunkenness and neglect of duty.....	1
For incompetency.....	1
For drunkenness and dishonesty.....	1
For drunkenness and inattention to business.....	1
Defaulter.....	1

For drunkenness in such a service as ours there is no excuse, and it should admit of no toleration. It absolutely unfits a man for his duties and none can properly be intrusted to him. We would gladly join in a united pledge of total abstinence to secure the service from the dishonor and injury of this evil element. Considering its unfitting qualities for the care needed in our business, we would approve rather than blame the test of total abstinence in making appointments.

**New Telegraph Line.**

The Dutchess and Columbia Railroad Company have just opened up a line of Telegraph along their road between Fishkill and Millbrook. The line was built by Mr. S. J. Burrell, and the design is to extend it to the State line of Massachusetts through Millerton. The railroad on which it is built is, as is well known, a part of the Boston, Hartford and Erie, terminating in Fishkill, opposite the village of Newburgh, and of which George H. Brown, Esq., is president. By the 15th of August the line will be open to Pine Plains, with the following offices:

Fishkill,	La Grange,
Fishkill Landing,	Millbrook,
Hopewell,	Bangall,
Arthursburgh,	Pine Plains.

All are now open except the two last.

**Anniversary of the Atlantic Cable.**

On Tuesday last, July 27th, the Atlantic cable, the pioneer of all subsequent successes in cable laying, completed its third year of service. In all that time there has been no interruption of communication for an instant. When the one cable failed the other was always ready.

A few weeks ago we published a table, showing the various reductions of tariff which had been made by the company, until on June 1, the charge was reduced to ten dollars, in gold. We claimed that its affairs had been managed with wisdom and liberality, and that it deserved the gratitude of the public on both continents. We repeat that sentiment now.

**TELEGRAPH SUPERINTENDENT.**—Dr. O. P. S. Plummer, who has been Superintendent of the Western Union Telegraph line from Portland to Callahan's, has had his jurisdiction extended to Marysville. The Doctor is an accomplished and popular gentleman, and one of the best electricians on this coast, and his friends will be glad to learn of his promotion.

**Brooks' Insulator and the C. P. R. R. Telegraph.**

A letter from F. L. Vandenburg, Supt., dated Sacramento, May 22, says:

"I worked my line on Brooks' Insulators from Promontory to Wadsworth, 550 miles, through heavy rain, clear of escape, when M. P. could not work to Corrin, 40 miles, through the same storm. They use glass and bracket."

**Dug Burnett.**

OMAHA, July 21, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

Dug Burnett has gone to the land where all good telegraphers wish to go. The last seen of him was in the act of waving his drenched handkerchief in a frantically soothing manner to the "boys," who stood weepingly gazing upon the manly form, leaving us for the "Golden Land." He leaves an interesting family to mourn his departure and hosts of friends to rejoice at his good fortune. Supt. Gamble couldn't do without him and we gave him up "sorrowfully," though cheerfully. Seriously, he is one of the best of men, and wherever he goes will carry with him the best wishes of the fraternity. E. F. Smith, late of Chicago, relieves him of his duties in this office. DRAKE.

**The French Cable.**

The London *Times* gives a long account of the laying of the French Atlantic Cable, from which we take the following details of interest:

"The shore end of the cable is laid from a place called Petite Minou. There are two Minous, about eight or ten miles above Brest. One is Minou, plain and simple, a mere grim chasm in the rock-bound coast. Petite Minou is a little semi-circular nook, open to the whole swell of the Atlantic from the west or southwest, and with such a surf breaking upon the sand that boats can rarely land there, even in the calmest weather. In fine weather this little indentation is covered with sand to a considerable depth. In stormy weather—that is to say, for about eight months of the year—the sand, it is stated, is almost completely swept away, leaving the rocks bare. From this little bay the shore end is laid at an acute angle with the line from which the swell generally sets in, but during the fine weather—that is, while the sand is there—it can do little or no mischief. In bad weather, however, when the sand is gone, and when the great waves hurl up blocks of stone weighing many tons on to the rocks, it cannot be denied that the cable, for more than a mile's length from shore, will almost daily be exposed to the risk of serious injury, and that, apart from the risk from stones, its constant chafing from side to side upon the rocky bottom must soon or later cut it through."

THE General Superintendent and American Managing Agent of the French Cable Company, is Mr. L. G. Watson of New York, assisted by Mr. R. T. Brown of London, who will have charge of the company's land lines. Mr. M. J. Gaines, formerly Consul General for the United States at Tripoli, but who for the past seven or eight years has been engaged in the telegraphic service of the Mediterranean, is to be the chief clerk in charge of the cable, with a force of about 12 electricians.

**Married.**

**VALENTINE—DE RIEMER.** In Milwaukee, Wis., July 18th, by the Rev. C. D. Helmer, of Chicago, Mr. Richard Valentine, Manager of the Western Union and North Western Telegraph Co.'s office, Janesville, Wis., to Miss Susie B. De Riemer of Milwaukee.

**Died.**

At Zanesville, Ohio, July 23, 1869, Laura Powless, wife of Jas. Newell, of the Western Union Telegraph office, New Orleans, aged 27 years.

### A New Insulator.

W. E. Simonds, of Hartford, Conn., has invented an insulator on the principle suggested in THE JOURNAL of June 1. A description has been sent us, but without cuts, which, however, are unnecessary. Beneath the bell of the ordinary glass insulator, and of such diminished diameter as to be inside of it, is affixed a cup filled with paraffine, which offers a successful obstacle to moisture passing from the stem to the wire. This is practically the whole of the invention. W. W. Smith, Esq., Vice-President of the Cincinnati and Indianapolis Railroad, has an insulator in use similarly formed. Its merit is in the retention of ordinary forms, and their strength, with the paraffine barrier, which is preserved in place even when melted by heat. We will refer to it again.

LAKE SHORE & MICHIGAN SOUTHERN RAILWAY,  
General Superintendent's Office,  
CLEVELAND, O., July 1, 1869.

Mr. Wm. Kline, Jr., is this day appointed Superintendent of Telegraph for this Company; Office, Toledo, Ohio.

CHAS. F. HATCH,  
Gen'l Sup't.

### The "Foucault" Cable,

FOR SUBMARINE, SUBTERRANEAN AND AERIAL LINES, AND  
FOR CONTROLLING INDUCED CURRENTS.

Our attention has been called to the above cable, which its inventor claims can be successfully used for all the above purposes. The validity of these claims has already been settled by practical tests, which show that, in practice, it is all that it has been stated to be in theory, and that the science of telegraphy has made greater progress towards perfection than it has done for years. We refer more particularly to land telegraphy, as on marine lines all has been done within the past ten years that could have been hoped for by the most sanguine. Yet, even for this purpose the inventor of this cable claims properties which will enable the present rate of transmission on long submarine lines to be increased two-fold. A number of conductors in long cables can also be used, the action of induced currents, which have hitherto had so great an influence in defeating rapid transmission, being under control.

The "Foucault" Cable was patented in France in 1867, with additional improvements in 1869. The patents for Spain, the United States and England were taken out during the present year, and are now pending for other European countries. It has been in constant use since 1867 on board the Trans-Atlantic Company's steamers Europe and Lafayette, plying between New York and Havre, in working Foucault's speaking telegraph, which is designed for and has been used with great success during the same time, in transmitting the orders of the officer of the deck to the man at the wheel, and in automatically registering the obedience to such orders by return signals.

The exposure which the cable has undergone on board of these vessels has shown that the material of which it is made will stand any ordinary extremes of atmospheric temperature without depreciation, and, indeed, thus far it has gained in conductivity. This has also been the experience of the present Atlantic cables, although from a different cause. Upon these vessels the cable has been exposed to much more severe tests than it possibly could have had upon the ocean's bed, as it was subject to all atmospheric changes—heat, cold, ice, snow, steam and salt water alternately covering it for longer or shorter periods. But none of these destroying influences have had any perceptible effect, and it is apparently more durable to-day than when it was first laid down. There is no reason to doubt that it will last for ten or twenty years as an aerial line, while when laid as a submarine

or subterranean line, it can scarcely be less than perfect.

The manner of constructing these cables is varied by the circumstances under which they are to be used, while the same general principle is carried out in all.

Subterranean cables have been usually completely honey-combed and all conductivity lost within a minimum of from three to six years. This has been the result at Berlin, Paris, London and other points where the trial has been made.

For aerial use properties are required which have never yet been secured, although many attempts have been made. Strength, flexibility, lightness, a freedom from atmospheric influences, so as to work at all times, together with the power to combine any number of wires in one cable without interference from each other by induced currents, are all needed. All these are secured by the Foucault cable.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

Fig. 1. Section of cable magnified. 1. Conductor of one or more wires. 2. Gutta percha, or other insulating substance. 3. Cotton thread. 4. Tin foil or other metallic substance. 5. Linen band, saturated with ceruse of lead and litharged or other oil. 6. Hemp, natural fibre or paraffined. 7. Coal tar, or other analogous substance.

Fig. 2. Conductors of copper wire No. 16, with a compound steel wire No. 8 in centre to give strength.

Fig. 3. Conductors all of compound wire, size 14; conductivity equal to No. 16.

Fig. 4. Conductors of triple copper wire, for flexibility; conductivity equal to No. 16.

### SPECIFICATION.

In making a cable of one or more conductors, I use, as conductors, single copper or other metallic wires, or I twist several smaller wires together, forming one conductor of the proper size.

I cover each conductor with a coating of gutta percha, or instead of gutta percha I form a composition of ceruse, or carbonate of lead, finely powdered, and mixed with litharged oil and sawdust to the proper consistency. I then cover the gutta percha, or composition already described, with a metallic conducting coating.

I use preferably a coating of plumbago applied by friction, or a coating of tin foil, or I wrap a small copper or other metallic wire in a long spiral around the gutta percha or composition. Any conductor, properly applied, will answer the same purpose.

This metallic surface or wire is connected with the ground at each end of the cable, or at any one point or points that may be required, to carry off the properly employ and control all induced currents of electricity.

Over this I wrap a cotton thread, completely covering the gutta percha or composition and the metallic conducting surface, formed as above described.

I then saturate a linen band with a mastic composed of ceruse or carbonate of lead, finely powdered and mixed with litharged or other oil, to a proper consistency, and I wrap the linen band so prepared around each conductor, already covered as above described, each turn of the band lapping over the previous turn.

The different conductors are then brought together and wrapped with the same band, and over all is wrapped a tarred rope, of the thickness desired, which is covered with a coating of coal tar.

Cables for submarine use may be afterwards removed as usual, with iron wires of a size suitable to the locality and the work which they have to perform.

### CLAIMS.

1st. The construction of a telegraphic cable in the manner and for the purpose herein described.

2d. A conducting surface for induction currents when applied to the outside of the insulating coating of each group of conductors, in the manner and for the purpose herein described.

3d. A band composed of linen, or analogous material, saturated with a compound of carbonate of lead and litharged or other oil, when arranged in a telegraphic cable, in the manner and for the purpose herein described.

4th. In a telegraphic cable, the construction of the coatings, formed of gutta percha or composition, the metallic conducting surface, the cotton thread, the band saturated with mastic, and the tarred rope, arranged in the manner and for the purpose described.

5th. As an insulating material, used in the construction of telegraphic cables, the composition, composed of carbonate of lead, or other similar substance, litharged or other oil, sawdust or other analogous fibrous substance, in the manner and for the purpose described.

### A Novel Electro-magnetic Engine.

"MR. H. M. PAINE, of Newark, N. J., has applied for a patent for a new application of electro-magnetism to motive power. Similar but expensive attempts have been made with unsatisfactory results. Mr. Paine claims that he has overcome all difficulties. His machine is rated at four-fifths of a horse power, and is capable of running sewing and other machines requiring small power; but the expense is about the same as a similar power from steam. By doubling the size, however, he says he would secure twenty horse-power at an expense of \$1 per day for running, the fuel being the acids and zinc consumed by the battery. The machine under notice occupies a space of thirty inches in both length and height, and is about ten inches wide."

We clip the above item from a New York daily paper. Twenty horse-power at an expense of \$1 per day is simply ridiculous; and Paine's "novel electro-magnetic engine" evidently belongs to the same category as "Paine's water-gas," about which so much idle noise was made some fifteen or twenty years ago.

—Am. Artizan.

## Scintillations from Scientific Authors.

BY MADISON BUELL.

Men admire the steam engine of Watt, and the calculating engine of Babbage, but how little do they care for the thinking engine of the Infinite Artificer.

We have reason to believe that heat and electricity are both modes of motion.

New matter is presented to us daily, and it passes away unrecognized.

The book of Nature which we have to read, is written by the finger of God.

The most delicate flower, the tenderest insect, continues in its species through countless years; always varying, yet ever the same.

The electrical condenser was invented by Voltaire. It was originally formed of a wooden disc, covered with green silk, and of a metal disc furnished with an insulating handle, and which is placed on the wooden disc. An experiment with this condenser was the origin of the discovery of the Voltaic pile.

The dip of the magnetic needle was discovered in 1576 by Normann.

The first European navigator who made use of the compass was Vasco de Gama, in his first expedition into India.

If we look at electricity, it has advanced, in the hands of the careful investigator, to the most extraordinary results: it approaches at the motion of his hand; bursts from the metal; descends from the atmosphere; surrounds the globe; it talks, it writes, it records; it appears to him (cautious as he has learned to become) as a universal spirit in nature.

A very important precaution is not to act upon a galvanometer with a current too powerful for the instrument, for the action of such a current would risk modifying the intensity, or even by inverting. The sensibility of the galvanometer is thus greatly altered, and we run the risk of afterwards committing errors, either in regard to the force or direction of the currents we may desire to appreciate. Those who have the differential galvanometer belonging to the Western Union Telegraph Company please take notice.

The quality of iron exercises a great influence over the power of the electro-magnet. It must be as soft as possible; old iron, and especially Swedish iron, is preferable to all others.

It is to a German philosopher, M. Schweigger, that we owe the original idea of the galvanometer in use at the present day.

The true reason of the difficulty in telegraphic insulation is in employing the earth as part of the circuit, and depends on the following law: "That each of the two bodies which we necessarily suppose insulated takes a part of the total electricity, *proportional to its own surface*."

There is one circumstance, independent of the chemical nature and the physical constitution of bodies, which renders them better or worse conductors: it is their degree of affinity for the humidity of the air. Glass, which is of itself a good insulator, easily becomes a conductor as soon as exposed to humidity; it attracts to its surface the aqueous vapors of the atmosphere; they form there a thin film of water, by which the current gradually passes away.

## Statistics of Telegraph Lines in Switzerland.

Switzerland has 2,404 miles of telegraph line, and 4,626 miles of wire. Cost of line per mile, \$175.99; cost of wire per mile, \$90.52. The materials used in the construction of these lines are as follows:

Lines with Iron posts.....	416 miles
" Chestnut posts.....	75 "
" Larch posts.....	158 "
" Fir (Injected) posts.....	626 "
" Common Fir posts.....	970 "
" Chestnut and Larch posts.....	57 "
" Larch and Common Fir posts.....	98 "
" Cables.....	9

2,404

The number of miles of line constructed in 1867 was 184; of wire 508. The amount expended for construction and repairs was \$32,307.66. The amounts expended are not given for the separate items, and only the average cost per mile of wire can be stated.

Upon existing lines (over a length of 244 miles of line) there were added 262 miles of wire, and 184 miles of new line were constructed having 246 miles of wire. The amount of line reconstructed during the year was 103 miles.

With the exception of the special wires forming a part of the International Telegraph System established at the Conference in Paris in 1865 (0.196 inches, about No. 6 Birmingham wire gauge, and the St. Gothard Line with wire of 0.157 inches, about No. 9 Birmingham wire gauge), the wire used on the Swiss Lines is 0.118 inches in diameter, about No. 11 Birmingham gauge. The weight per mile of No. 11 iron wire is 199 pounds.

In the United States no conducting wire of iron is used smaller than No. 9, which weighs 303 pounds to the mile, while a very considerable portion of the lines are constructed with No. 8 wire, weighing 376 pounds; and in some instances No. 6 wire, weighing 538 pounds per mile, is in use. The short distances over which the Swiss lines work enable them to use wire of this small size, but they would be comparatively valueless over the great routes traversed by the American lines. An examination of the statement of the different kinds of poles used in Switzerland will show that 1,904 miles, out of a total of 2,404 miles, are of larch or fir, neither of which would be regarded as suitable timber to construct the most indifferent line in the United States.

When the cheapness of labor in Switzerland is taken into account, together with the inferior quality of the poles, and small size of the wire, we are not surprised that the cost of building the lines does not average more than \$175.99 in gold per mile.

## A New (!?) Thermo-electric Battery.

Mure and Clamond have brought before the French Academy, as new, a form of thermo-electric apparatus, which seems to be an attempt to commit "flat burglary" upon our countryman, Farmer, of Boston (who had his apparatus at the French Exposition). It is pleasing to find that Edmund Becquerel at once perceived and pointed this out, on the occasion. The authors use, as their elements, iron and galena. Becquerel showed also that galena was used as long ago as 1823, by Cumming. He objects to the use of sulphurets altogether, on account of the obvious danger of such elevation of the heat as to alter their constitution, preferring unalterable metals and alloys. For his other somewhat extended remarks the original must be referred to; but his concluding paragraph has sufficient interest in this connection to demand space:

"The results obtained from this battery, which is interesting to science and of facile use, prove that thermo-electric batteries are not yet as economical as has been supposed. It is true that the heat produced

by the (gas) burner may be better utilized by the plan of putting a greater number of elements around the chimney (radially, as in Farmer's plan) but even then, as in all such apparatus, the portion of the heat which is utilized in the production of thermo-electric current is but a very small fraction of that which is communicated to the elements, the rest being lost by radiation, etc."—*Comptes Rendus*, Mai 31, 1869, pp. 1255-56.

H. W.

FRANK L. POPE has resigned his position as superintendent of the Gold and Stock Reporting Telegraph in this city.

T. A. Edison, of Boston, succeeds Mr. Pope in the above position.

Mr. Pope, like a wise man, thinks health worth more than money, and has started West to breathe the Superior air. When he returns he designs paddling his own canoe in some congenial occupation respecting which his shingle will be seen in due season.

Mr. Edison is like his predecessor, a man of genius and skill. Few men are better posted than he.

## An Extraordinary Man.

One of the most extraordinary cases of peculiar formation in the human body we witnessed a few days since at Connelly's Hotel, Mercer, in the person of a colored man, a stranger. It is hardly correct, perhaps, to call it a case of malformation, as the phenomena were entirely internal, the man presenting no unusual appearance whatever. The person, by some inward muscular power, which he cannot explain can shift the position of his heart at will. We went to see him, not believing more than half that we had been told, but were convinced in less time than it takes to write it. He requested us to satisfy ourselves that his heart was in the position usually occupied by that organ. Placing our hand on his breast we could feel its beating distinctly. He commenced a series of contortions with his abdomen, rolling it over and over several times. At the conclusion of this striking exhibition, we placed our hand upon a lump in his left side below his waist, and there was the heart thumping away as if nothing unusual was the matter. A few more contortions and the frisky organ passed across the abdomen, and on the right side kept up its work of throwing the blood through the system as regularly as if in its natural position. More contortions and it traveled back home, its course being easily traced under the skin till it passed under the ribs. The man then commenced a sort of rotary motion of the bowels, apparently turning them over several times, when we felt a complete set of ribs covering the abdomen, the regular set being in their usual place. Turning the bowels in the opposite direction the false ribs disappeared. On being asked if his parents had more children like him, he replied that he had a brother over six feet high, who could reduce his stature to something less than three feet. We believe him readily after having witnessed the above performance.

## Obituary.

Died in Raleigh, N. C., Saturday, July 17th, Mary Jane, wife of Bolling W. Starke, Manager Western Union Telegraph Company, aged twenty-five years. Mrs. Starke has been an invalid for three years, but during the past twelve months her health was so delicate as to be a constant source of anxiety and distress to her friends. Her sufferings were protracted and peculiarly severe, but she bore them with the most exemplary patience and fortitude.

A devoted husband, a tenderly attached mother, four little children and a numerous circle of friends and relatives are left to lament her early removal.

Blessed are the dead who die in the Lord!

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—  
JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, AUGUST 2, 1869.

### The President's Annual Report.

We promised our readers a synopsis of Mr. Orton's report read before the Annual Meeting of Stockholders of the Western Union Telegraph Company, on the 14th ult. We do so very briefly and yet with sufficient detail to convey with clearness the leading facts.

This being the first formal report presented to the Company since its consolidation with the other leading lines of the country, its introductory pages are necessarily historical. The vast number of companies, of which no less than 80 existed in 1851, with their short poor structures, their varied tariffs, the obstruction, loss of time, and incorrectness in the transmission of distant dispatches caused by repetitions from one line to another, was clearly narrated, and with which all intelligent minds, who have followed the history of telegraphic progress in America, are more or less familiar. In connection with this the argument for consolidation was stated, an argument fully and best answered in the success which has attended it.

The statistical portion of the report gives the following information:

The lines of the Company now extend from Plaister Cove, Cape Breton, to Indianola, Texas, on the Atlantic coast, and from Los Angeles to the Kishyox Fisheries, 800 miles north of New Westminster, British Columbia, on the Pacific. They occupy every State and Territory except Minnesota and New Mexico, and with the lines in these they have exclusive connections.

During the last four years the construction and reconstruction of lines has amounted to over 25 per cent. of the whole length of line owned by the Company.

New line built.....	8,372 miles.
New wire erected.....	16,454 miles.
Line reconstructed.....	13,803 miles.

The extensive lines formerly built from Omaha to Salt Lake, by way of Fort Laramie, along the northern branch of the Platte river from Fort Jefferson, and along the southern branch to Denver, have all been removed, and permanent structures have been built along the route of the Union Pacific railroad to take their place. From San Francisco, also, to Elko, in Nevada, new lines have been built, leaving only a gap of 220 miles between Elko and Promontory Point, where the Central and Union Pacific roads unite, to complete the construction of this new line along the entire route. Telegraphic communication be-

tween the two oceans may, therefore, be henceforth regarded as safe and reliable, the lines being now alike removed from the destruction of emigrant and Indian, as well as from the casualties incident to forest roads through vast reaches of uninhabited territory.

A number of lines, built originally for local service, have been reconstructed to serve as main lines in connecting large cities and distant places.

During the past year a vast amount of work of the most compensating character has been done, in a close and rigid inspection of the machinery and conductors of the line, the restoration and improvement of insulators, the painting of arms, the cutting out and soldering of wire joints, by which the business of transmission has been greatly facilitated and quickened, and the capacity of the wires enlarged.

The following is the property of the Company July 1, 1869, exclusive of real estate and stock interests:

Stations.....	3,469
Miles of poles.....	52,099
Miles of wire.....	104,584
Submarine cables.....	103
Sounders.....	2,607
Recording instruments.....	1,334
Relay magnets.....	3,807
Manipulating keys.....	4,180
Translating repeaters.....	132
Printing Instruments.....	19
Switch boards.....	710
Lightning arresters.....	1,666
Cells of main battery.....	14,929
Cells of local battery.....	7,210

The receipts of the Company have been as follows:

1866-7.....	\$6,568,925 36
1867-8.....	7,004,560 19
1868-9.....	7,305,923 99

The net revenue has been—

1866-7.....	\$2,624,919 73
1867-8.....	2,641,710 88
1868-9.....	2,744,353 99

or an average of about 6½ per cent. on the capital stock.

In the use of this revenue the Company have deemed it their duty to declare moderate but uniform dividends, to reduce the bonded debt, to increase the facilities for business, to reach the basis of a low and just tariff, and to employ the most skilled labor. In other words they have deemed it their duty to treat the property as a permanent investment, with growing necessities and wider work, rather than a property under a limited lease to be milked and killed.

During the past two years much attention has been paid to the tariff. The reduction of rates has been carried out as fast as practicable, not under the constraints of opposition tariffs, but on a carefully designed plan which would, on the one hand, afford a fair revenue, and, on the other, meet public expectation. In this as well as in contemplated reductions, over 3,000 offices will share, where there is no opposition. The charges to the press also have, in some cases, been reduced fifty per cent., and have been generally modified. A new system of tariffs is now about being inaugurated, based upon air-line distances, by which charges will be

made upon the actual number of miles between two offices measured in a direct line across the face of the map. This will reduce the general tariff nearly 15 per cent., and will, it is believed, be followed by good results.

In many cases the tariff will be reduced much more. This will be especially true of communication between the East and South and Southwest, where messages have had, sometimes, to pass over twice the geographical distance to reach their destination. Places adjacent yet connected by circuitous lines will also feel the advantage of this new system which thus equalizes the charges throughout the entire country.

Were there an entire absence of opposing lines, the effect of which is, usually, to deplete the revenues and increase expenses, the reduction of the tariff could be made more radical and satisfactory.

During the past year there have been 363 new offices opened on the lines of the Western Union Telegraph Company, being more than the entire number of offices now open by all the competing lines.

During the past year 6,000 miles of wire have been added to the property and facilities of the Company. At this rate of progress, the property of the Company in ten years will exceed 165,000 miles of wire, and the number of offices be about 7,000, erected and opened from current revenues, enlarging by so much the sources of income, and increasing the value of the general property and stock.

On the subject of the valuation of the Company's property several modes of estimates are given.

Assuming a stock earning 10 per cent. to be worth par, as the Western Union stock is now earning 6½ per cent., the value of the stock with its present revenues should be 65. That 2½ per cent. is used in adding to the Company's property does not detract from the fairness of the valuation even if 10 per cent. be insisted on as a basis of par value.

Based on the valuation of English lines the value of the Western Union Telegraph Company's lines would be \$37,500,000 in gold.

Based on the average valuations of European lines the value would be \$31,000,000 in gold.

Based on the proposed purchase of English lines the value would be \$56,000,000.

Mr. Orton believes that the circumstances and prospects of the Company warrant him in assigning a present value to the stock of the Western Union Telegraph Company far above its present rates.

The report terminates with a statement of the condition of other companies, and their influence upon the prosperity of the Company he represents. Of this portion of the report we need only say that he proves that, while of necessity their existence limits to the extent of their depletion of the general receipts for telegraph transmission, the ability to effect more radical reductions of tariff, they cannot be regarded as permanent or serious obstacles to more enlarged success.

The point in the report to which the attention of stockholders will be strongly directed, will naturally be the immense work of construction and reconstruction of lines, which have been carried on with the

earnings of the Company. It will be felt at once that could these be discontinued the profits of the Company must be largely increased, and the value of its stock enhanced. Is it necessary? Will it continue? are questions ever ready on the reader's lips. Let us add a word on this point, for it touches the life and future of the Company.

First, let it be said that the cost of this class of work is not so great as the length of the structures would indicate.

In the work of constructing new lines, the money is, to some extent, derived from the population they reach, in subscriptions which are restored by the use of the lines thus erected. In other cases they are built by the co-operation of railroad companies, who bear a share of the cost and supply a portion of the labor. In this way the work of construction is constantly adding valuable property with comparatively small outlay. Yet, did they cost the Company twice as much as they have, the work is essential, if the general property is to maintain its value, and the Company perform its public duty. In doing this it accumulates strength. Where a population needs the telegraph, and it hesitates to provide it, the invitation is at once given to other interests to enter.

In the work of reconstruction there is also this to be borne in mind: that the work is largely accomplished by the regular forces of the Company. During the summer and fall all the regular repair force can sometimes be safely detached to perform this work, and it is largely done in this way. It is a work which tells immensely on the acceptability of the Company in the performance of its public duties. The time has now come when delays by feeble structures are impatiently endured, or, rather, are unendurable. The lines, therefore, have to be kept in the highest state of efficiency to maintain the standing they have attained. It is the policy of economy, it is the policy of power, it is the policy of successful resistance to opposition, to extend the lines wherever populations need their aid, and to keep the whole fabric, which now spans so vast a space, in the highest possible condition of working capacity.

#### Cable Celebration.

The successful completion of the French cable between Brest and Duxbury, was duly celebrated at the latter place, on Tuesday, July 27th. About five thousand people were present, and six hundred guests sat down to dinner under a mammoth tent provided for the occasion. Speeches were made by Mayor Shurtleff, of Boston, Sir James Anderson and others, and all was "merry as a marriage bell."

It is singular that the day chosen for the celebration, was the third anniversary of the opening of the Atlantic cable, which has so well performed its part in the intercourse of the two worlds.

THE Secretary of the Treasury has admitted the French cable free of duty.

A FAULT has been discovered in the Atlantic cable of 1866, one hundred and thirty miles from Valentia.

#### TARIFF BUREAU.

##### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
AUGUST 1, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since July 15th, the date of the last tariff order. Please note them in your tariff books:

##### NEW OFFICES.

Amazonia, Mo., offices having Caton map will use map tariff, all others will add 115 to their rate to St. Louis, 150 to Chicago or 75 to Omaha, taking for their rate the lowest amount found after adding as directed.

Avondale, Pa., tariff same as Kennett's Square, Pa.  
Chittenango Springs, N. Y., summer office, tariff same as Chittenango Station.

Cornwall, N. Y., reopened, tariff same as heretofore.  
Dalton, Ill., tariff same as Lansing, Ill.  
Espyville, Pa., reopened, tariff same as Linesville, Pa.  
Ft. Benton, Montana, 3.00 more than Salt Lake City, Utah.  
Fertis, Ill., tariff same as Elvaston, Ill.  
Hillsborough, N. B., reopened, tariff same as heretofore.  
Laurel, Del., tariff same as Seaford, Del.  
Montgomery, White Sulphur Springs, Va., tariff same as Christiansburg, Va.

Mokena, Ill., offices having Caton map will use map tariff, all others will make tariff same as Joliet, Ill.

Missouri River, Iowa, tariff same as Council Bluffs, Iowa.  
Mt. Carmel, Pa., on and after August 1st, will be a Western Union office. Tariff 30c. more than rate to Mauch Chunk, Pa., or 35 c. more than rate to Philadelphia, unless otherwise directed by Supt.

Otsego, Mich., tariff same as Kalamazoo, Mich.  
Plainville, Mich., tariff same as Kalamazoo, Mich.  
Struthers, O., tariff same as Youngstown, O.  
Townsend, Del., tariff same as Middletown, Del.  
Westville, Ind., reopened, tariff same as La Croix, Ind.  
Zilwaukee, Mich., tariff same as Saginaw, Mich.

Argenta, Nev.,  
Carlin, Nev.,  
Elko, Nev.,  
Winnemucca, Nev.,  
Tariff to these offices from points East of Omaha, same as San Francisco.

##### NEW OFFICES ON OTHER LINES.

Allegheny, Va., tariff same as Millboro, Va., or 75 and 5 from Richmond, Va. Check Richmond.

Greenwood, N. Y., tariff same as Turners, N. Y.  
Huguenot Springs, N. Y., summer office, tariff 35 and 3 from Roundout. Check Roundout.

Somesville, Me., tariff 35 and 2 from Ellsworth, Me. Check Ellsworth.

South West Harbor, Mt. Desert, Me., tariff 40 and 3 from Ellsworth, Me. Check Ellsworth.

Oromo, Ont., and Port Darlington, Ont., tariff 35 and 2 from Buffalo. Check Buffalo.

##### OFFICES CLOSED.

Nyack, N. Y., Wilmot, N. B., and Hyde Park, Pa.

##### GENERAL INFORMATION.

In last JOURNAL tariff to Van Deusenville, Mass., was given "same as Barrington, Mass.," it should have been Great Barrington, Mass.

WILLIAM ORTON, President.

#### Executive Order No. 78.

##### EXPRESS BUSINESS.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
JULY 22, 1869.

ANSON STAGGER,  
THOS. T. ECKERT,  
JOHN VAN HORNE,  
Gen'l Superintendents.

This Company has ceased to do business free for the following Express Companies and Dispatch Lines, viz.:

United States Express Company,  
Great Western Dispatch,  
American Merchants' Union Express Company,  
National Express Company,  
Merchants' Dispatch,  
Peoples' Dispatch.

And these Companies now charge for all service performed for us. This arrangement went into effect July 1st with the United States Express and Great Western Dispatch, and July 15th with the other Companies above named.

This business will be governed and accounts adjusted by the following

##### RULES.

All messages forwarded by any officer, agent or employe of the foregoing Express and Dispatch Companies, must be paid for by the sender at full commercial rates.

Each office of this Company will forward, with the monthly account current (Blank No. 4), a statement showing amount received during the month from each of these companies.

In settling accounts with railroad companies which share receipts with this Company, and with employes who receive for salary the whole or a part of the receipts, the amount received for express business must first be deducted. This is necessary to avoid loss to this Company, inasmuch as we account to the express companies for these receipts, and our net income is not increased thereby.

Express matter will be forwarded as heretofore without prepayment, but upon every package must be stated the amount of the express charge. The several companies will make up a monthly account against this Company, for all service rendered, which will be paid by our Treasurer at New York.

To audit accounts against this Company it will be necessary for every district superintendent to keep an accurate record of all express matter forwarded from every point in his district. This record must show date, from whom and place, to whom and place, and express charge upon each package. Packages forwarded to the President, Treasurer, Auditor, Supply Agent or other officer at New York, will not be entered, account thereof being kept in New York. This record must be made up promptly at the end of each month, and forwarded to the Auditor.

Every package, not containing money, upon which postage will amount to less than one half express charges, must be sent by mail. Money packages, containing currency or coin, must in all cases be sent by express. Checks, drafts and bills of exchange to the order of the Treasurer, must be sent by mail.

Business franks held by agents and employes of these companies have all been superseded by this arrangement and will be treated as cancelled.

Please instruct your superintendents and offices to make up accounts in accordance with this order, beginning with July.

WILLIAM ORTON, President.

#### A Challenge.

The Night Owls having noticed with great pleasure the recent victories of the New York Telegraph Base Ball Club, and desiring to create an interest for the national game among telegraphers in general, hereby challenge the New York club to a game of base ball, the game to be played in Buffalo, N. Y., at as early a date as convenience will permit.

The Night Owls will also be pleased to meet any other nine composed of telegraphers in the country.

A. F. GOULD,  
Sec'y N. O. B. B. C.

### The Telegraphers' Insurance Association.

There are now connected with the organization over 500 reliable members. The number of certificates issued is 575. Applications are received daily. They come from almost every State, North, South, East, West. Many of the large cities have enrolled their entire staff. New York, Nashville, Indianapolis, Cincinnati, Buffalo, Richmond, Mobile, Memphis, Albany, Troy and others, have entered every man in service. It is a little curious to notice that a large influx of names always succeed the notice of a death.

Is it fear or sympathy which thus stimulates attachment to an organization which has accomplished so much good? We think it is both. The fact of leaving one's family desolate and penniless, of burial by charity, is a just one. It should drive hundreds more to a like resolution. Sympathy, however, has largely to do with many applications. Their money is sent to meet cases of possible distress, without special thought of themselves. Telegraphers are not the dead dissolute men they have sometimes been called.

The promptitude of the payment of calls is very gratifying. Some send the instant a death is heard of. Many send letters we would be glad to publish could we do it without hurting sensibilities which dislike publicity. To enjoy giving, the frequency of it seems essential. It comes to have a relish, a real delight in it. It comes to be easy, as if giving were like the moist earth which encourages additional rain. We are glad to see this benignant feeling extend, and feel honored in being its medium. We trust to see it widen still more.

### A Telegraphic Mistake and its Consequences.

BY M. BUELL.

It was a beautiful day in the month of June, some two years ago, that Charles Fitzgerald kissed his sweet wife and bade her good bye, as the preface of a brief absence.

He had been married only a few months and during that happy time had not been called away from home; but now business of an important nature demanded his attention and he set out for Indianapolis at once.

With fond adieus and wishes for a safe journey and quick return, such as only love can call forth, and which upon this occasion shone from his wife's blue eyes like a bit of Heaven itself—the young husband started for the Hudson R. R. depot, and soon after was whirling along at a rapid rate on his journey westward.

With the usual delays of railroad travel he arrived at Indianapolis in time to meet his engagement, wrote immediately home assuring his wife of his safe arrival, and leaving a blank spot in his letter to indicate the place where he had deposited a kiss for her, was soon absorbed in his business affairs.

Two days passed quickly, and on the evening of the third he was congratulating himself on his success and how glad his young wife would be to hear of it.

After chatting a while in the office of the hotel he retired to his room, happy at his success and his heart full of love, he sung—

"Powers celestial whose protection  
Ever guards the pure and fair,  
While thus far from home I wander,  
Be my angel wife your care;  
Protect that form so fair and gentle,  
Fair and gentle as your own,  
Let her joyous kindred spirit  
Draw your choicest influence down."

Scarcely had the last words left his lips, when knocking politely at his door, the porter entered with a telegraphic message. Fearing that something might have happened at home to make it necessary to telegraph him, he could scarcely muster courage enough to break the seal. Visions of runaway horses, his wife dangerously hurt; burglars robbing the house; every possible calamity passed before him. He took a sudden resolution, never, under any circumstances, to leave home again. Tearing open the message he turned it, of course, upside down, turned it over, read it, and was a most astonished man.

His brain began to whirl. Could he have been duped? Had the being who possessed all the love man is capable of yielding up to the one whom he idolizes practiced deception upon him?

It was as follows:

NEW YORK, June, 1867.

TO CHARLES FITZGERALD, Indianapolis:

Your wife sick; had a child yesterday; doing well to-day; don't be alarmed.

Mrs. Brown, Nurse,  
9872 Fifth avenue.

His name was Fitzgerald, and, when at home, he lived at 9872 Fifth avenue.

Perfect and devoted as his love had been he was alarmed. He knew nothing of any such event likely to occur; he felt deceived and alarmed.

Silently gazing for a moment into the vacant air, as if he saw the form and face of his wife supplicating for forgiveness, Mr. Charles Fitzgerald was conscious of a small hurricane arising within him. Hastily packing his trunk, he rushed down stairs, paid his bills, and demanded to be sent to the depot at once.

The clerk had told him that no train left for some hours but he did not hear him. The hours passed tediously away and it seemed to him a week before the train started and he was homeward bound, with a heavy heart.

Between Albany and New York he fell asleep, had horrible dreams of wet nurses, baby wagons, doctor's bills, tin whistles and Godfrey's cordial, all danced in their respective turns before him.

At last he reached New York and jumping into a hack, vociferated in a very decided and tragic manner to the Jehu, "Home!"

"Can't drive you home, unless you tell me where you live," answered the unterrified whip.

"Then drive to 9872 Fifth avenue, quick!"

In a few moments he was in front of his home; mounting the front steps, the bell received a jerk which brought the servant from the kitchen without much delay.

"Susy," he said, rudely seizing her by the arm, and striking an attitude very Forrestian, "how is Mrs. Fitzgerald?"

"She is better this morning, but I guess she didn't expect you home so quick," replied Susy.

"No, I suppose not, and that is the very reason why I came," replied he.

Mounting directly to his wife's room, and knocking on the door for admittance, a strange voice squeaked out—

"Who's there?"

"It's me," he replied.

"Who's me," replied the voice with the squeak.

"Charles Fitzgerald, and I wish to come in at once," he replied, getting somewhat worked up at the idea of being kept out.

"You can't come in just now," said the squeaky voice, "I'll let you in in a minute."

Charles Fitzgerald felt very bad and very much abused just then. The telegraph was right, here was Mrs. Brown, nurse, with a vengeance.

His ear was applied to the key hole, but no infantile sounds were heard, and he was fast losing his temper, when Mrs. Brown opened the door.

Entering the room hastily he was about to rush to the bedside to embrace his little wife, when he thought of her deception, and approached with great dignity and reserve, looking upon her as man looks upon a fallen idol, and simply said—

"Madame, I hope you are better this morning; I was very much surprised to hear from you by telegraph."

"My dear Charles," replied the young wife, tears filling her deep blue eyes, "why do you treat me so coldly? Are you not glad to see me?"

"Madame," he replied, "does not your own conscience tell you that you deserve no show of affection from me? Have you not deceived me?"

"Deceived you, Charles, I deceive you, why—don't understand you, what do you mean?" she almost groaned.

"Yes, deceived me," replied Charles, "you did not tell me of this before I left home."

"Tell you what?" replied Bessie, amazed, "I did not know that I would be sick, and could not have known it. Dr. Williams says I can sit up to-morrow."

"And you did not mean to deceive me, Bessie?" replied Charles, with all his old affection returning.

"Certainly not; and now Charles do give me one kiss and tell me what all this excitement means."

"Yes, yes, Bessie, a dozen of them, here they are: and now Bessie, show me that baby!"

"The baby! Why, Charles Fitzgerald, are you crazy—the baby—what baby?"

"Come, Bessie, now don't tantalize me—show me that baby!" and as he waited a response he heard a stifled laugh, and turning around beheld Mrs. Brown, engaged in stuffing her apron down her throat, in which operation she would have finally succeeded had Mr. Fitzgerald not interfered with her design.

Bessie also caught a fit of violent laughter, and Fitzgerald stood between these two laughing women scarcely sure of his own identity. After they quieted somewhat, he ventured to remark that it might be very amusing to them but exceedingly unpleasant to him.

"Ladies," said he, "if you will be kind enough to show me that baby, I will join in your fun, too."

"Why, Charles," said Bessie, "what does all you! I've got no baby. Never dreamed of such a thing."

"Thunder and Mars," cried Fitzgerald, "you have got no baby!" Mrs. Brown, look you here, Madame. Did you not send a message by telegraph to me, saying my wife was sick and had a child, and for me not to be alarmed?"

"My good gracious," replied Mrs. Brown, "I did telegraph you that your wife was sick, and so she is, she has fever now; I said she had a child not a child."

The truth broke upon Fitzgerald's mind at once—confound that telegraph, it had made a mistake and caused all this trouble and confusion. The last "I" of the word child had been changed by the convulsive shiver of some miserable repeater, into a "d," and a child became a child. Unlike Micawber, he was not a father, nor any other man.

Throwing his arms around his darling Bessie, in sweet embrace, he asked forgiveness.

Bessie, with an arch smile, looked up lovingly into his face and roguishly said, "Charlie, wait!"

Charles Fitzgerald, in his fullness of joy, could only say, "I will. Meanwhile I'll lay my claim for damages before the telegraph company, for thus rudely disturbing my parental longings."

It is not known whether the claim was ever presented.

History informs us that mankind's representations of outward objects have been developed in like manner as with the child, which learns to cognize the indications of its senses only by degrees.

## Samuel C. Bishop.

There is no longer a Bishop Gutta Percha Company. It is dissolved, bought out, defunct. There remains to us and the public, simple, sole, Samuel C. Bishop, Esq., owner, master, proprietor of the whole concern, and L. G. Tillotson & Co., New York, with Bliss, Tillotson & Co., Chicago, agents for the sale of the goods made by him. We like the individuality of the new concern. A man with a company on his back is too often, and always seems to be, a burdened and heavy laden concern. We thank Samuel C. for getting into his own boots. We know him now and can touch him and can feel that we have a cable maker among us. Mr. Bishop you have our bones. Go ahead and get.

Acknowledgements of Insurance Remittances for Assessment No. 8 and Anderson Fund are delayed until next number.

## Telegraph Base Ball in Ohio.

CINCINNATI, July 21st, 1869.

On Saturday, the 10th instant, pursuant to an invitation from the Blue Stocking Base Ball Club of Cleves, Ohio, the Telegraph Night Owls took a trip to that place, and after a very close game of seven innings, were defeated by two runs, the score standing 19 to 21. In the afternoon, at their request, we all proceeded to Bayer's Grove, where a picnic was on the tapis, and where all had a very pleasant time. Some of our boys, after refreshing themselves with a fine swim in the Ohio River, paid a visit to the tomb of the late President Harrison, which is situated on a beautiful knoll, about a mile and a half from Cleves. The tomb is in a very dilapidated condition, part of the masonry having fallen to pieces years ago, and as yet has never been repaired—a lasting disgrace, to say the least, to the people of this State, if not to the whole nation.

Last Thursday the Blue Stockings' kindness to us was reciprocated here, when we had a tilt with them on the grounds of our famous Red Stockings. This time, after a plucky up-hill fight, we defeated them by one run. Game was to be called at the end of the seventh inning, and when the Owls came to the bat they found themselves in a tight spot, having seven runs to make to win. Kern was the first to wield the willow, and, as usual, made his base, and stole home on passed balls. Gould and King earned their bases by safe hits, when Spink, by a "corker" over second, fetched them both home, and went to third. Caulkins and Black added two more to the score, when Baker struck out. One out, and the score a tie! Williams, by a high hit to right field, made his second, stole to third, and coming home on Webb's "daisy cutter," scored the winning run. None too soon, for Kern immediately went out on a foul bound to Walsley, and Gould was fielded out at first by Cooper to H. Horton. Below is the score:

NIGHT OWLS.	O.	R.	BLUE STOCKINGS.	O.	R.
Gould, 1st b.	3	3	T. Walsley, c.	3	2
King, 3d b.	2	3	Carr, p.	1	3
Spink, c.	0	5	Hayes, r. f.	3	2
Caulkins, c. f.	4	1	Cooper, s. s.	1	4
Black, p.	2	2	A. Walsley, 3d b.	3	2
Baker, r. f.	5	0	Quinton, 2d b.	2	2
Williams, 1 f.	3	1	H. Horton, 1st b.	3	2
Webb, 2d b.	1	3	Aull, c. f.	4	1
Kern, s. s.	1	4	T. Horton, 1 f.	1	3
	21	23		21	21

## INNINGS.

Night Owls.	2	2	3	4	4	0	7—22
Blue Stockings.	2	3	7	2	3	0	4—21

Umpire—Mr. Barber, Buckeye B. B. Club.

It is proposed to get up a game between the New York Operators and the Night Owls, with what result you will be duly informed. VOYAGEUR.

## Purchase of British Telegraphs.

The telegraph purchase bill passed in committee. There was a decided majority in favor of making a permanent monopoly of the telegraph lines. The bill providing money for the purchase has passed its second reading, the amount required being, as we have before stated, about \$40,000,000.

## Telegraphers' Base Ball Match.

The Telegraphers' nine went to Brooklyn, Saturday, July 17th, to play a picked nine from the New York Stock Exchange, and instead of meeting an amateur nine found a nine composed of professionals from the Star, Independent and Oriental Clubs of Brooklyn. Not in the least dismayed, and although minus the services of their excellent catcher Taafé, they went to work with a good will and in the end showed the Brooklynite professionals what a nine of amateurs could do. The batting of the Telegraphers' nine, for amateurs, excelled anything we have seen, two and three bases being made on every hit.

The Stock Exchange nine had very good stock in the field, but they seemed to be unable to get near enough to make a fly catch. It put us in mind of the Cincinnati and Atlantic game.

General play of all very good.

We annex the score.

STOCK EXCHANGE.	O.	R.	TELEGRAPHERS.	O.	R.
Merritt.	5	2	F. H. Seibert.	4	5
Higbee.	4	4	Jones.	3	7
Knight.	2	6	Glover.	3	6

Booth 2—Total 7.

Time of game—3 h. 25m.

Scorers—Messrs. Kearns and Gascoigne.

Umpire—W. Howard, of Mohagan B. B. C.

## Telegraph Base Ball in Buffalo.

BUFFALO, July 15, 1869.

## EDITOR JOURNAL OF THE TELEGRAPH:

The second and concluding game of the match between the operators of the Western Union Telegraph office of this city, and the Scribes of the city buildings, was played this afternoon.

On the fifth innings the game stood a tie, each having scored twelve runs, but by superior batting the Telegraphers took the lead, and at the close of the eighth innings game was called and the Telegraphers were declared victorious.

The following is the score:

TELEGRAPHERS.	O.	R.	CITY.	O.	R.
Barker, c.	3	3	Crowley, 3b.	2	2
Slacer, 1b.	4	2	Pierce, c.	3	4
Soobell, ss.	3	4	Wright, ss.	1	3
Mead, 3b.	1	5	Robins, p.	1	5
Allison, 1f.	4	3	Holley, 1b.	3	3
Kellogg, 2b.	3	4	Werrick, 1f.	5	1
Sapey, rf.	2	3	Gillespie, 2b.	3	3
Felthousen, p.	2	3	Cook, rf.	4	1
Boetwick, cf.	2	4	French, cf.	2	3
	24	31		24	25

Score of first game mislaid, but the result was two to one in favor of the Telegraphers.

The Telegraphers have played but five games, in all of which they were victorious.

Yours, &c.,

## Brooks' Paraffine Insulators—More Testimony.

WESTERN UNION RAILROAD CO.'s TEL. DEPT.,  
RACINE, WIS., July 1st.

DAVID BROOKS, Philadelphia:

DEAR SIR—Having used your insulators for two years, I think I have given them a fair and impartial trial, and I would recommend any and all to use none other. I do not think their value can possibly be over-estimated as an insulator.

I notice no poles during these two years to have been struck or shattered by lightning, where these insulators are used.

Shall put on about 2,500 of the Brooks insulators next season.

Respectfully,

E. O. WAITE,

Supt. of Telegraph.

## THE STANDARD AMERICAN WORK ON THE TELEGRAPH: MODERN PRACTICE

OF THE  
ELECTRIC TELEGRAPH.  
A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

## WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUGH, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SABINE.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGER.

## WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—The Telegraph.

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—London Mechanics' Magazine.

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—Journal of the Telegraph.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS,

PUBLISHERS,

28, 30, 32 Centre Street.

## DURANT'S

## NONPAREIL RELAY.

A PRACTICAL

## SELF-ADJUSTER

ON ALL ORDINARY CIRCUITS.

Price, \$30.

Mr. GEORGE E. SEIBERT, Western Union operator, 145 Broadway, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a Self-adjuster in every respect."

For a full description of the construction and advantages of this instrument see Journal of the Telegraph of December 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office Order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,

Office and Factory, 86 Nassau Street,

NEW YORK CITY.

Agent for the sale of the Nonpareil Relay on the Pacific Coast,

Mr. STEPHEN D. FIELD,

San Francisco, Cal.

## Journal of the Telegraph.

SUPERINTENDENT Hubbard and Mr. Ed. Creighton, with their wives, are on a trip to San Francisco, to be gone about two weeks. Manager Lehmer attends to the duties of Mr. Hubbard's office during his absence.

THE line from Helena to Fort Benton, Montana, is now completed.

### Syracuse, New York.

#### OFFICE OF THE WESTERN UNION TELEGRAPH COMPANY.

For several years past the Western Union Telegraph Company has occupied a portion of the building on the corner of Washington and Salina streets as an office. Recent improvements caused the temporary removal of the Company's office, but those improvements having been completed, the office has again been returned to its former location, and at present the Company occupy rooms fitted up with especial reference to the rapid transmission of the immense business done by the Western Union Company. The rooms fitted up will compare favorably with those occupied for similar purposes in any portion of the country. The public entrance is on Salina street, immediately from the sidewalk, and stepping down four stone steps, one finds himself in the

#### RECEIVING ROOM,

where all messages are received for transmission. The receiving room is separated from the office by a wood and stained glass partition through which arches are left for receiving messages or transacting other business. Around the sides of this receiving room are arranged handsome desks and other facilities for the inditing of messages. Opening off from the receiving room is the messengers' room, for the especial accommodation of the messengers, which is connected with the office by a low railing. The operating room is provided with five large black walnut tables divided into quarters by heavy glass partitions to prevent the confusion of sound which would otherwise occur. Each table has four sets of instruments, all of the latest improved make. Each table accommodates two operators, each of whom takes care of two sets of instruments. Gas burners, situated at the intersection of the partitions furnish light for the operators. The receiving room, office and operating room occupy a space of forty-eight by twenty feet in area. At the east end of the operating room is a large wardrobe for the accommodation of the operators. The new office was fitted up under the supervision of

#### SUPERINTENDENT S. B. GIFFORD,

who occupies a room in the third story of the building. Superintendent Gifford is well known to the majority of our citizens. He commenced his career in telegraphy many years since as messenger boy, and by his integrity and close application to business, has risen step by step until he occupies the superintendency of the Seventh District, extending from Albany to Buffalo, east and west, and to Watertown and Elmira, north and south. The Company, in their selection of superintendent for the Seventh District, could not have found a more competent man than Mr. Gifford. The office in this city, since the resignation of Mr. John D. Stone, has been under the supervision of

#### MANAGER D. L. PIKE,

who, with an able corps of assistants, has given the most complete satisfaction to the public generally. Mr. Pike is assisted in his official duties by the following corps of assistants:

Chief Operator—D. V. Ferris.

Assistant Operators—J. C. Kelly, P. Kelly, H. L. Gramzow, J. H. Topliff, A. J. Schall, C. H. Parr, E. H. Crawford.

Night Operator—E. N. Taylor.

Day Clerk—C. H. Pierce.

Night Clerk—W. H. Barnes.

Office Boy—J. Cummings.

Messengers—J. Marquardt, E. Patterson, E. McCormick, J. McCanna, Thos. Tyrell.

Battery Man—D. Leary.

Repairer—E. Powell.

The entire outfit of the Company's office at this point corresponds favorably with that of most metropolitan offices, and under the superintendence of Mr. Pike, the Company may rest assured of a prompt and energetic management of their interests in Syracuse.

## SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## Western Union Telegraph Company.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIN,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

**THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

**GREAT AND UNIFORM STRENGTH,**

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS.

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET.

PHILADELPHIA.

The guarantees of this insulator are :  
1st. A current resistance in rain or fog, or in rain and fog,  
combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog  
or rain and fog combined, to its full working capacity, or the  
capacity of a similar wire or conductor placed upon any other in-  
sulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a  
No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the  
term.

It does not depreciate from exposure to smoke, soot and the  
gases from combustion to one hundredth part of the extent of or-  
dinary insulators.

It is not injured by atmospheric discharges. It is a protection  
to the poles from the same effects, there not being an authenti-  
cated instance of a pole being injured where these insulators are  
used.

JOHN POLHEMUS, Printer and Stationer, 103 Nassau Street, N. Y.

**SAMUEL C. BISHOP,**

Successor to

THE BISHOP GUTTA PERCHA COMPANY.

The Original and Only Manufacturer in the United States of every  
description of

PURE GUTTA PERCHA GOODS.

INSULATED SUBMARINE TELEGRAPH CABLES.

INSULATED TELEGRAPH AND ELECTRIC WIRE.

The Insulation of Telegraph and Electric Wire with Gutta Percha  
has been adopted by the manufacturers of these articles, in Europe  
as well as here, and in an experience of over TWENTY YEARS  
has never failed.

I also Manufacture

WATER, BEER AND SODA PIPE,

CHEMICAL VESSELS,

GUTTA PERCHA SHEET OF ALL THICKNESSES,

TISSUE SHEET FOR HAT AND CAP MAKERS' USE

COTTON AND SILK COVERED WIRE,

BRIDGE'S ELECTRIC CORDAGE,

BISHOP'S COMPOUND CORDAGE, &amp;c., &amp;c.

FACTORY, 422, 424, 426 EAST TWENTY-FIFTH STREET.

## The Sun and the Earth—Curious Influence—A Magnetic Storm.

[From the London Spectator.]

On September 1, 1859, shortly before noon, two astronomers—Messrs. Hodgson and Carrington—one at Oxford, the other in London, were at the same instant scrutinizing a large group of sun spots. On a sudden, two intensely bright patches of light appeared in front of the cluster. So brilliant were they that the observers thought the darkening screens attached to their telescopes must have become fractured. But this was found not to be the case. The bright spots indicated some process going on upon the sun's surface—a process of such activity that within five minutes the spots traveled over a space of nearly thirty-four thousand miles. Now, at the Kew Observatory there are self registering magnetic instruments which indicate the processes of change by which the subtle influences of terrestrial magnetism wax and wane. At one time the line traced by the pointer will be marked by scarcely perceptible undulations, indicating the utmost quiescent state of the great terrestrial magnet. At another, well marked waves along the line exhibit the pulsations of the magnetic system, influenced in a manner as yet unintelligible to the observer. And then there is a third form of disturbance—the sharp, sudden jerks of the pointer exhibiting the occurrence of those mysterious phenomena termed “magnetic storms.” When the records of the Kew observatory came to be looked over, it was found that at the very instant in which the brilliant spots of light had appeared to Messrs. Hodgson and Carrington, the self registering instruments had been subjected to the third and most significant form of disturbance—a magnetic storm broke out on the sun's surface. But this was not the only evidence of the sympathy with which the earth responded to the solar action. It was subsequently found that soon after the spots of light had appeared the whole frame of earth had thrilled under a mysterious magnetic influence. At the West Indies, in South America, in Australia, wherever magnetic observations are systematically made, the observers had the same story to tell. In the telegraphic stations at Washington and Philadelphia, the signalmen received strong electric shocks. In Norway, telegraphic machinery was set on fire. The pen of Bain's telegraph was followed by a flame. And wherever telegraphic wires were in action, well marked indications of disturbance presented themselves. Even this, however, was not all. The great magnetic storm was not a mere instantaneous electric throes. Hours passed before the disturbed earth resumed its ordinary state. And thus it happened that in nearly all parts of the earth night fell while the storm was yet in progress. During the night magnificent auroras spread their wavering streamers over the sky, both in the northern and southern hemisphere. As the disturbed needle vibrated, the colored streamers waved responsive, and it was only when the magnetic storm was subsiding that the auroral lights faded from the heavens. Now it is evident that these

phenomena show the most intimate relation between these peculiar disturbances in the sun and the magnetic currents of our own earth. Directly one of these changes takes place, upward of 90,000,000 of miles away, the electrical condition of our planet is changed in some mysterious way, of which our instruments, and even the condition of our sky, bear record. The pens of all our telegraphic wires may some day trace in flame a handwriting more ominous of human destiny than was the handwriting which during Belshazzar's feast traced a warning on the wall of the fall of the Babylonian dynasty. Moreover, note this, that these changes in the condition of the sun take place at intervals of about eleven years. The variable star which swings around it, as well as supplying us with light and heat, and (apparently) magnetism, clouds over eleven years these spots, so that it seems most likely that every eleven years certain magnetic conditions recur which have not occurred in the interval. If so, perhaps the magnetic excitement of 1859 will recur, and it may be in much greater force next year, in 1870; and if it does, how are we to say what may or may not occur with it? Even now one such epoch of magnetic storm seems to be thought pretty near at hand. The sun has been exhibiting the most surprising forms of disturbance, and presenting to scientific eyes less “fixity” of essence than ever. Spots so vast that we must estimate their dimensions by millions of square miles have broken out from time to time, and have presented rapid changes of figure, indicating the action of forces of inconceivable intensity. Clusters of similar spots extending over yet vaster areas have exhibited every form of disturbance known to the solar observer, and every degree of light, from the apparent blackness (in reality only relative) of the nuclei, to the intense brilliancy of the faculous ridges. And we now know that these appearances are not merely matters for the curious, with which, as they happen at a distance of above 90,000,000 of miles, practical men need not concern themselves.

### Too Much Electricity.

Every man his own telegraph operator is becoming the rule in Chicago. The wire is about to be introduced—indeed it has already been introduced—into private houses in the West, in connection with a little box which contains a lettered dial with a steel pointer revolving and stopping at the letters of the message. It is much used for calling in the services of the physician.

This application of the telegraph is convenient, but it is liable to abuse. For impromptu invitations to dinner, arranging a drive to the park, summoning the doctor, as just mentioned, asking the washerwoman about the clothes, &c., it would be all very well; but what scandal will not be talked by electricity: and what are you to do with the bore whose interminable twaddle will amount to assault and battery? These matters make us pause.—*Ec.*

There are few if any chemical actions which can not be made to produce electricity.

## THE DRUNKEN OPERATOR Olimmerley Gap.

[From the Galaxy.]

I.

Henry Clay Glenning, telegraph operator at Lindenderry railway station, sat at his desk as the dusk closed in of a gloomy April evening, a dozen or more years back. A tall, light-built young man of maybe seven-and-twenty, with a full, close-cropped brown beard, and a clever, good-looking face; but, about the eyes and mouth there were troubled lines that seemed to indicate some present, wearing care. The cold northeasterly rain beat drearily on the panes; the sashes rattled dismally in the eddying wind. There was nothing going through the line this hour or more, and Glenning leaned back in his chair in thought that his attitude showed was not at all pleasant company. He got up after a while and took down his hat and coat from the wall. It was nearly seven by the office clock. The station-master relieved him three-quarters of an hour; there was no train due until the Lake Mail, nine minutes of eight. He went out, and up the bleak, wet streets. Getting home, he left his wet coat in the passage, and passed on up the stairs. He leaned back on the landing a minute, with eyes looking down, and face compressed in distasteful revery. Then he stepped forward quickly, and went in. The table was set for two. Beside it a lady sat stitching upon some needlework in her lap. Her cheek flushed as he came in; but she did not look up. He came and sat down opposite. The angry flush remained; her lips were firmly shut; she worked on, loop over loop, and did not raise her eyes or turn her head.

“Mary,” he said, his tone was low and gentle, “Mary, I want to tell you a story.”

She glanced up askance at his face, as though surprised. But her eyes went instantly back to her lap, and her fingers worked on, loop over loop. Glenning went on; his voice a little graver, but gentle and low as before.

“On the North Rock Road, just below the South-down Mills, there is a little country store, kept by one John O'Neil and his wife, Jane. I have known the pair by sight a long time now—honest, simple, hard working folks, and prosperous, too, as things go. They have no boys and only one girl—Jenny, after her mother. I remember her a little, toddling thing, in a pink frock and gingham apron, as I used to see her playing about the place when I went out and in from the farm. She was a bright, merry child, and a great pet at home, as you may suppose. John was never tired of talking about her as a child, and praising her cleverness and winning ways. He vowed he'd make a scholar of her if he worked his nails off to do it. Well, the girl grew and grew, and last summer finished the course of the common school, and in the fall went off to Fort Hill Institute, in Tidewater. The old couple missed Jenny sadly, of course, and found the house lonely enough when the girl was gone. Their only consolation was their weekly letter, which came in regularly every Wednesday afternoon by the

Through Mail. They used to come in together in their old buggy, every week, on Wednesday, in almost any weather, and get the letter. It got to be a standing saying among the men about the station, 'There's John and Jane wants a letter from Jenny.' When I went down to the office to-day I saw them coming over from the post-office. They came in. Both looked anxious and troubled."

"Mr. Glanning," says John, "we haven't no word from our girl to-day. It's the first time it's missed, and we feel a little doubtful like. We want you to send word by the telegraph, and ask how it is."

"I sent the message to Jenny, at Fort Hill:

"No letter to-day. Anything wrong?"

"In half an hour the answer came back:

"Nothing wrong. Well and happy,

JENNY O'NEIL."

"The old pair were in great glee over their 'letter by telegraph.' They went off as happy as birds. That was about two o'clock. At three-fifteen this came." He took out some telegraph slips from his pocket, selected one and pushed it across the table. She turned her head and read:

"Jenny O'Neil died here by an accident this afternoon. Will you break the news?"

It was addressed to a clergyman of Lindendbury, and signed by the principal of the Tidewater School.

Glanning watched her as she read. He had thought the sad story would soften her. She had a woman's heart, I think; it did soften her. She too remembered the bright, fair-faced young girl on the North Rock road. But she seemed to strive against the feeling; summoned her pride to steel her against letting him see. Her face flushed up with a thrill of pity and sympathy; she could not see the work in her lap plainly for a dimness in her eyes. But she bit her lip, and kept back the tears that almost brimmed over, and forced her fingers to work on, loop upon loop.

"Mary," he said—his voice was sad and low, "I was wrong to say what I did. I was hot and ill tempered then, and hardly knew what I did. I'm sorry, Mary. Won't you let it go?"

He leaned his head on his hand, looked into her face, and waited for her to speak. She did not raise her eyes. He went on, with a very mournful tone. There was a wounded look in his eyes; she knew it, though she did not turn her own, or lift them from her lap. Very gravely he talked on to her, pleaded with her earnestly and sadly. There was no reproach in his words, no note of blame, though there was room.

She kept her mask on well; he thought she was unmoved. But I think the white teeth closed upon the lip inside, and the woman's heart throbbed hotly underneath. Suddenly she started visibly; he must have seen it. But it was not for anything he had said. She felt in her pocket, turned over the work box by her side; got up and looked about the room, pulled out a drawer or two, lifted a book or paper. She did not seem to find anything; but came back and sat down as before.

"Henry," she said, "when you're ready, we'll have our tea."

Her voice was low and calm—plainly forced; she did not lift her head. He started up at that as if she had struck him. A look of sharp pain leaped into his face. He got up quickly, and walked about the room, his head bent and his hands behind him, in a pitiful, aimless way. After a little, he stopped suddenly, facing the window.

"Mary," he said, "come here." His voice was stern.

She got up and stood beside him. The curtains hung apart. He swept them wide with his hand, and pointed through the glass.

"Look," he said.

Across the street she saw a lighted window, with

the curtains drawn aside. Inside a thick set and common looking man was playing about the room, with a curly haired child; a woman by the table looking on with a happy smile. As they looked a peal of ringing, childish laughter came dimly to their ears. He let the curtain fall, leaned back against the wall, and looked her in the face. Her eyes flashed bright, an angrier flush swept up, and dyed her cheek deep red. He words were bitter when she spoke.

"Well," she said, "what of that? Why didn't you marry Sue Stuart yourself? The fool would have had you for asking." She laughed a bitter, mocking laugh.

"I wish to God—" he began. But he stopped. She went back and sat by the table. He came and sat down opposite. He sat silent awhile, his head sunk in his hands. The attitude was one profoundly mournful—the air of a traveler lost in some unexplored forest, who sits down disheartened at last, finding no path, seeing no way to the light. A straggling lock of his hair fell down upon his face. He lifted his hand and drew out, one, two, three gray hairs. "Look, Mary," he said, "I'll be twenty-seven in June."

That arrow touched her visibly; his hair and face were not like that when they two married, nineteen months ago. He went on, with a mournful voice: "I was alone in the world. I was lonely, and wanted help. I told you that two years ago; you must remember, Mary, I said I'd be true to you through good or evil. God helping me, I'll keep my word. I said I'd try to make you happy; I meant to be happy myself. I meant to do right by you. In the main, I think I have; at least, I've honestly tried. I've said hard words at times, when I hardly knew what I said; for them I am honestly sorry, as for all my failings in love and duty. We ought to be happy together; we are neither of us that; I hardly know why. I hardly know how we came to this miserable pass. I see no way out of it now, for you or me. God help and forgive us both!"

She lifted her eyes from her lap at last, and turned upon him, flashing scorn. "Henry Glanning," she said, fronting him full with a hot, flushed face, "what do you want? What would you have? Am I happy? Have I no heart? no pulse? no nerves that can be cut and strung? Because I am too proud to show my pain; because I will not mope or whine; because I laugh to hide the bitter ache and void; bite my lips till they bleed, and crush back the sob that chokes, and the tears that blind me, do you think I am ice or stone? Must you turn on me, too? Had I not enough? You know why I married you. Was it my own free choice? I was a fool; I know it, but I say it was not; I say it was not. You say no one forced me—how do you know? No one said, you shall or you shall not; we are past that day. I wish to God they had; I would have laughed, and had my way. But is that all? Do you know how a petty household tyranny can wear and warp? A father's preference, a brother's sneers and scoffs, a sister's anger, a mother's averted face? I was a coward; I know it. If I had it to live over, I'd walk through fire, first. You were clever and handsome; they all liked you. You know what I mean. You knew it then, and should have set me right. For you I broke my faith; I was afraid of the world's silly laugh—poor, blind fool that I was! I broke my faith, I say; that was your sin and mine. Your sin, I say; for you knew, and should have died first. Do you pity me? Do you grieve for your part in making my life a shame and a lie? Pity? You blame my neglect, taunt me for my coldness of heart. Heart? I tell you I have no heart. You hear men's lies to my blame. You distrust your own wife's word. You are passionate with me; harsh, hard, cruel. You spoke to me to-day as no man has a right. I will not hear it again. I will not bear it. I warn you to beware. You may make their lies come true."

"God forgive you!" he said. That was all. He got up and went out. His head was bent, his face was haggard, but neither angry nor stern.

## II.

Slowly and sadly he went down the stairs. He wondered how it would end. He could not quite understand her persistent anger, her fierce rejection of his overtures. He had been wrong; he owned it freely. His temper was hot at times; but she could not but know that she had tried him beyond patience. No, he could not understand, or see his way. Drawing on his coat, his face was turned toward the stair. The gaslight shone upon a folded paper lying on the second step, soiled and torn. He stooped and picked it up. He glanced inside; it was written in capital letters, apparently unmeaning. A horrible suspicion flashed upon him—might not what he had overheard be true? He opened the door and went out. He stopped at the corner, under the lamp, opened the paper, and held it to the light. It was a sheet of common note paper, folded in three. A wet boot-heel had apparently trodden upon one side as it lay in the fold, and ground off a part of the writing just below the first four words. A pulpy shred connected the parts, and showed what space was gone. This was what remained:

(1) O & RQQT FGCT OCT &—

—DQP I

TT—HTU ATSUG. (3) FI SR BSYV

KYEVH. (4) NET YB EREH TEG.

AJDXN XARENE

The rain dripped down upon the paper; he sheltered it with his hat, and stood, with head bare, in the beating rain. He felt in his heart that that fourth word could be but one. He found the key in a minute's time; a simple schoolboy trick. He felt that word must be *Mary*. He tried it through the sentence, counting two letters back: o-m-c-a-t-r-&y. "*My poor, dear Mary.*"

The rain dripped from his hair; he shivered—was it with cold? He felt sick and faint; he thought he should fall. He saw the lights of the Merriman House over the way. He staggered across, through mud and water half-knee deep, heeding neither gutter nor pool, went in and up to the bar.

"Brandy," he said. He lifted the bottle; but his hand shook too much. "Pour it." His voice sounded hoarse and strange. The barman took up the bottle and half filled the glass. Glanning steadied himself by the bar. He spilled a little as he lifted the glass. He set it down empty. "More," he said. He drank it off, and went out. The church clock was striking eight. He ran on down to the station; he was half an hour late. He sat down at his desk. There was nothing going through the wires from L; only now and then some message about the trains on the railway line. The cipher changed after that first line. The burning spirit set him all ablaze; his brain was on fire, his heart a leaden weight. He studied those next legible words with a mad anxiety. They were plainly the end of a sentence, the rest of which was gone. He tried the words this way and that—counted forward, backward, one letter, two letters, three, four, five. He felt sure it was some simple trick of spelling; but he could make no sense of them for a long time. Some one came stamping in now and then out of the rain; but he paid no heed, worked at that terrible puzzle that seemed so like child's play, and was, in fact, such deadly, earnest work.

"It may well be doubted," says Poe, "whether human ingenuity can construct an enigma of this kind which human ingenuity, if properly applied, may not also resolve." In a certain sense, this is, no doubt, true. In the hiding of thought, as of treasure, it is always possible that a second mind may invent or happen upon the same method and place of conceal-

ment, and so discover the buried store. But I think I may safely engage to conceal a thought under a riddle of this sort which shall be as long in the finding as the buried gold and jewels of the pirate-captain Kidd. Here is this simple cipher, which so cruelly perplexed poor Genning that April evening. The head that constructed it was none of the cleverest, and, by consequence, the riddle was of the rudest and simplest. In these next four words the writer had hit, by good chance, upon an expedient so simple that you may easily get at the hidden meaning if you have quick mother-wit and good luck. Yet I challenge any reader to go to work systematically, and unravel the enigma by any more logical process than that of happy guessing. Take the words before reading further :

DQPI TT—HTT ATSUG.

Glennig wearied and fretted himself, to no purpose, with trial on trial. Then he tried the system commonly used with these riddles, depending upon the known excess in the number of letters, e, a, o, i, d, and so on, in their order. It would not work. He was out again. The trouble with that system, and similar ones, is that they provide only for cases in which each character of the cipher refers uniformly to one certain thing in the underlying expression; and even here the system may be easily stultified by the omission of the articles, and the use of a little care in the selection of the words employed.

In this particular instance, the writer had happened upon a pretty good plan, but showed himself plainly indebted to good luck rather than cleverness, by a blunder which a little skill would have made him easily avoid. There was a flaw in the construction which gave you a clue to the possible plan. Glennig had worked over the phrase till he was in despair of solving the terrible riddle. He leaned back in his chair and closed his tired eyes, with a baffled, beaten look. Those cabalistic words stood out before his sight, burned upon his brain in letters of fire. I do not think he would ever have construed them but for the blunder of which I speak. It struck him suddenly now; he started forward and looked. The second word of the four was "TT." By the common assumption, upon which he had worked all along, these two T's must refer to the same certain character. "TT" might, indeed, not be a word at all; it might be a number or a contraction. But the presumption was that it represented a word of two letters. Then, if the common assumption applied, this underlying word must be the double of some single letter. That was absurd on its face; no such combination, from double a to double z, forms any English word. Glennig caught at the suggestion with an eager flash; he cursed his own blindness, for not seeing it before. He saw that these two T's could not stand for the same thing—in other words, that the cipher must have been formed upon a variable plan: that a character might have different meanings, dependent upon its place in the sentence, or other pre-arranged relation. He saw how this might be easily done in a hundred ways. He tried the simplest possible—counting from the first letter one forward; from the second, two; from the third, three—and so on.

D-E, Q-S, P-S, I-M—Easm.

No; out again, d—but stop. Is that the simplest possible method? Hardly. The writer would naturally count forward; we must count back.

D-C, Q-O, P-M, I-E—Come.

Ha! He counted out the letters with a fierce haste.

—Come on—all right.

It was maddening. What could it mean? It frightened him to think; some devil's work, he felt sure. He tried the next words. The cipher had changed again; he saw what those numbers meant now—saw it,

and cursed them. "(1)-(3)-(4)." The (2) was doubtless gone with the part shredded off. These numbers meant four different ciphers pre-arranged.

Just then Station-master Farley came in and spoke to him something about a sick friend, and a request that Glennig would attend to any business that should come in for him, till he got back. Glennig tipped back in his chair, with his head thrown back, and his eyes staring up in the other's face. But while his eyes stared wide, his mind was all the while working away at the clumsy puzzle that yet had power to torment him intolerably. He nodded his head when Farley had done; but, when he had gone out, what semblance of an idea Glennig had of the whole was some dim notion that Farley wanted him to answer messages that might come in about the trains. Farley had told him something of a train off time; but of that he remembered nothing.

He worked on at the next four words. His whole being seemed to center upon that one torn, crumpled, mud stained shred with its terrible hieroglyphics. He saw, knew, thought, felt, heard no other thing. After a while the familiar sound of a message struck upon his ear, and partly roused him. He took off the message mechanically :

"Where is the Lime Lake Mail?"

He read it over and over. The words conveyed no meaning to his brain. What he did about it he knew not. The same message might have come many times, for all he knew then. What answer went back, or whether any, he knew no more.

He tried the words of the cipher back and forth, this way and that, over and over again. But he got the key at last—a stupid one enough—straight forward, counting four letters ahead.

"ALL RIGHT—COME ON. BE ON YOUR GUARD."

What could it all mean? He worked away at the rest, as one might work a problem in a nightmare dream. All else seemed dim and strange, and far away; men's voices, now and then; doors opening and closing again; once the bustle of a freight train going through. He heard these sounds in a strange jumble, without definite idea of their cause or meaning, and yet without surprise, like one in a real dream. There was little or no work for the wires. What there was he did without thought or understanding, with the machine like motions of long acquired habit.

He missed the key of the cipher this time from its very nearness and simplicity. The thought could hardly be said to be hidden. He counted forward, two letters, three, four, five, six, one; backward the same. He twisted the words and the letters; vexed himself fiercely to no purpose; all the while devouring with eagerness to know the meaning of this terrible riddle that fate had set him to solve. He cursed himself for his stupidity, when at last he saw; the sentence was simply spelt backward; letters and words reversed.

"GET HERE BY TEN."

Just then a telegram clicked off the wires. He sat a moment like one dazed; then the instinct of long habit moved him again, and he worked the instrument with his hand, God knows, not with his heart or brain.

He looked up at the clock on the shelf; it wanted five minutes of ten. He staggered out to the door, and let the cold rain drive upon his head.

### III.

My name is William Thurlow Whipple. I have been a conductor on the Tidewater and Lime Lake Railway since the summer of '51. On the 21st of April last, I ran the Lindenbury Night Express out of Tidewater at seven o'clock. We had the "George Grant" engine, James Morris, driver, and nine cars in all. The distance from Tidewater to Lindenbury is sixty-three miles; we were due at L. at 10:07.

At Wendall, fifteen miles out, we passed the East Branch Accommodation, bound in, on the switch. As we ran in, I saw Henry Brown, conductor of the Branch train, cross over and stand by our track. He did not see me yet when I hailed him :

"Helloa there, Brown! What is the word?"

"That you, Whipple?" he called. "Telegram for you from Clark's."

There was no office at Wendall; Clarksville is the next up station. It was quite dark by this time; I read the message by the station lamps :

LINDENBURY, 7:05, P. M.

To W. T. WHIPPLE, NIGHT EX., CLARKSVILLE.

Lake Mail off track between Fetterley and Glenbrook. Can't get on before 8. Come to Ashley—then look out.

MICHAEL FARLEY, S. M.

Farley was station master at L. Ashley was three stations ahead. We were due there at 8:02. I looked at my watch as we ran in. I recollect we were a minute ahead of time. I jumped down as we slowed, and ran ahead into the telegraph office. A message from Linden was waiting :

"Lake Mail off yet, west of the Junction. Come on till 9."

We ran on west, making good time. Glenbrook is twenty-two miles west of Lindenbury; we should have passed the Lake Night Mail at Winterville, next west of Clark's. I felt a little anxious about it as we thundered on through the darkness; there was no moon that night, and west of Wamona the sky was overcast and the air full of misty rain.

It was five minutes past nine as we ran into Clairwell Station. I telegraphed to L. for orders. They came :

"All right. Come on."

The rails were slippery with the thick mist; we had lost time on a heavy up grade, three miles back. I waited for no explanations, ran out and started the train. At Wrexell, the East Branch Freight was due; the branch joins the main line at Glenbrook. I went forward and watched for her lights when the whistle blew at Blackman's Crossroads. There was the bright head light of the great "Sampson" freight engine, a mile away, waiting for us on the turnout. I stood on the engine steps as we ran in. As we came up with the "Sampson," and ran slowly past, I hailed the engineer :

"Hallowell! Helloa! Hear anything of the Lake Mail?"

"Passed Clannerlane at Glenbrook. Had men to work on his feed pipes. Said he'd be right in half an hour."

Half an hour? He must be at Cunningham by this time—or Whewell's Bend at farthest.

I telegraphed to Lindenbury :

"Where is the Lime Lake Mail?"

Directly the answer came :

"Come on. All right."

The same words over again. Not a word of that train ahead. It was strange; but we were behind time yet.

"Go ahead!" I called. "Make up lost time."

It was twenty-seven minutes past nine. We had nineteen miles yet to Linden. It was five miles to Brentford, the next station west.

At Brentford I telegraphed again :

"Where is the Lime Lake Mail?"

I knew the Brentford operator, of course; his name was John Murray. He sent off the message, repeating the words aloud :

"Where is the Lime Lake Mail?"

Waiting the reply, I asked him :

"Have you had any word of the Mail this side of the Branch?"

"Not a word. No messages west of here, except to you, since half after seven."

The return message clicked off the wires. You may be sure I watched Murray's lips for the words. Again the very same ;

"Come on. All right."

Not a word more.

I had no time to wait. We were still a little behind. My duty was to make that up and obey my orders.

"Give me the slip," I said.

I had the other two in my pocket. I remembered that, and was thankful for so much. They would clear me, whatever happened. But, none the less, I was fretted by the thought of that off time train somehow ahead in the dark. I signalled Morris to increase the speed. I stood by a lamp and took out the three slips of telegraph paper. There was no mistake. I read each one over carefully. The words were plain: "All right. Come on."

You say I had no cause for such anxiety as I describe? that I was pretty close on time; the words of the telegrams simple, and such as would naturally occur in such a case; that the same words should be repeated was no more strange than happens every day. You think I exaggerate for effect? I say you know nothing about it. I say it was strange that those words were three times repeated. It was strange that they should come at all in answer to my message; they did not answer my question. Hallowell said Clannerlane expected to be after him in half an hour. By that we should have met him at Brentford Station. I say I was horrible anxious; ten times more than I've written down. One says, I was mad to increase the speed, fearing what I did. I tell you I did my duty. I was bound to keep on time and obey my orders. They have no right to taunt me; it was bad enough without that. I say I did my duty. It was only three miles and a half to Hackerby. I was thankful to hear the whistle at the last cross roads. I was in the office before the train had stopped.

"Marks," I cried, "do you know where's the down mail?"

"No."

"Telegraph Linden; quick! Say, 'For God's sake, where is the Lake Mail?'"

I thought the answer would never come. I longed and feared to hear it. Here is the slip now, with those same terrible words:

"All right. Come on."

As Marks read those words, I broke out with a curse.

"What's the row?" he said. "Hold on. There's more."

I jumped at that.

"Go on. Quick!"

"All right. Come on. Be on your guard!"

I rushed out. Morris was watching. I waved my arm. The train moved on. It was scant four miles to Garrowfield, the last this side of Lindenbury. I went forward and looked out ahead. We were running pretty fast; thirty-five miles to the hour, I should say. We were up to our time at last. We were running through the Clitheroe Hills, the road winding up the valley of the Garrow; to the left the river flowed dark and silent. Now and then you caught a gleam from the gloomy current; here and there, the sound of its brawling over a stony bed. You saw the lights of a village, now and again, twinkling among the looming hills across the Garrow. Here we crossed a roaring culvert; then, the river running to the right, ran out on the high embankment at Mack's Ford, and so across by Half Mile Trestle Bridge.

I kept my eyes ahead; a horrible fear tormented me. That strange, four times repeated telegram tortured me. The words were constantly in my ears. I heard them in the roar of the rushing train—"Come on, come on, come on!" And those other added words; what could they mean? Why were we to be on our guard? Where could that Lake Train be? Why had

they not sent me word? It was a terrible muddle altogether. In nine years' running on railway trains I had never known anything like it. All the messages had come from Linden. The Lindenbury telegrapher I had known for years. His name was Harry Glenning, a tall, brown bearded man of twenty-nine or thirty. I say I had known him long; I do not mean that I was intimate with him, but that I knew him as one knows the men he meets every day. He was a superior man every way, as we railway men go. We all owned to that in a tacit way, and most of us liked and respected him much. He was the last man on the line that any of us would mistrust. Temperate, punctual, somewhat taciturn, he was always at his post and never made mistakes. Of late, he had grown more quiet than ever; it was evident that some secret trouble was wearing on him. His face had got a careworn look; we noticed a streak of gray here and there in his hair and beard. But, if anything, he was more faithful than ever in his work in the Linden office. Of course, we never spoke to him about the change in him; but we did among ourselves, and we were all sorry for him, in our way.

Farley said it was his wife was leading him a sorry life of it. He had married, a year or two before, a girl from Caromel Corners, they said, named Mary Winton. I think. Only the day before, coming down with the Garrow and Glen Kilns Express, I had met Blissom, with the up mail, at Hackerby Station, and said to him:

"What's up with Glenning, now? He looks dreadfully cut up."

Blissom was a Lindenbury man; I live at Tidewater, myself.

"That Mary Winton's a-leading Glenning a naggy tramp of it, I hear," says Blissom; he knew Mary before she was married. "They do say she's a tarrier to go on when her back's up, and gives it to Glenning all-fired." Blissom was a good fellow, but rough.

But, as I said, Glenning seemed all the more faithful since his home troubles; I never thought of doubting him. So we plunged on through the darkness. We had a passenger car that night, as it uncommonly happened, directly behind the tender. I stood on the forward platform, and kept an anxious lookout. The air was full of a thick drizzle: our speed made a strong west wind there, outside. On we went, keeping our pace well up—we had no right to go ahead of time—through Sadler's Drop, in the Clitheroe Hills, out then into the level country beyond. As the whistle blew for Garrowfield Station, I passed back through the forward car. The telegraph office in Garrowfield is a little east of the platform. Seeing the passengers look hard at me, I then first noticed that my clothes were dripping wet. Near the rear end of the car, an Irish woman sat, with her head on the window, fast asleep. I shook her roughly; I hoped she might get down here. She started up with a confused flutter.

"This Hackerby, sir?"

"Last station back," I said. "You're too far on."

"Ow, thin, an' what'll I live I do?" says she. "Shure, Dennis is afther expictin' of me, an' he'll think I'm kilt intirely."

"You must get off here," I said. "Come, be quick." The train was beginning to slow speed.

"Shure, thin, sir," she pleaded, "It's meself has an own sister, in a laundry in Lindinbarry, itself. If ye'd be so kind to lit me down there. I haven't no money, sir; but I'd bring it to you bright in the mornin'."

"Can't do it," I said. We were close upon the station. I hustled her out, roughly enough, I suppose.

A gentleman, sitting by with his wife, had been watching us. I saw his face fire up as I hustled the woman out. He jumped up and faced me.

"What do you mean?" he says, all hot. It's a

brutal shame to put the woman off in the night in a strange town, with no money. Here, I'll pay her fare!

I pushed her through the door; gave him no answer. He held me by the arm.

"Your name?" he demanded, sternly. "Mine, Charles Holden. I'll report you."

I was not angry with him—he did not know.

"My name is William Whipple."

I saw a fellow I knew on the platform.

"Calet," I calls; "show this woman a decent lodg'ing. Pay—I'll make it all right."

I telegraphed to Linden:

"Shall I come on? Why don't you send me word of the Lime Lake Mail?"

I don't think I breathed till the answer came:

"Come on. Be on your guard. GET HERE BY TEN."

Good Heaven!—it was maddening. What did it mean? what could it mean?

I rushed out, waved my arm madly to Morris.

"Go on, there—quick!" I yelled.

I ran ahead, and climbed up the engine. I looked at my watch. It wanted six minutes of ten! I held the slip before his eyes. His face blanched white as a corpse.

"Good God, Whipple! it's seventy miles an hour!"

"I don't know it means. It's some mad work. But we've got to obey orders. Drive like h—!"

I ran through the train taking the fares. How could they laugh and talk?

Every minute I heard the scream of the train ahead that I dreaded as I shall never fear death. The speed increased steadily. The cars rocked on the springs. The passengers grew uneasy; the women looked fearfully one to another. Some men expostulated:

"Why are you running so fast? Do you want to murder us all?"

"We are ordered to be at Lindenbury by ten," I said. It wanted just four minutes. I saw the glare of Bell's Rolling Mills flash by—five miles and a half to L.!

I ran forward to the platform of the first car. By the forward door sat a lady, with a child in her lap, asleep—a little fair haired girl of three or four. I see it as plainly now as I saw it then. I hardly know why, but little things that occurred that night seemed burnt into my memory in colors of fire. I lie back now, here on this bed, where I have met, at strangers' hands, more true kindness and Christian courtesy than I had believed in before; and, shutting my eyes, I see that sweet child's face smiling in its pure dreams, the mother's beautiful face brooding above it with a look of heavenly tenderness and love. I feel the heave of the hurling train, feel the car away and spring with the terrible speed. I remember all, as I saw it hurrying through the car. I passed out on the platform. It wanted three minutes of ten. I knew we could not make it, though Morris was driving on with every pound of steam. I saw him standing at the lever, brawny and stalwart against the glare of the head light, flying ahead on the track, one arm raised and grasping the lever, looking steadily forward, never turning his head to the right or left. I knew what he looked for—only too well! I shudder and turn sick to think of it now.

Before Heaven, it was awful. To stand out there in that rushing whirlwind, clinging as for your life in that swaying hurling flight; to stare forward into that awful darkness; to strain your sight until you were dizzy and blind, and your eyes were fire; and yet not dare to close them or turn away—deafened and stunned by that terrible jar and roar; heart and pulses faint with a horrible fear—the fear of sudden death!

Was I a coward? who says it? May he be tried alive! God forgive me—what do I say? Pray Heaven, no—that were a fiend's prayer. I do not say I did not care for myself. I did—who cares not for his life that is man? I thought of a little humble home sixty miles

behind; of a little brown faced boy, smiling in happy sleep; of a dear heart bending over the crib, perhaps; sewing by the lonely lamp; praying for me, it might be, out of her pure, true heart. I thought of these, and I prayed to Heaven to spare me to life and love. But more than of this, I say and I know, I thought of the hundreds that trusted to me for their lives—looked to me to see to it that they encountered no needless peril. To strain ahead into that awful gloom—to think and think of those poor souls in my charge—I swear it was torment.

I lost all sense of time and place, in the intense strain of sight and thought. I could not say where we were; it seemed we were running for hours. I knew what I looked to see—what I feared with a horrible dread; I knew only that.

Morris never slackened the pace; he drove his engine on with every pound of power. They tell me we made five miles in half a minute more.

Suddenly we leaped through a belt of deeper gloom; a heavy roll of thunder struck my ears with a stunning crash. I knew it was Merrill's Gap. The road lay level through the plain ahead to Climmerley Gap beyond. Half of the way was passed; we hurled on; terrible as fate.

Suddenly, out of the blackness of Climmerley Gap, there flashed—oh God!—a great, white light!

I went in then and shut the door.

They must have seen it in my face. When I turned and looked forward again, the lady with the child stood at my side. I shall never forget the look in her face; the child was clasped to her heart. "What is it?" she said.

She spoke in a whisper, more awful than any cry. The two engines screamed like charging demons; wheels reversed, and every brake hard down, we went staggering, shuddering, grinding on to our doom. But, through all that terrible din, I heard that awful whisper from those beautiful, bloodless lips.

I pointed forward to the great, white light, glowing down the line straight upon us.

"It's death," I said.

She answered me not a word. She lifted the child to her face, then clutched it to her heart, "Louise, Louise!" she moaned, and sank back out of my sight.

I stood and looked ahead. At the first alarm, the fireman had jumped. Morris stood to his post. I saw him whistle down brakes, reverse his engine, set his bell ringing, do all that mortal could do. Then he stepped back, steadied himself, and leaped out into the dark. I saw it all; it was only a moment's time.

That terrible white light dashed straight upon us—that awful, blinding glare of death!

I heard a horrid crash, like ten thousand cannon—like the rending of a world. I felt myself lifted and hurled through the air—knocked, battered, pounded, pressed, bruised, twisted, crushed, struck on the back, as with a steam-whirled shaft. Then I was lying on the grass with a blinding glare in my eyes. I heard a low, weak moan. I turned my head—a woman lay close beside me with a child clasped tight to her heart. There was blood on the beautiful lips—both were dead.

I remember no more. Heaven spared me the rest of that horrible night. I was taken up for dead. They brought me here, to St. Stephen's, to this bed, where I have lain these six long months—long months and very weary, though all that gentleness and skillful hands could do has been done for me.

I have the papers with the account of the disasters. There is a sickening list of killed and maimed—so long that I shudder when I look. Among the dead, I read: John Blissom, driver, off duty. Ellen M. Villers and child, Louise, of Glenbrook. Charles K. Holden,

President of the Clitheroe Bank. He knows me better now—where honor, and a brave, kind heart have found their just reward.

W. T. WHIPPLE.

ST. STEPHEN'S HOSPITAL, 19th October.

(From the Tidewater Herald, 23d April.)

The wretched operator, Henry C. Glenning, of Lindendbury, whose drunken folly caused the terrible disaster on the T. & L. R. R., night before last, hung himself yesterday morning, in a barn near Climmerley Gap. The evidence at the coroner's inquest went to show that deceased had partaken freely of brandy on the evening of the collision, after he was already in a state of evident intoxication.

In another column of this morning's "Herald," we print the only full and reliable lists of the killed and injured. Among the latter, our readers will notice the name of Mrs. Mary W. Glenning, wife of the Lindendbury operator, who received "severe contusions of the head and face," and now lies at a farm house in a critical condition. Thus it strangely happens that the perpetrator of this terrible crime has his own wife for one of his victims. We learn that she intended to have taken the regular Down Night Express; but, being early at the station, caught, most unhappily, the belated Mail. Upon her person was found a through ticket from Hilary, next west of L., to this city. She was escorted, we understand, by a Mr. Mason, an old and esteemed friend of the most unfortunate lady.

J. T. MCKAY.

#### Mode of Condensing Magnetism Analogous to the Condensation of Electricity.

M. Jamin.—The author has caused M. Limet to make for him a horseshoe-shaped magnet, made up of bars of perfectly homogeneous steel, and fastened together by means of bolts. When this artificial magnet is properly magnetized, it is capable of bearing a weight of 300 kilos. at the armatures. When this armature is placed so as to be only in contact with one of the steel bars composing the horseshoe, it appears that the magnetism of the nine other bars is very perceptibly diminished. Under these conditions, and notwithstanding the magnet was previously already saturated with magnetism, it is possible to saturate anew with magnetism, and make the horseshoe bear again 600 kilos. This experiment can be repeated: another armature may be put on, so as to bear only upon one of the component bars, and again, more magnetism can be condensed. The learned author has already succeeded in making the horseshoe bear another 680 kilos. in this manner.

#### An American Atlantic Telegraph.

The New York Times states that a number of wealthy and skilled financiers have for some time past been quietly working up the means and the programme for an American Atlantic cable, to proceed direct from New York city to Europe. This line will be worked with what are known as "sounder instruments"—that is, the alphabet is indicated by sound instead of by the galvanometer reflector system, as now used on cables, and can be operated three or four times as rapidly as can possibly be done by the present system. Two sets of these instruments were manufactured for this company some time since, and have been thoroughly tested both in Europe and America—in Europe through a circuit of 3,000 miles of insulated wire, and with the most perfect success. They are constructed upon entirely new principles, and are so far wholly unknown to the public. It is confidently expected that the project will be far advanced toward completion the coming fall. For prudential reasons the European terminus of the American cable is for the present withheld; but it is perhaps worth while

to mention that the consideration of amity, present and prospective, of any foreign government has entered into the calculation of the new projectors in the selection of a terminus. It is expected, indeed it is intended, that by constructing a direct line from New York city, and working it upon these plans, the company will be enabled to do business at rates scarcely, if at all, in advance of present rates on American land lines.

#### Scintillations from Scientific Authors.

BY MADISON BUELL.

The motion of heat interferes with the motion of electricity.

In 1748, Jallabert at Geneva, Switzerland, submitted invalids to electrical treatment.

There exist a host of daily phenomena which are evidently due to the continuous action of air and water.

Volta, the antitype of Prometheus, first enabled us definitely to relate the force of chemistry and electricity.

Bucholz was the first to show that metals may form with their own solutions and water, whether pure or acid or saline, electric currents, the action of which precipitates the metal.

Mr. Airy, the Director of the Royal Observatory at Greenwich, is, of all astronomers, the one who has directed his attention most continuously—and with the greatest success—to the application of the electric telegraph for astronomical purposes.

Almost all thermal springs suffer at the approach of storms a particular agitation, which is manifested by an extraordinary bubbling, or by other symptoms, which show the electric condition of the deep places whence they arise, and from which they have probably been borrowed.

M. Steinheil was the first who proved the fact of the transmission by the earth of voltaic electricity for telegraphic purposes. The conductor of the telegraph constructed at Munich in 1837, was formed of a copper wire, terminated at its two extremities by two plates of copper buried in the earth.

Who knows whether the noise which accompanies the electric explosion, and which constitutes the element of thunder—might not be due to the recombination of the water, decomposed by the propagation of electricity in the cloud? The decomposition and recombination might follow each other immediately, without leaving any other trace than the noise arising from the combination of oxygen and hydrogen.

Heat is not the clash of winds; it is not the quiver of a flame, nor the ebullition of water, nor the rising of a thermometric column, nor the motion which animates steam as it rushes from a boiler in which it has been compressed. All these are mechanical motions into which the motion of heat may be converted, but heat itself is molecular motion, it is an oscillation of ultimate particles.

THE editor of the Waterbury (Conn.) American telegraphed the other day to Col. A. H. Fenn, at Plymouth: "Send us full particulars of the flood." Fenn replied: "You'll find them in Geres's."

EVEN Tom Hood is inexcusable for such a description of music as this: "Heaven reward the man who first hit upon the very original notion of sawing the inside of a cat with the tail of a horse."

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, AUGUST 16, 1869.

### Special Telegraphic Service.

There has been, unquestionably, much progress made in the promotion of greater efficiency in telegraphic operations. This has been done, in part, by that unperceived skill which attends the prosecution of any pursuit, a certain dexterity which continued devotion to the management of a business or the manipulation of its details never fails to confer. In addition to this, however, there has been much deliberate study of whatever presented itself as needed or likely to secure perfection in the instrumentalities for the rapid and correct transmission of dispatches, as well as in the arrangement of the labor by which the telegraphic duties of the country are performed. The lines, to-day, present most gratifying proof that this attention has not been in vain, however much may yet appear unattained and imperfect.

New wants, however, arise as the telegraph comes to touch, as it must, more and more intimately both social and commercial life. Its more social uses, indeed, have scarcely had existence. These can not fail, in time, to be both numerous and various. Neither has the telegraph attained that certainty of instant service which is needed to satisfy contingencies which, every one knows, at some time or other arise in the lives of men or in the exigencies of their business. There are daily perils which greater assured celerity than the present system seems to permit would dissipate or relieve. If a citizen could be positively assured that within a certain number of minutes a message could be ensured delivery, or his correspondent brought into direct communication with him without delay, the telegraph could relieve many a great and overwhelming perplexity. There are critical periods in the affairs of merchants which an instant interview with a distant partner would enable them to pass unscathed. So in the thousand griefs and emergencies of social life, a message whose delivery could be assured within a certain number of minutes, and an answer obtained, would deepen the hold of the telegraph on the public mind by securing a relief more felt, and therefore more valued, because touching the more sacred emergencies of our homes.

The difficulty in making such a service as this possible has been the rule, indeed the State law, which requires that no message shall have preference over another, and that each must take its turn. This law is just and necessary. It has been carried out with very general fidelity. It should be maintained, how-

ever hard it bears on parties using the wires. An operator should have no right even to discriminate between the value of an invitation to tea, and the demand for a surgeon by a train about to start so as to save a precious life, however humiliating this subordination of his own sense of fitness may seem or be felt by him.

On railroad wires, the officers demand instantaneous service and have it. It is essential to them and to the public safety. We want to know how shall such a service be secured to the public which also has its dangers to be avoided, its perils to be met? We have heretofore resisted all proposals to introduce a service which would at all discriminate in favor of any call short of death or public justice. We have pleaded the justice of the law which requires that all must come alike and wait on each other as at a barber's Saturday night levee. We are now constrained to ask whether, even under the existing laws, it is not possible for the telegraph to meet the greater perils of society, which as in governmental dangers, demands the instant use of the telegraph wires.

The great panacea for telegraphic delays will, we have long been assured, ultimately be found in automatic machinery which shall have the power of transmitting, without personal manipulation, autographically, and with a speed which shall always secure a clear wire for every one who comes, except in cases of general public calamity, when men simultaneously crowd their communications upon the lines. That time is not far distant, and is as certain as the coming of the rain.

Until machinery of this enlarged capacity be introduced, there is only one other way in which we conceive it possible to perform service of the character under consideration, and that is by the provision of special wires for instantaneous service and by conveniences arranged for parties demanding distant personal conferences by the wires. The charges for such service would have to correspond with the cost of maintaining it. If a man's peril or profit will justify his paying four prices for the privilege of instant service which he may see performed, and get the evidence of it while he waits, he can resort to this extra wire. The service thus secured would often justify any cost. The law can operate on such a wire as on all others, each applicant taking his turn, and yet, by its exceptional employment, almost always securing the instantaneous use of it when required. The question is, are these exceptional necessities so frequent as to justify the provision of exclusive wires for this class of business? We think they are. The very provision of such facilities awakes attention and creates demand for their use. Such wires need not remain idle when not used for this special service. At night it can be utilized for the ordinary service. In many hours of the day they may be used. This general use will prevent loss, while at the same time they could be held ready for instant service whenever demanded.

In Europe this is largely done. In some Kingdoms no promptness is promised, or at all certain, without the payment of extra tariffs. The low foreign tariffs so much vaunted by our statesmen are largely shams.

They pay for a slow service, and parties desiring a dispatch are compelled to resort to ensured messages at higher prices. The old adage is true here as in many other things that "it is not all gold that looks like coin." We commend the subject of this special service to those whose duties lead them to study the arts by which telegraphic efficiency and adaptation may be secured.

### OFFICIAL STATEMENT.

#### Western Union Telegraph Company.

	June, 1869.	June, 1868.
Total Receipts.....	\$590,994 31	\$379,911 00
Total Expenses.....	381,546 85	353,375 50
Net Profits.....	\$209,447 46	\$226,535 50

### Return of Hiram Sibley, Esq.

After an absence of a year, the Cunard steamer *Russia* brought us back on Tuesday, the 3d inst., the veteran so long identified with the history of the Western Union Telegraph Company, when its stock went laughing at the rate of 200. Mr. Sibley returns much improved in health, a very portly, well preserved, very happy man.

A few days before his return, Mr. Cornell, Surveyor of the Port of New York, himself an old telegrapher, and as skillful at the key as any other man, invited a large circle of friends to accompany him on a revenue cutter to meet Mr. Sibley on the arrival of the *Russia* in the Narrows. Of course, everybody accepted. It was a very happy and jolly season. Everybody was happy. Mr. Sibley was in most radiant humor, and would we, had we not been unluckily absent on a recreative trip in the West. We believe in such receptions and especially when held on a Government steamer with such a jolly company and with so inspiring appurtenances. We welcome Mr. Sibley home. May his shadow never be less.

The Atlantic Cable Company have greatly added to the effectiveness of their land lines. Every month also improves the capacity of their two cables, one of which is used to send, while the other receives, the messages passing between America and Europe. The time occupied in transmission is thus reduced to the lowest minimum of which the art is at present capable. No one can complain of the remoteness of Europe when, telegraphically, its cities are brought as near to us as the villages on the Hudson.

By the circular on next page it will be seen that the tariff to Great Britain has been reduced to seven dollars and a half gold for ten words. Press messages half price.

CORRESPONDENTS who find their communications unattended to, and who miss expected matter, must charge apparent neglect to our absence in pursuit of health out in the clear air of the country. We will atone for all on our return.

### Married.

FARRELL—RYAN. At Georgetown, Ont., July 5th, by Rev. Father Dellabois, James F. Farrell, Manager Western Union Telegraph Office, Bay City, Mich., to Annie, youngest daughter of P. Ryan, Esq., of Georgetown.

**Rule No. 4.**

We have again to call attention to this rule. Offices are constantly in the habit of forwarding messages received from other lines without designating their own office so as to permit their being properly checked. This produces confusion, correspondence, labor and delay. Let each message bear distinctly upon it both its proper date and the name of the office where the one line delivers it to the other.

We sympathize with all who, tired of the hot stones of the city pavements, and the tug of daily toil, crave to see the green grass and smell the fresh air of the harvest fields. We have just left the iron seat of one of Wood's reapers after seeing a fine field of barley cut and laid aside ready for the wagon. What a grand shaking of the body corporate a ride on a reaping machine over a rough field gives! What an appetite it creates! How it drives out all superfluous gas! If some such invention could be provided for corporations by which now and then they would be shaken up, it would surely prove a sanitary process. As we write this by the light of the twilight, on the sill of an open window, with the new moon and the evening star shining before us, the low of homeward cows in the distance, and in hearing of the conversation of the harvesters as they water their tired horses before us, we feel all the delight which such circumstances seldom fail to impart to emigrants from the toil and noise of city life.

**The Simonds' Insulator.**

In a few hurried words respecting Mr. Simonds insulator which we found very handsomely illustrated in the *Scientific American*, we gave the idea that it was the fruit of a suggestion of our own. As the date of the patent appears to be as early as our own suggestion, and the thought of the device must have preceded the patent, we desire to give Mr. Simonds proper credit for his invention, and to recall any word of ours which might seem to detract from the merit of its invention. Our suggestion was crude and un-studied, but written under an impression that an advantage lay in that direction. We hoped that some one, perhaps Mr. Brooks himself, or Mr. Farmer, or some other electrician would give it what thought it merited. A cheap, durable, perfect insulator, even admitting the excellence of those in use, is still by many a demand. At least there must exist a desire for all possible improvements in an article so radically connected with telegraphic success.

One feature of the Simonds' insulator we overlooked in our notice of it. The glass bell is not a simple arc as in the ordinary insulator, but is made to arch down in the center and thus enters and is immersed in the paraffine cup which is supported on the pin. This gives continuity to the insulator until it reaches the outer edges of the paraffine cup. The merit of the insulator, therefore, would appear to be in retaining all the strength and economy of ordinary forms with the intercepting qualities of paraffine in such condition as to be retained.

An article from Mr. George B. Prescott is necessarily delayed until next number.

**Westbrook's Self Recorder.**

We regret to see among the list of patents one granted to our good friend C. Westbrook, for the transmission of messages by the action of a lever, the end of which by passing over the surface of the letters of the Morse alphabet indented on stout paper, performs, automatically, the process of manipulation. We regret it only because, some time ago we took special pains to point out that this very process was one of Prof. Morse's earliest devices, that it forms part of his early papers, and, if we mistake not, is one of the specifications in his patents. The same plan has been tried in Europe by the use of metal strips indented in a similar way and to accomplish a similar purpose. They have all been laid aside as not fulfilling the conditions desired, and, although apparently susceptible of profitable employment, have been regarded as methods for accomplishing celerity without promise of success and inadequate to the demand.

We have no doubt Mr. Westbrook supposed his invention original, and there is no one we could more heartily wish to be successful in any invention to which his mind may be devoted, but we feel that the patent office should not have accepted fees for a device it must or ought to have known was as old as telegraphy itself.

THE announcement by Mr. Payne of Newark, N. J., of his experiments with electricity for motive power, though poohed at by scientific journals, we are not inclined to laugh at. Mr. Payne has succeeded in developing enormous power by an application of battery very insignificant. He claims to have lifted a ton by a battery of nine cups with the face of a five inch magnet removed quarter of an inch from the mass. He is now constructing a 25 horse power engine which he expects to work with a battery of nine cups. If Mr. Payne succeeds in these experiments, he will solve the question of car power in cities, and a vast range of other uses to which electric power can be applied.

**The French Emperor.**

Napoleon III. has been presented by the American Institution of Civil Engineers with a diploma of honorary membership, which he has accepted with much apparent pleasure, as well as welcoming the gentlemen appointed to present it.

The French Emperor is a scientist of no mean abilities. His interesting paper on magnetism we have already published. In the manufacture of ordnance his skill is well known. Indeed, he has constantly under his private pay several men of science working out problems connected with the peaceful arts as well as the arts of war. In this he is an example to all rulers. His hardest task now is to reconcile the personal and popular power in safe and liberal government.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York.  
August 16, 1899.

**To all Offices on W. U. Lines:**

The following changes in tariff have occurred since August 1st, the date of the last tariff order. Please note them in your tariff books:

**NEW OFFICES.**

Duxbury, Mass., tariff same as Plymouth, Mass.  
Espytown, Pa., tariff same as Bloomsburgh, Pa.  
Kingston Springs, Tenn., reopened, tariff same as heretofore.  
Normandy, Tenn., tariff same as Tullahoma, Tenn.  
Rockbridge, Alum Springs, Va., tariff same as Covington, Va.  
Stepney, Conn., tariff same as Newtown, Conn.  
Trezevant, Tenn., reopened, tariff same as heretofore.

**NEW OFFICES ON OTHER LINES.**

Fishkill Village, 25 and 2; Hopewell, 25 and 2 and Washington Four Corners, N. Y., 30 and 2 from Fishkill. Check Fishkill.

**OFFICES CLOSED.**

Adams' Mills, O., Lowell, Wash'n Co., O., Milan, Tenn., Magnolia, Miss., and Mattituck, L. I.

**GENERAL INFORMATION.**

Rates to following offices on "other lines" have been made as follows, to take effect from receipt of this order:

Sioux City, Iowa, 60 and 4 from Missouri Valley Junc., Iowa.	
Onawa, Iowa, 40 and 3 from " " "	
River Sioux, Iowa, 35 and 2 from " " "	
Blair, Neb., 35 and 2 from " " "	

Hereafter the tariff to Hunter's Point, L. I., N. Y., will be 15c. more than New York city, and Hokendaqua, Kingston, Pittston, Slatington, White Haven and Wyoming, Pa., 25c. more than Philadelphia. Offices having "Special Sheet A" will use special rate to Philadelphia and New York when computing tariff to points named.

**Executive Order No. 79.****REDUCTION OF TARIFF ON ATLANTIC CABLE BUSINESS.**

On and after Tuesday, August 10, 1899, the rates of tariff on Atlantic Cable business will be as follows:

Tariff in gold, to any point in Great Britain and Ireland.

	For 10 words or less, counting address, date and signature.	For each word over 10
From all points in Nova Scotia, New Brunswick and New England States, and from New York City, . . . . .	\$7 50	.75
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia, . . . . .	7 80	.75
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Co.'s offices in Florida, . . . . .	9 00	.90
From Pensacola, Florida, . . . . .	10 00	1 00
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dakota, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California and Arizona, . . . . .	10 50	1 05
From all points in Oregon, Washington Territory and British Columbia, . . . . .	12 50	1 25
The additional tariff to places beyond Great Britain and Ireland will remain as heretofore.		

We are notified of the following modification of the rule relating to

**PREPAID REPLIES.**

Should a prepaid reply contain more words than the number specified and paid for by the sender of the original message, the additional words must be paid for by the sender of the reply on presenting it for transmission.

WILLIAM ORTON, President.

### The French Cable.

It is understood that the managers of the French cable have agreed to acquiesce in any conditions that Congress may prescribe upon the part of this country. We hope then it will be remembered that this Company enjoys an absolute monopoly for twenty years, and that it is a great deal better that this cable should not be laid at all upon our coast than that we should acquiesce in the monopoly. The *Evening Post* says that the objection to the landing of the cable is foolish, because it will certainly be laid upon the shore of Canada if we forbid it ours. That is very possible; but that does not implicate us, nor tie up the hands of American enterprise for the next twenty years. The *Post*, as the defender of a chartered monopoly, appears in a new role. For the sake of its own principles we hope that it may plead in vain, and that the assent of Congress to the French enterprise will be withheld until the monopoly is renounced.—*Harper's Weekly*.

### Platinum.

A few facts concerning this metal, put as it is to so many uses in telegraphy, may interest your readers. It strongly resembles silver in appearance, and it was, in consequence, first called Platina by the Spaniards, from their word *Plata*, signifying silver. It is distinguished as being the heaviest and most infusible of metals, is nearly twice as heavy as lead, and 22½ times weightier than water; but it is owing chiefly to the latter quality that it is used so extensively in the practical operation of the telegraph. It is not affected by the most intense furnace heat, and can only be melted by the oxyhydrogen blow-pipe, consequently we find it used in relay and key points, where it often remains unimpaired for years, successfully resisting the intense heat developed by the opening and closing of the electric current. Platinum is a little softer than silver, and of such remarkable ductility that it can be drawn out in a wonderfully fine wire. Wollaston obtained one not exceeding 1-2000th of an inch in diameter by filling a space in the axis of a silver wire with a small piece of platinum wire, then drawing this compound wire into the most attenuated form possible, and dissolving the silver from the outside, exposing a filament of platinum finer than a spider's thread.

The metal is worked with more difficulty under the hammer than cast steel, and when pure may be welded upon itself, or upon iron or steel at a white heat. In its chemical properties platinum is remarkable for resisting the action of the most powerful acids, as well as of high temperatures. On this account it is well adapted for chemical utensils, for plates and bands used by dentists for artificial teeth, and for retorts and stills in the manufacture of sulphuric acid. It is dissolved by nitric acid only when alloyed with a considerable proportion of silver. Its true solvent is aqua regia. When a perfectly clean surface of platinum is presented to a mixture of oxygen and hydrogen, it has the extraordinary property of causing them to combine, so as to form water, and often so rapidly as to render the metal red hot.

It was first obtained from the gold regions of Choco and Barbacoas, head of the Atrato River, South America. About 900 lbs. a year were sent from this region to Europe. Then from the island of Borneo 600 to 800 lbs. were exported. In the Russian gold mines platinum was noticed in 1819 by the miners, who called it white gold. Its true character was known by Professor Lubarski, at St. Petersburg, in 1823. It is also found in Estremadura, in Spain, and in very small quantities in other countries.

"In modern times platinum was first brought into notice by Ulloa, a Spanish traveler, 1735, but there

are reasons for supposing it was known to the Romans, and worked by them, and was employed by some of the alchemists. About the middle of the last century it was carried from South America to Europe. Several French silversmiths were among the first to apply it to useful purposes; some time after Wollaston devised the methods of working it which are still practiced.

Platinum is very scarce. It is found in grains and small lumps, and very rarely in nuggets of several pounds weight. It is found in the sands of gold deposits with a number of other metals, which are seldom if ever found, except with platinum. These alloys contain from five to ten per cent. of iron. Humboldt brought a large lump from South America and put it in the museum at Berlin. It is about the size of a pigeon's egg, and weighs 1,088 grains. In the museum at Madrid is a lump from Condoto, in South America, weighing 11,651 grains. In 1827 a lump was found in the Ural Mountains, near the Demidoff gold mines, weighing over 11 lbs. troy. In 1831 the largest piece known was found there—it weighs over 22 lbs., and is preserved in the Demidoff Cabinet. At Rutherford, North Carolina, a lump of 2,541 grains was found. D.

### A Revolution in Steam Engines.

The *Jersey City Times* has a description of a machine, now in operation in that city, which is destined to work a revolution in one department of mechanical industry—namely, a new steam engine, which, one-quarter of the weight, and occupying one-quarter the space required for an ordinary ten-horse engine, will give the same power with twenty-five per cent. less fuel.

This little machine sets at defiance all preconceived notions on the subject. Its motive power is all contained within the circumference of a broad, stout wheel, about three feet in diameter, revolving upon a hollow shaft which receives the steam and delivers it alternately into two opposite reciprocal cylinders, each fixed between the center and the periphery. The power, therefore, instead of being at the centre, presents the singular anomaly of being at the circumference. Or, in other words, the true center of power is at the periphery of the wheel.

To use a familiar simile, the wheel is like the band or drum of a squirrel cage, in which two squirrels were simultaneously, one in the usual position, the other in the opposite, but with his head down, and with a motion similar to that of a fly walking on the ceiling—both, of course, in continually reversing positions as the wheel turns. It is an application of the simple principle by which, as any one can see, a grindstone may easily be turned by placing the hand upon its surface, while only with considerable muscular exertion a man's hand grasping the shaft can produce the same motion.

The inventor, Mr. Ruset, a Frenchman, resided at Communipaw until quite recently, where he was well known as the author and patentee of several useful minor inventions.

The *Times* says it is expected that a stock company will be formed immediately for the manufacture of the Ruset Engine, whose value for all uses requiring lightness of construction combined with economy of fuel, may be seen by the simple statement that it will give ten-horse power with no more fuel than would be required in a caloric engine of two-horse power, occupying one-fourth of the space, and at a much less first cost.

THE French Atlantic cable opens for business to-day, August 15th. The Western Union Company have erected a line direct to Duxbury from New York to accommodate those who desire transmission by that route.

### Messrs. Gray & Barton.

The firm of *Shaw & Barton*, Electricians and Machinists, Cleveland, O., have dissolved, Mr. Shaw having sold his interest in the concern to Mr. Elisha Gray, an electrician well and widely known throughout the West, the new firm being now known as GRAY & BARTON. Mr. Shaw takes charge of the concern at Cleveland, O., as foreman, while the new firm attend to the establishment of a house in Chicago. During the short time the firm of Shaw & Barton has been in operation, we learn that they have met with marked success. It could scarcely fail to be otherwise. Good character, skill, fidelity, enterprise and a wide field, made success certain. We wish our friends ample success.

### The Effect of Charcoal on Flowers.

A correspondent of the *Revue Horticole* says, that not long ago he made a bargain for a rose bush of magnificent growth and full of buds. He waited for them to blow, and expected roses worthy of such a noble plant and the praises bestowed upon it by the vender, but when it bloomed all his hopes were blasted. The flowers were of a faded hue, and he discovered that he had only a middling multiflora, stale colored enough. He therefore resolved to sacrifice it to some experiments which he had in view. His attention had been directed to the effects of charcoal as stated in some English publications. He then covered the earth in the pot in which the rose bush was about half an inch deep with pulverized charcoal. Some days after he was astonished to see the roses which bloomed of as fine a lively rose-color as he could wish. He determined to repeat the experiment, and therefore when the rose bush had done flowering he took off the charcoal and put fresh earth about the roots, and waited for the next spring impatiently to see the result of this experiment. When it bloomed the roses were as at first, pale and discolored, but by applying the charcoal as before they assumed their rosy red color. He then tried the powdered charcoal in large quantities upon petunias, and found that both the white and violet colored flowers were equally sensitive to its action. It always gave great vigor to the red or violet colors of the flowers, and the white petunias became veined with red or violet tints; the violets became covered with irregular spots of a bluish or almost black tint. Many persons who admired them thought they were choice new varieties from the seed. Yellow flowers appear to be insensible to the influence of charcoal.

We notice from *Les Mondes*, June 17th, the few but interesting words written by the Rev. Father Secchi, S. J., to M. F. Mazoo, at Turin, on electricity:

"I believe that the true theory of electricity will result from the principle that electricity is not a motion (*movement*), but a change of the quantitative and dynamic equilibrium of the ether which constitutes the atoms of the substances, and that the propagation of such a change is brought about by the moving of the ether from one atom to another; this motion shakes, disturbs the ether of the atoms, and thus produces heat."

BEES.—The most curious instance of a change of instinct is mentioned by Darwin. The bees carried to Barbadoes and the Western Islands ceased to lay up honey after the first year. They found the weather so fine, and the materials for honey so plentiful, that they quitted their grave, mercantile character, became exceedingly profligate and debauched, ate up their capital, and resolved to work no more, and amused themselves by flying about the sugar houses and stinging the negroes.

## The Anderson Fund.

We invite a full and generous subscription to the fund for the benefit of the family of Mr. Anderson, of Memphis, whose sudden death we have already recorded. We appeal specially to those who are not members of the Insurance Association to interest themselves in this fund. His associates in Memphis have, with characteristic generosity, contributed a fund of \$140. Let there be an effort to quadruple that sum. Remittances may be addressed to D. R. Downer, Secretary, or to J. D. Reid, 145 Broadway, New York.

The following sums have already been received:

Martin Barth.....\$2	Miss Carrie A. Hinds.....\$1
Thomas Johnson.....2	Miss Henrietta Dieckmann..1
J. D. Reid.....2	John Gay.....1

## Why do they Die so Fast?

TAUNTON, July 13, 1869.

D. R. DOWNER, Esq., Sec'y.

Dear Sir:—Our association fully demonstrates to my mind the necessity of our examining into the cause of so many deaths among telegraph operators, and although you gentlemen do so much for our welfare I think you can do much more, if you will only give this subject your earnest attention. Is it close confinement to business, combined with excessive labor and extremely long hours of toil; or what is it? If we search the records of other associations of this kind (and there are many) I think we might reach a satisfactory solution, and our duty hereafter is plain before us. If any assistance of mine would be of service to you I would heartily give it as I feel there is a duty we owe to our brother operators. Very truly, yours,

JOHN A. WRIGHT.

THE *Manufacturer and Builder*, edited by John Phin, Esq., is one of the most welcome, largest and best edited journals which enter our sanctum. Almost every article is original, and at least one half of the entire contents is the work of the editor himself. Mr. Phin is a Scotchman, thoroughly posted, a hard worker, discriminating and just.

Chemical action in a definite direction and through a chain of particles produces electricity.

## What Chemistry Tells us of Life.

We clip from the *Scientific American* the closing remarks of the eloquent and forcible Faraday address of M. J. Dumas, delivered before the Chemical Society in London, June 17th. It shows that there is a boundary to human knowledge beyond which faith alone can guide:

"If I question the physiologist, on the subject of these millions, or milliards, of compounds, misnamed organic, of which the chemist transforms, reproduces, or creates at pleasure the species, he will reply to the three following questions: Are these compounds living? No! Have they lived? No! Are they capable of living? No!

"If I ask the chemist himself if these compounds belong to mineral chemistry—to the chemistry of raw (brut) substances, he will reply, Yes!

"Organized matter, not capable of being crystallized, but destructible by heat, the only matter which lives, or has ever lived—this matter, a subordinate agent of the vegetating power in plants, of the motion and sensation of animals, can not be produced by chemistry; heat does not give birth to it; light continues to engender it under the influence of living bodies.

"Every organized being is born of a germ; every plant from a seed; every animal from an egg. The physiologist has never seen the birth of a cell, excepting by the intervention, or as the produce, of a mother cell.

"The chemist has never manufactured anything which, near or distant, was susceptible even of the appearance of life. Everything he has made in his laboratory belongs to 'brut' matter; as soon as he approaches life and organization, he is disarmed.

"Thus for a century past, the empirical elements of matter have been recognized and separated; their combinations have been multiplied to infinity; physical forces have been brought back to a common origin—motion—and one has been at pleasure changed into the other; and yet

"Is the intimate nature of matter known to us? No! Do we know the nature of the force which regulates the movement of the heavenly bodies and that of atoms? No! Do we know the nature of the principle of life? No!

"Of what use, then, is science? What is the difference between the philosopher and the ignorant man?

"In such questions the ignorant would fain believe they know everything; the philosopher is aware he knows nothing. The ignorant do not hesitate to deny everything; the philosopher has the right and the courage to believe everything. He can point with his finger to the abyss which separates him from these great mysteries—universal attraction which controls 'brut' matter, life which is the source of organization and of thought. He is conscious that knowledge of this kind is yet remote from him, that it advances far beyond him and above him.

"No; life neither begins nor ends on the earth; and if we were not convinced that Faraday does not rest wholly under a cold stone, if we did not believe that his intelligence is present here among us and sympathizes with us, and that his pure spirit contemplates us, we should not have assembled on this spot, you to honor his memory, I to pay him once more a sincere tribute of affection, of admiration and respect!"

By motion, or arrested motion only, could the phenomena of magnetism ever have become known to us. A magnet, however powerful, might rest forever unnoticed and unknown, unless it were moved near to iron, or iron near to it, so as to come within the sphere of its attraction.

## STICKWELL &amp; CO.'S

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the piece. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 3OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor.THE STANDARD AMERICAN WORK ON THE TELEGRAPH  
MODERN PRACTICEOF THE  
ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS  
SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HUGHES, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SABINE.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. There are portions of the work which no operator can afford to be without."—*The Telegrapher*.

"From a careful perusal of this work we are assured that it supplies a long felt want. It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—*London Mechanical Magazine*.

"We cannot err in recommending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—*Journal of the Telegraph*.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS, PUBLISHERS, 28, 30, 32 Centre Street.

## DURANT'S

NONPAREIL RELAY,

A PRACTICAL

SELF-ADJUSTER

ON ALL ORDINARY CIRCUITS.

Price, \$30.

Mr. GEORGE E. SKIBERT, Western Union operator, 145 Broadway, says:

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a Self-adjuster in every respect."

For a full description of the construction and advantages of this instrument see Journal of the Telegraph of December 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office Order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,

Office and Factory, 85 Nassau Street,

NEW YORK CITY.

Agent for the sale of the Nonpareil Relay on the Pacific Coast,

Mr. STEPHEN D. FIELD,

San Francisco, Cal.

# Journal of the Telegraph.

## The Aerial Steam Carriage.

We have at last a description of the "aerial steam carriage" in San Francisco, of which we have heard so much by telegraph. The *San Francisco Times* describes it as follows:

The carriage, which is merely a large working model, is a balloon, shaped like a cigar, both ends coming to a point. It is 37 feet long, 11 feet from top to bottom and 8 feet in width. These are the measurements at the center of the balloon, from which point it gradually tapers off toward either end. Around the balloon lengthwise, and a little below the centre, is a light framework of wood and cane, strongly wired together and braced. Attached to this frame, and standing up as they approach the front of the carriage, are two wings, one on either side. They are each five feet wide at a little back of the center of the carriage, and do not commence to narrow down until they approach the front, where they come to a point. These wings are made of white cloth fastened to a light framework, which is braced securely by wires. The main frame is secured in place by means of strong ribbons, which go over the balloon and are attached to corresponding portions of the frame on the other side. To the frame at the hind part of the carriage is attached a rudder or steering gear, which is exactly the shape of the paper used in pin darts, four planes at right angles. This, when raised or lowered, elevates or depresses the head of the carriage when in motion; and when turned from side to side guides the carriage as a rudder does a boat. At the center and bottom of the balloon is an indentation, or space left in the material of which it is built, in which the engine and machinery are placed on framework. The engine and boiler are very diminutive specimens but they do their work handsomely. The boiler and furnace are together only a little over a foot long, four inches wide and five or six inches in height. Steam is generated by spirit lamps. The cylinder is two inches in diameter and has a three inch stroke. The crank connects by means of cog wheels, with tumbling rods which leads out to the propellers, one on either side of the carriage. The propellers are each two bladed, four feet in diameter, and are placed in the framework of the wings. The boiler is made to carry eight pounds of steam. When not inflated, the carriage weighs eighty-four pounds. The balloon has a capacity of 1,360 feet of gas. When inflated and ready for a flight it is calculated to have the carriage weigh from four to ten pounds.

An engineer's private trial trip was first made in the presence of the constructing engineers, several of the shareholders of the Aerial Steam Navigation Company, a number of the employes and residents in the neighborhood. The morning was beautiful and still—scarcely a breath of air stirring. The conditions were favorable to success. The gasometer was fully inflated, and the model was floated out of the building. In six minutes steam was got up—the rudder set to give a slight curve to the course of the vessel—and the valves opened. With the first turn of the propellers she rose slowly into the air, gradually increasing her speed until the rate of five miles an hour was attained. The position of the rudder caused her to describe a great circle, around which she passed twice, occupying about five minutes each time. Lines had been fastened to both bow and stern, which were held by two men, who followed her track, and had sufficient ado to keep up with her at a "dog trot." As she completed describing the second circle, a pull given to the head line, unintentionally, caused the rudder to shift to a fore-and-aft position when the model pursued a straight flight

about a quarter of a mile; she was then turned round, and retraced her flight to the point of departure; whence, being guided, she entered the building. The fires were drawn, and the first extensive flight of a vessel for aerial navigation was accomplished. The total distance traversed was little over a mile.

The following dispatch was sent to New York, recently:

"I lent you one year ago from to-day four dollars and eighty-five cents. If you have not had it long enough, please keep it one year longer."

We give the answer—

"Had forgotten it, and hoped you had. Let her run another year."

## SPECIAL NOTICE

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing  
TELEGRAPH AND ELECTRIC MATERIALS,  
that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLES;

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

**S. S. STAFFORD'S**

COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33 1/4 per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

**A. S. CHUBBUCK,**

HOTEL STREET,

(Adjoining the Post Office.)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

**CHAS. T. & J. N. CHESTER,**

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS.

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**CHESTER, PATRICK & CO.,**

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA,

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 14 Dey street.

THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 29th street,

New York.

Electrician of the Company.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET, PHILADELPHIA.

The guarantees of this insulator are :

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.

# JOURNAL OF THE TELEGRAPH.

VOL. II. NO. 19.

NEW YORK, SEPTEMBER 1, 1869.

WHOLE NO. 44.

## Telegraph Enterprise.

Another great European telegraph project is on foot. A company just formed in London has purchased with concessional rights, the following cables, namely: 1st, Denmark to England, from Sondervig to Newbiggin, actual distance 334 miles; 2d, Denmark to Norway, from Hirtshals to Arendal, actual distance, 60 miles; 3d, Denmark to Russia, from Moen to Bornholm, and Bornholm to Libau, actual distance, 304 miles; 4th, Norway to Scotland, from Egersund to Peterhead, actual distance, 270 miles; 5th, Sweden to Russia, from Grislehamn to Nystad, actual distance, 96 miles. Of these, the three first are already laid, and have been for some time working; the fourth is shipped on board ready for laying; and the arrangements for the fifth are in course of completion, and both the latter are to be laid at the risk and cost of the old companies. The new company undertakes the working, and will be entitled to the receipts from the 1st of June. The cost of purchase was \$2,500,000. The ultimate intention of the company is a connection with North America via the Russian dominions.—*Gas Light Journal*.

A CURIOUS letter has been received by the Academy of Sciences of Paris from M. P. Leroux, in which he showed that certain rarefied gaseous substances known to assume various colors when enclosed in tubes provided with conducting wires at each end and rendered luminous by an electric current, will present the same phenomena by mere induction—that is, by the influence of a current not passing through the tube, but close to it, and even with a certain interval between. In another paper, now sent in by the same writer, he endeavors to prove, not without some reason, that this induction must play some part in the luminous manifestations of the electricity of our globe, which have received the name of aurora borealis. The sheets of diffused light constituting them may, he thinks, be attributed to an electro-static induction, the seat of which seems to be in the upper strata of the atmosphere. A similar circumstance must, in his opinion, be the cause of the sudden illumination of the clear part of the sky by a flash of lightning, an appearance which had hitherto been attributed to phosphorescence in the atmosphere, whereas it appears rather to be the manifestation of the return shock in the upper regions. The electro-static induction of rarified gaseous masses seems to be instantaneously produced through the insulating shell of glass that surrounds them; for, in the author's apparatus, it is so generated by a toothed caoutchouc disk previously electrified and made to turn. The faster it spins round the greater is the luminosity produced. In the course of his experiments the author has remarked that glass might be charged with electricity with the same ease by gaseous conductors as by metallic ones. This is so true that he has been enabled to construct a sort of Leyden jar, in which the metallic armatures are replaced in strata of rarefied gas.

## That Wonderful Click.

We were not very far from St. Peter's Bay, with the shores of the Bras d'Or Lake on the other hand; and in less than half an hour, in a little clearing close by the edge of a pine wood we came to a solitary hut. Entering, we saw a well favored woman busy at some needlework, a table, with a couple of telegraphic hammers, a clock, some writing materials, and a fire, where a pot was, no doubt, cooking a little humble food.

"Can we send a message to Sydney?"

"Certainly," she replied: "will you write it there?"

She took the paper, and read my earnest request to the captain of the ship not to sail till the next evening; and, to my surprise, turning round, said:

"You need not be at the trouble to send this; the Tuscaloosa will not have finished coaling till to-morrow night, and will sail the next day for Newfoundland."

"Are you sure?" said I, with a heart leaping towards the good news. "How could you know it?"

"I knew it because the captain telegraphed this morning to the senior naval officer at Halifax to tell him so. This is a check station on the line, and as I sit at work I listen to the click, click, of the needle, and understand all it says."

Marvellous power and advance of science, never before to me more forcibly illustrated! Here was a woman at needlework, in a hovel in the backwoods, understanding, by a noise which might be mistaken for the scratching of a mouse in a cupboard, the thoughts of men distant hundreds of miles from each other; the medium of writing, and therefore of sight, cast utterly on one side, and that of the ear alone employed. Will the power of man over the material world ever go beyond this, annihilating distance by touch, feeling, sympathy, taste? Who would now dare to say no?—*Lost amid the Fogs*.

[Should this good woman have told what, as an official, she was supposed not to know? Did she not defraud the company out of the tariff of two messages by her use of knowledge passing to others? or is it too shoppy to suggest such a thought in connection with so pretty a story?

## A Cable to Germany.

Since the successful laying of the French Atlantic telegraph cable, says the *Baltimore Journal of Commerce* of 5th inst., the project of a German-American cable has been seriously discussed, and it is announced that the Prussian government proposes to lay a submarine cable between that country and the United States. The relations existing between this Government and the German States are as intimate (and certainly more friendly) as between it and the English and French governments, while the popular connection is very much closer. The great mass of United States securities are held by the Germanic family, and there is without doubt a stronger bias toward the great Republic on German soil than anywhere in Europe.

## The Propagation of the Electric Current.

By George B. Prescott.

MR. POPE'S VIEW.

Mr. Pope objects to the correctness of my criticism upon his assertion that the electric current is caused by the difference in tension between the two poles of the battery, and says that the leading modern electrical authorities, citing as such Messrs. Gavarret, Culley and Clark, view the matter in the same light as himself. Now, while I have no reason to question the ability of either of the above-named gentlemen as practical telegraphers, still if the theory of electric transmission is to be established, *not by the weight of evidence, but by an array of authorities*, I would rather rely upon the opinions of some of the more eminent electricians, such as Faraday, Tyndall, Grove, Muller or De la Rive. Before discussing the question of the propagation of the electric current, as I understand it, I will briefly review the statements presented by Mr. Pope. I quote from his recent communication in the JOURNAL:

"We know that if a wire is connected from one pole of a battery to the other, a current of electricity will pass through it. How could this happen if the tension were the same at both poles? As a familiar illustration, suppose two reservoirs connected by a horizontal pipe, the water standing at the same height in each, and filling the connecting pipe. In this case, the pressure being equal at each end, the water in the pipe remains at rest. Take a quantity of water from one reservoir and add it to the other, and the equilibrium is disturbed. The pressure becomes less at one end of the pipe and greater at the other, and a current flows through the pipe until the equilibrium is again established."

It will be observed, of course, that this is *no case of tension at all*. The water is carried through the pipe by the force of gravitation. The term tension applies to the case of reactive or resisting force, such as air heaving our under compression, or to the reactive force of a strained or twisted wire, as in the case of a stretched musical string, or a wire employed in a balance of tension. Surely Mr. Pope will not claim that the water in the depleted reservoir exerts any reactive force upon that in the full one!

I quote from Mr. Pope again:

"C. F. Varley, in his 'Report on the Condition of the Western Union Lines,' p. 73, gives a diagram showing the tension, or electro-motive force, upon a line with a battery at each end, and a closed circuit, on the American plan of working, which correctly represents the varying tensions in different parts of the line. The tension of the earth being considered as zero, the grounded pole of each main battery is zero, and there is a point on the line midway between the batteries which is also zero, one half of the line having a positive and the other half a negative tension, as long as the circuit remains complete."

The meaning of the word zero being naught or nothing, it occurs to me that a telegraph wire which depends upon a current due solely to a difference in tension, must be in a bad condition for business when the tension is at zero at both ends and in the middle!

Mr. Varley's diagram, alluded to by Mr. Pope, simply shows the strength of current in various parts of a leaky wire. The difference in the strength of current at various points on the line is due entirely to the amount of fluid which escapes into the earth through defective insulation. If there were no escape, the strength of current would be the same upon one part of the line as another.

## MOST PROBABLE THEORY OF ELECTRIC CONDUCTION.

In order to comprehend the most probable theory of electric conduction, let us commence at the simplest manifestation of the phenomena, which we term electricity, and trace it through its various stages from the static up to that of the continuous dynamic state called the electric current.

By the friction of two bodies of different natures they acquire a remarkable quality of attracting, when placed in their vicinity, light substances, such as small fragments of paper, small balls of elder pith, &c. To explain these phenomena it is assumed that the friction of the two bodies develops upon each a peculiar fluid, which is designated electricity. These two fluids being imponderable and invisible can only be known by the effects which they produce. One of the fluids we call positive, or vitreous electricity; the other negative, or resinous. A stick of glass rubbed with a piece of cloth charges itself with the positive fluid, and a stick of resin rubbed in the same manner charges itself with the negative. *The particles of the same fluid repel themselves and attract those of the other fluid.* A metallic conductor in contact with an electrized body charges itself instantly in all its parts with electricity, whilst a stick of glass or resin placed in the same condition electrizes only the point in contact. If we bring into contact two conductors of the same size, charged with different kinds of electricities of equal quantities, these two electricities of which the particles are possessed unite, and all trace disappears upon the two conductors.

If we place two metallic balls at the extremity of a glass rod, one electrized vitreously or positively, the other resinously or negatively, and then cause them to approach each other, an instantaneous spark is seen to shine between them, accompanied by a slight snapping, and immediately after they may be proved to have lost their electricity. This mode of neutralization can only occur when the electrized bodies are placed a short distance apart, but whatever the distance the contrary electricities may be neutralized on making communication between the two balls by means of an insulated conductor.

When the neutralization is brought about, either through the air with a spark, or through a conductor, the electricity is said to be in the *dynamic state* for the instant that this neutralization lasts. This denomination of *dynamic* is given to the state of movement in which the two electricities are supposed to be found when they are traveling toward each other for neutralization in opposition to the *static* state, or that of rest, in which they are found when they are separately accumulated on insulated bodies. The latter state is also named *electric tension*, and the former *electric discharge*.

The dynamic state may be *instantaneous* or *continuous*. It is instantaneous in the preceding case, in which the two electrized metallic balls are insulated, and consequently acquire no more electricity after that which they possess has once become neutralized. But suppose one of the balls to be in communication with a constant source of positive electricity, and the other with an equally constant source of negative electricity, the two electricities being constantly renewed in proportion as they are neutralized, there will be through this conductor an uninterrupted neutralization or a continued reunion of the two electricities, forming what is termed the *continuous dynamic state*, or *electric current*. A galvanic battery produces such a continuous supply of the two electricities, liberated at the two poles, and the telegraph wire serves as a conductor through which the neutralization goes on. This movement of the current, or rather the cause of it, is not to my mind analogous to the reactionary force of a spring in a state of tension; but more nearly resembles the union of two gases, as for example, oxygen and

hydrogen, which unite by their own affinity and form water.

De la Rive, who is considered an authority upon all matters relating to electricity, says: "The word propagation carries with it the idea of motion; and in my opinion electricity in motion is electricity in that state which results from the reunion or neutralization of the two opposite electrical principles. The more simple manner of looking into the propagation of electricity is to consider it in a conducting body by which the two poles of a voltaic pile are united. *The two electricities which are being constantly liberated at each of the two poles neutralize each other continuously in proportion as they are produced through the conductor and constitute the current.* The propagation of electricity in all cases takes place by means of the *neutralization of the opposite electricities* of the particles of the body through which the transmission is taking place—a neutralization that is always preceded by a molecular induction, that is to say, by the separation of these electricities in each molecule."

Grove, one of the best electricians in the world, and the inventor of the most highly esteemed telegraph battery ever used in this country, says that he "can only conceive *electric induction and conduction possible by the polaric change of the ultimate molecules that are supposed to exist.* The phenomenon of matter without weight forces itself upon our attention, and electric discharges are the necessary results of the sudden subversion of molecular polarization or vibrating movement of matter itself."

On the 23d May, 1833, Professor Faraday read a paper before the Royal Society on "a new law of electric conduction." He found that though the current passed through water, it did not pass through ice. Why not, since they are one and the same substance? Some years subsequently he answered this question by saying that the liquid condition enables the *molecule of water to turn round so as to place itself in the proper line of polarization*, while the rigidity of the solid condition prevents this arrangement. *This polar arrangement must precede decomposition, and decomposition is an accompaniment of conduction.*

Faraday's experiments on electrolysis had long filled his mind, and he looked into the very heart of the electrolyte, endeavoring to render the play of the atoms visible to his mental eye. He had no doubt that in this case what is called the *electric current was propagated from particle to particle of the electrolyte.* He accepted the doctrine of *decomposition and recomposition* which, according to Grothuss and Davy, ran from electrode to electrode; and the thought impressed him more and more that ordinary electric induction was also transmitted and sustained by the action of contiguous particles.

A wire may be looked upon as several series of molecules placed side by side, and the strength of the current depends on the number of molecules in the section of the wire, and the number of times they discharge in a given time. A small wire can produce as strong a current as a large one, provided its molecules discharge as much faster than those of the large wire, as the section of the large wire is greater than that of the small wire. Under the same electro-motive force, the rapidity of discharge is lessened when the connecting wire is long, but accelerated when it is thick. The resistance offered by a long series of molecules must be the sum of the resistances offered by each one; hence the longer the series, the greater the resistance. Again, one series can convey a certain amount of electricity with a certain facility; another series will convey as much with the same; the two will convey twice as much electricity as easily as one series conveyed the original amount. Or if one be made to convey as much as two, its molecules must discharge twice as

fast; and having twice the work to do in the same time, will offer twice the resistance. Hence, the more series we have, or the thicker the wire, the better does it conduct.

## STATIC INDUCTION.

When the telegraph wire at a distant station is opened (or disconnected with the ground), and is placed in connection with one of the poles of a battery, the other pole of which is grounded, at the instant in which the connection is made, a current flows into the wire, and if the insulation of the line be perfect, almost instantly ceases. The needle of the galvanometer makes a sudden deflection, and then returns to its position of rest. If now at one movement of the switch, the battery connection be cut off, and the line grounded, the needle deflects momentarily in the opposite way, and the charge given to the wire returns and goes to earth. In land lines the return current is very slight, but in submarine cables it is very marked. The return current shows that a telegraph line may be charged statically, and may be looked upon as a Leyden jar, the wire as the inner coating, the air or gutta-percha as the glass or dielectric, and the earth or sea as the outer coating. The static charge of which a line of telegraph is thus capable, shows that the electric force not only tends to propagate itself longitudinally, but laterally. The effect of lateral induction is to retard the time of delivery of a signal, and to prolong it, so that although it is a momentary signal at starting, it becomes a prolonged signal at its destination. Wheatstone's calculation gives a velocity of 288,000 miles per second for electric discharge. If signals were propagated at this rate, the time elapsing between the sending and delivery of a current, even on a line extending over one half the circumference of the globe, would be inappreciable. But in aerial lines, even only a few hundred miles in length, there is evidence that electricity does not propagate itself at anything like that speed, and in submarine cables the velocity scarcely reaches thousands of miles per second. The mere slowness of the current would not matter so much provided the signals were delivered as they were sent, but they are not. Each signal at the receiving station takes a longer time to leave the line than it did to enter it. Hence, in a very long land line, or in a cable, if the sender transmitted at the same rate as he does in short circuits, the signals would run into each other at the receiving station, and be undistinguishable. Time must be given to allow each signal to ooze out of the cable before another is sent.

Static induction is the principal cause of all the failures in the fast system of telegraphy by automatic processes. When these systems are tried upon short lines, or with resistance coils of almost any length, the experiments are perfectly satisfactory; but when they are put into operation upon lines extending between distant points they necessarily fail. I found by actual experiment, that upon a line 230 miles long, of No. 8 iron wire, giving about 14 ohms resistance per mile, that intelligible signals could be transmitted at the rate of 60 words per minute, and be distinctly recorded in the Morse characters upon chemically prepared paper; but when I tried to work over a line of 460 miles, having the same resistance per mile, the highest rate of speed I could obtain was 30 words per minute. When I endeavored to work at a higher rate than this the signals were elongated so as to run into each other. This rate of speed by the automatic process is not so rapid by nearly 20 words per minute as was obtained over the same length of wire by the Morse and printing instruments. The reason for this is that a very slight current will decompose the iron stylus and chemically prepared paper, used upon the fast system, and make a mark; and that as the stylus is connected with the line wire, and rests upon the

chemically prepared paper constantly, all currents traveling over the wire, whether strong or feeble, are recorded upon the paper. Hence the charge by static induction which precedes the actual current causes a mark upon the paper in advance of the true signal; and the return current continues the mark upon the paper after the true signal has ceased. Now while the static charge upon the wire is the same, whether the chemical or magnetic instruments are employed in working them; the effect is far less appreciable upon the latter, because the armatures of the electro-magnets may be adjusted above the influence of the feeble currents due to static induction, and only be affected by the strong currents due to conduction. If automatic instruments are ever employed, therefore, for producing rapid writing by telegraph, they will be used in connection with electro-magnetic and not with electro-chemical apparatus.

According to Sir William Thomson, the maximum speed attainable on an aerial land line of 2,000 nautical miles in length, and consisting of an iron wire one-fourth of an inch in diameter, would be 20 words per minute, and he has also established the fact that *the retardation increases with the square of the length of the line*. Accordingly, on a line 1,000 miles in length, the number of words would be 80; on one 500 miles, 320; and so on. Direct lines are not worked for distances much greater than 1,000 miles, and very seldom even for half of that distance. The maximum speed of telegraphy on short circuits has been 50 words; so that on a line 1,000 miles in length and one-fourth of an inch thick, about No. 4 wire, there is still a wide margin before the lateral induction would interfere. Most land lines, however, are not more than one-sixth of an inch thick, and in them the embarrassment would be felt nearly twice as much as in the line just mentioned. On a line 1,000 miles in length of No. 8 wire, it would be advisable to break the circuit half way; and resend at the mid-station by the use of a repeater. The whole would thus be worked as two circuits of 500 miles, and the speed of transmitting could be four times increased.

The maximum speed of signaling through the 2,000 miles of the Atlantic cable of 1858 was two and a half words per minute. The copper core had a conducting power somewhat higher than a No. 4 iron wire. According to the law of squares if the cable had been 1,000 miles, the rate of signaling might have been increased to 10 words; if 500 miles, 40 words; and so on. If the ratio of the thickness of the core to that of the insulating coating be kept the same, the number of words that can be sent varies as the amount of material employed, or as the square of the diameter of cable. Thus, if a cable be of the same make and of equal length as another, but twice as thick, four times as many words may be sent by it. The thickening of the coil alone is not all gain in the way of lessening embarrassment, for while the conducting power of the core increases with its section, the lateral induction increases with its circumference.

Numerous explanations have been given of inductive embarrassment. The charge at starting may be supposed to have two inductive channels to reach the ground, one through the core to the further end of the cable, and the other through the gutta percha. Electricity, when it has two channels, acts through each in the proportion of the facility offered it. If the gutta percha were thick and the core short, the facility offered by the latter would be infinitely greater than that offered by the former. There would then be no lateral induction, for the electricity would keep to the core. But when, as in long cables, it has some hundreds of miles of core and a quarter of an inch of gutta percha to work through, the rival channels stand more nearly on a par. At each point part of the electricity sent into the cable acts inductively through

the gutta percha, and the rest acts in the line of the core. This last is subject to this diversion as it moves along; hence, if the cable be long, the whole is for the instant absorbed in charging the cable statically and possibly only a part at a time. Such being the case, the further progress of discharge is effected not immediately by the force of the transmitting battery, but by the polarity induced by it in the particles of the gutta percha.

In aerial lines the lateral channel, the air, which is some twenty feet thick between the wire and the ground, offers much less facility for inductive action than in gutta percha cables. The lateral induction is consequently very much less. In insulated subterranean lines it is nearly as much as in submarine cables. They are consequently never used except for short distances, where they are unavoidable.

There is as yet no way of obviating lateral induction in telegraphic cables; but there are several ways of diminishing it. A material, such as india-rubber, whose specific inductive capacity is low, lessens the evil considerably. The tarred hemp used in cables also reduces the lateral induction. Some have suggested the use of a double wire in the cable, the second wire supplying the place of the earth, but this has been found to aggravate instead of lessen the evil.

#### WORKING THROUGH THE ATLANTIC CABLES.

Electricity, in passing through a cable, begins instantly to appear at the distant end, but in strength far too weak to be measured. After the lapse of a certain time, definite for each particular cable, it begins rapidly to augment in power, and continues to approach to a definite limit of strength. On connecting one end of the cable to a battery whose other pole is to earth, no sensible current is visible until after the lapse of the period,  $a$  (this quantity,  $a$ , being a definite time dependent upon the dimensions of the cable), when the current has the strength of a little more than a thousandth part of that which the battery is capable of producing. When the cable is fully charged, the current attains its maximum strength. After the lapse of  $4a$ , the strength of the current is about one-fourth of this maximum power. After the lapse of  $6a$ , it has the strength equal to half the maximum, and for greater periods of time the strength of the current goes on augmenting, if the battery be continually applied. But although it approaches to, it never actually attains the absolute maximum. After  $20a$ , for example, the strength of the current is about 98 per cent. of the maximum. It is evident that in order to get rapid signaling through an Atlantic or other long cable, the apparatus must first of all be very sensible, so as to give as early indication as possible of the arrival of the electric current, and the moment such indication begins to be produced, the line must be discharged as quickly as possible, in order that a second signal may be made to follow quickly afterwards.

The battery employed in working the Atlantic cables is a modification of Daniells'—twelve cells are sufficient for signaling, but from twenty to thirty are generally used. The receiving instrument is Thomson's Reflecting Galvanometer. This consists of a needle formed of a piece of watch spring three-eighths of an inch in length. The needle is suspended by a thread of cocoon silk without tension. The needle lies in the center of an exceedingly delicate galvanometer coil. A circular mirror of silvered glass is fixed to the needle and reflects at right angles to it in the plane of its motion. It is so curved that when the light of a lamp is thrown through a fine slit on it, the image of the slit is reflected on a scale about three feet off, placed a little above the front of the flame. Deflections to the extent of half an inch along any part of the scale are sufficient for one signal. In so delicate an in-

strument the sluggish swing of the needle in finally settling into any position would destroy its usefulness. To rectify this, a strong magnet, about eight inches long, and bent concave to the instrument, is made to slide up and down a rod placed in the line of the suspending thread above the instrument. This magnet can be easily shifted as necessity may require. The oscillations of the needle due to itself are, by the aid of the strong magnet, made so sudden and short as only to broaden the spot of light.

In 1862 Mr. Varley invented a plan for expediting the signals through the cable, and for cutting off the disturbances arising from the aurora borealis.

The following extract from Mr. Varley's lecture before the Royal Institution of Great Britain on the Atlantic Telegraph will explain the apparatus employed for this purpose:

The speaker explained the plan he had invented in 1862 for cutting off the disturbances arising from the aurora borealis, and which were generally designated magnetic storms. These currents do not change suddenly like electric signals, but go *gradually over from positive to negative*. The speaker had constructed an apparatus for imitating these currents. An annular trough containing sulphate of zinc solution was connected at opposite points to the earth and to the cable (through the telegraph key). A fly clock rotated the crossbar as shown by the arrow in the diagram. From this crossbar depended two pieces of amalgamated zinc connected with the two poles of the battery, when the latter were at right angles to the line connecting the cable with the earth; viz.: as in the figure, no current flowed into the cable; on its moving  $180^\circ$  more the current had changed sign and reached its maximum negative. This apparatus performed the half revolution in 40 seconds. At the Newfoundland end of the cable, a reflecting galvanometer was placed between the earth and the cable, whilst a second galvanometer was placed, on Mr. Varley's plan, between a condenser and the cable, the other pole of the condenser being connected with the earth. The moment a current began to arrive at the distant end, it was shown upon both galvanometers, but as soon as it had acquired a uniform strength, the condenser being charged to that strength, cut off all further electricity, and the second galvanometer returned to zero, while the first one remained deflected. The amount that the second galvanometer was deflected did not depend at all upon the amount of current passing through the cable, but simply upon the rate at which its potential varied, and according to which the condenser charged or discharged itself. The earth currents sent the ordinary galvanometer image running from right to left twenty or thirty feet, right off the screen in fact, but the other one simply moved three inches, because the rate of variation of potential being slow the condenser charged slowly.

The effect of the condenser on the latter galvanometer is at the first moment to offer no resistance to the passage of the electric current. Suppose a current of a force 1 to arrive at the distant end, the current splits, part running through the galvanometer, D, to the condenser, the other through the galvanometer or resistance, B, to the earth. As soon as the condenser becomes charged to the power 1, the current in D ceases. If ever the current increases from 1 to 2 the condenser, E, will become charged to 2, and while charging the galvanometer, D, will indicate the presence of a current; but as soon as the condenser is charged with the same power as the cable, the current in D ceases. Thus then the galvanometer and condenser, D, E, do not measure the strength of the current flowing through the cable, but simply indicate alterations of the potential.

Suppose the cable and condenser charged to a potential of 100, D would show no current; if any-

thing suddenly augmented this potential to 101 the condenser would be charged to 101, and the variation of potential would be indicated. Suppose now that the charge were decreased from 100 to 99 the potential of the condenser would be reduced to 99 by discharging itself into the cable, producing a current in the opposite direction of a power of 1.

Thus then the strength of the current in D is entirely dependent upon the increment or decrement of potential, and not upon the strength of the current flowing through the cable. Suppose now an earth current of a power of 100 to pass from + to - in 60 seconds; a signal through the Atlantic cable is produced in about a

quarter of a second. If the strength of the signal be but 1-10th of that of the earth current, yet as the variation is 240 times greater, the signal while it lasts will be 24 times as strong as the earth current, and so the weak rapid current produces a signal, while the strong, but slowly changing earth currents, produce one too feeble to interfere.

The speaker demonstrated this by sending signals through the artificial Atlantic cable, from a very much weaker battery than that used to produce the earth currents; however, the rate of augmentation of potential of these small signal waves being much greater than the rate of variation of potential of the great earth current wave, sharp, clear signals were produced upon the second galvanometer. So by this extremely simple contrivance the small ripples upon the back of the big earth current wave were, practically speaking, entirely detached and clear signals produced, which despised altogether the great swell which had rendered the first instrument altogether useless.

The alphabet employed in working the cable is made by opposite movements produced by one or other of the keys. The signal need not be made from zero as a starting point. The eye can easily distinguish at any point in the scale to which the spot of light may be deflected, the beginning and the end of a signal, and when its motion is caused by the proper action of the needle or by currents. It is thus that the mirror galvanometer is adapted to cable signaling, not only by its extreme delicacy, but also by its quickness. The deflections of the spot of light have been aptly compared to a handwriting, no one letter of which is distinctly formed, but yet is quite intelligible to the practised eye. Signals in this way follow each other with wonderful rapidity. A low speed—some eight words a minute—is adopted for public messages; but when the operators communicate with each other as high a speed as eighteen or twenty words is attained. In fact it is said that the only limit is the power of reading, not transmitting, signals. When a succession of signals are sent into the cable by alternately depressing and elevating the key for periods of five seconds each, these impulses produce waves which can be distinctly traced. Various methods of clearing the cable after each impulse have been devised. In 1853 Mr. Varley invented a plan which consisted of sending after each positive current, a negative current, a plan which is now generally used in working submarine lines. In 1856 he invented another which consisted of sending a strong positive current of definite strength and duration into the line, followed by a weak positive current to produce a signal; this being followed by a strong negative retreat, suc-

ceeded by a weak negative current to clear the line. This system was a great improvement upon the former. In 1858 Professor Sir William Thomson proposed the use of three currents of equal duration but irregular strength and alternate signs, which produced a still more rapid result. In 1863 Mr. Varley found by experiments upon an artificial cable, that by using a succession of four or five currents all of the same strength but varying in duration, greater rapidity could be secured. For example: first, a positive current, followed by a negative of longer duration, followed again by a positive current of much less duration, then a shorter negative current, and that again by a very short positive current, produced a succession of positive and negative waves throughout the line, the result of all of which was at the farther end, the production of one very small positive wave perfectly distinct, the rest of the line being left almost immediately entirely free from all traces of electricity and ready for the production of a second signal. In the previous experiments, when an impulse had been given, the charge had to find its way to the earth through the two ends of the cable.

By experiments on actual cables Mr. Varley had at an early date ascertained that the rate of transmission through a cable is independent of the potential or the electro-motive force of the battery, and that it varies inversely as the square of the length of the cable, excepting in the case of very short cables thickly covered with iron, where the retardation caused by the magnetic inertia of the iron forms an item of some importance.

Professor Thomson ascertained by mathematical reasoning that the strength of the current at the distant end varies in proportion to the time that the battery is continued at the transmitting end; and that with a given potential there is no possible means of expediting this rate of arrival; and, therefore, in order to get high speed, very sensitive instruments must be used, and so soon as a visible indication has been produced at the distant end, the cable must be cleared of its charge so as to admit of a second impulse or signal being given.

The instrument known as the curb key seems to carry this to the utmost limit, and its success depends upon the following consideration: If the line be cut in half the speed of transmission is increased four times. If now one-half the cable were made positive while the other half was made negative, it is clear that while the first quarter of the cable which was negative is discharging to earth, and while the last quarter of the cable which was positive is discharging to earth, the two intermediate quarters would discharge by rushing into each other, consequently the electricity having a shorter distance to travel, the discharge is effected much more quickly. The curb key is not at present used upon the Atlantic cables on account, as I understand, of some disagreement in regard to the patent. Should the business over the cable, however, increase so as to require a more rapid rate of transmission, it is probable that the curb key will come into use.

#### Artificial Coloration of the Electric Spark.

Mr. E. Becquerel has shown that the electric spark may be diversely and beautifully colored by being made to pass through saline solutions. If an electrical spark from an inductive apparatus be made to pass into the extremity of a platinum wire suspended over the surface of the solution of a salt, this spark will acquire special coloration according to the chemical composition of the solution traversed. The saline solutions are best concentrated and the platinum wire positive. The experiment is rapidly performed in a glass tube.

#### Preservation of Telegraph Poles.

Many attempts have been made to increase the durability of wood by the injection of certain solutions, especially that of sulphate of copper. On this subject the French Academy of Sciences has received an interesting paper by M. Maurice Boucherie. He states that, when properly effected, the injection of the above mentioned solution is always beneficial; and that the best way to perform it is by displacing the sap and then letting the wood dry in the air. To prove this assertion, M. Boucherie sent in with his paper a few samples of railway sleepers laid down in 1847, after being prepared in the way mentioned. They had been taken up but a short time ago, and were in excellent preservation. They were found to be harder to saw than any common dry wood. Their resistance was equal to that of green wood, and their elasticity had been preserved unimpaired. Our author contends, however, that it is not the excess of sulphate of copper to which they owe their excellence, but to the combination of oxide of copper with the cellulose of the wood. To show the truth of this, he remarks that, if the latter material, or linen or cotton cloth, be impregnated with cupric solutions, and afterwards washed in much water, until none of the metal salt be left, it will nevertheless be found that such substances will remain uninjured, however long they may lie buried in the earth; and that if they be afterwards treated with ammonia, oxide of copper will be obtained from them. It is well known that the continual contact of the iron chair with sleepers is injurious to the wood, and yet in the present case it has not been so, the wood having been used when perfectly dry after being saturated with the copper solution. The latter is rarely absorbed if the wood contains more than six per cent. of sulphate of iron. The nature of the soil in which the sleepers are laid exercises a great influence on their preservation. Thus wood injected with sulphate of copper will not last long in calcareous soil or in tunnels. Cupric salts are now extensively used for telegraphic wire posts.—*Morgan's Brit. Trade Journal.*

#### Lighting up the Track.

Mr. Morse claims to have made several valuable discoveries and improvements in connection with the electric light. One invention claimed by him is a self-sustaining battery, and another is the device for making the carbon points, used to give the electric light, burn for months without wasting away. This electric light, it is said by those who have experimented with it, will cast a shadow behind an opaque body at a distance of ten miles, but when jarred by the motion of the locomotive, the intensity of the light is diminished. The light will illumine the track three miles ahead, however, so that where the road is straight the engineer can see any object at that distance. By another ingenious device, the electricity used to run the lamps will be collected by the friction of the wheels as the trains are in motion. Two lamps will be used for lighting Bergen tunnel, with one in the middle, as the tunnel is not straight but curves. Other lamps will then be stationed at each end of the Pavonia Ferry, which will throw a broad belt of light across the North River every night, to guide the traveler safely to his home in the metropolis. These lights will, it is said, be so intense that on the darkest foggy night there will be no danger of collision on the water any more than in the day-time. Still more, it is proposed to fill Twenty-third street every night with a flood of white light, from the North River to the Fifth Avenue Hotel, so that travelers at the heart of the metropolis may at all times be reminded of the broad and happy way.

**An Important Admission.**

THE case of Playford v. The Electric Telegraph Company is probably one of the last cases we shall hear of to recover damages from a company for a mistake in a telegram; but the point raised was curious, though the case cannot be of much importance now as a precedent. The plaintiffs having a cargo of ice at Grimsby invited an offer from merchants at Hull for it, and the latter telegraphed that they would give 23s per cwt. This price the Telegraph Company made 27s, and the plaintiffs at once sent the cargo to Hull to their great loss. In an action against the Company, however, to recover that loss, it was decided that the plaintiffs could not maintain it as the contract to send the message was not with them. Such a decision undoubtedly reveals a great imperfection in the law. Either the receiver of the telegram should be entitled to recover damages for the wrong doing of the telegraph company in a matter where they certainly had an interest, or the company should be considered the agent of the sender of the message, so that the plaintiffs would have been entitled to hold the sender responsible for the message as delivered, his right of action against the company being undoubted. *But the law is ceasing to be of practical interest, when the public are about accepting an agency from which no damages will be recoverable.* We may suggest, however, that the telegraph department *ex gratia* should create an insurance fund for mistakes in messages. The liability to fatal mistake is much greater with telegrams than with letters, and this is a good practical reason for not applying to it the Post Office rule of no damages for mistakes or delay.—*London Economist.*

"Mr. JOHN DUNN, of Philadelphia, representing the International Typographical Union of America, presented a preamble and resolution denouncing the Associated Press and Western Union Telegraph news monopoly. The Convention suspended the rules to hear the communication read. It declares that the alliance between the Associated Press and Western Union Telegraph Company is inimical to the interests of the workmen; that by its rules newspaper enterprise is thwarted and competition prevented. As a remedy for this evil a postal telegraph is recommended. The design of the International Union is that this Convention should, by memorializing Congress, take the initiative step in breaking down the alleged monopoly.

"The paper was referred to the Committee on Platform."

Mr. Dunn is unnecessarily afflicted. There is nothing in the arrangements of the Western Union Telegraph Company half so monopolizing or so arbitrary as the Union he represents. The contract with the Press is one of the most liberal character. A vast quantity of news is given at actual cost. That every Press in the United States does not obtain the news it transmits is no fault of the Telegraph Company. It refuses its wires to no one. Any association can arrange with it if compensating terms are given. The terms now charged are at their minimum, and with a sacrifice of the use of wires which could not be increased without special compensation. With Press combinations it has nothing to do. Presses combine for economy and protection as Typographical Unions do to raise prices of labor.

What the Typographical Union would secure by a Government Postal Telegraph system, it is hard to imagine. A Postal Telegraph would not prevent Press combinations, which are necessary to secure news to any satisfactory extent. No single Press could bear the actual cost of transmitting the matter now sent. No honest company can supply it for less, and Government could not. No Government or private telegraph company could supply each Press with

news except on some general understanding as now exists. No one would be satisfied to have a government official prepare the news for the country, and peddle it broadcast. It could not be tolerated, and would not be borne, except by weak and spiritless concerns if thus they could secure cheap news. The present arrangements with the American Press are of the most liberal character, and the matter provided is by the agents of the Press, who alone can be trusted with its provision.

**Resignation of T. B. A. David, Esq.**

We regret to hear of the resignation of Mr. David, the worthy ex-superintendent of the 4th District, C. D., of the Western Union Telegraph Company. His name has been associated with our own labors, in bye-gone years, so intimately, as to make us feel a special sorrow that the relations are now broken. Genial in his manners, kind and considerate to all under him, devoted to his duties and loyal to his trust, Mr. David was held in the highest esteem by both the General Superintendent and the Executive Officers of his company. He retires with the universal regard of all his subordinates, to engage in new duties where the opportunities of personal advancement are greater than they ever can be in a salaried position. We hope he may realize all the benefits which have decided him to enter into his new engagements.

M. Becquerel was the inventor of the differential galvanometer, which is an instrument capable of comparing the relative force of two currents.

THURBER—MANUS. In this city, on the 12th inst., by the Rev. Dr. Corbett, H. Frank Thurber, of the Western Union Telegraph Company, to Miss Lillie Rosealie Manus, both of this city.

SANDFORD—BRADFORD. At Trinity church, Mobile, Ala., August 10, 1899, by Rev. Dr. J. A. Massey, William Sandford of North Carolina, Manager of the Mobile office of the Western Union Telegraph Company, to Miss Moina M. Bradford of this city.

**Report of the French Telegraph Commission for the Perfection of Telegraphic Machinery.**

1. A new battery by M. Callaud. This is the battery of Leclanche with sulphuric acid as a substitute for the peroxide of manganese. The commission acknowledge that the change secures "a stronger polarization."

2. M. Daussin exhibits machinery to place any two offices in direct connection, but is rejected because possible by simpler mechanism.

3. M. Boue Castel exhibits an autographic apparatus, which is regarded as defective in synchronism. The first attempts at autographic machinery produced the characters in white on a colored ground. Apparatus now in use produce with common ink perfect autograph copies of dispatches at a rate equal to the best telegraph machinery in use.

4. Commutation or switch key, by M. Robert. Connections regarded good, but regarded as defective when used to write on several wires at once.

5. M. Guillemin read a paper on the accumulation of electricity from batteries and regulating its use.

6. To illustrate a new electro-magnetic machine presented by the Alliance Company, a cable was ordered by which to conduct a suitable examination.

The Commission then repaired to the Hall of Experiments to examine the Hughes apparatus upon which M. Rouvier has made a modification of great importance, having in view the increase in the rate of transmission 60 per cent.

**Brigham Young's Family.**

The New York *Tribune* publishes the following, in which a telegraph superintendent figures as a son-in-law of Brigham Young:

The number of Brigham's living wives is eighteen, exclusive of those who are merely sealed to him for the next world, and forty-nine children. Among the latter are a bevy of as handsome young girls as can be found anywhere. These are, of course, in demand, and they are marrying off pretty fast. Sometimes he gives more than one of them to the same man, as for instance, to the Superintendent of the Western Union Telegraph Office, who has two of Brigham's daughters, and is doubly a son-in-law of the Prophet. It is said that the old gentleman has recently made it a rule that whoever marries the last daughter of one of his wives, shall take the mother home also.

In a note enclosing the above we find the following, which we do not pretend to explain:

"This story probably arises from the fact that an operator there has two wives, reported as distant relations of Brigham Young. The same L. L. C. has a wife in Denver who runs a bagnio."

We are sure that this neither refers to our friend Ed. Conway, Superintendent of the District, nor to Mr. Pomeroy, Manager of the office at Salt Lake. There may be some consideration due to a man who can manage so many wives.

THE concessions required by the company organized to connect the telegraphs in British India with French Cochinchina have been accorded. The line starting from Bangkok will extend via Siam and the Cambodge to Saigon, to be eventually continued to Cape Saint Jacques or Cape Padaran, and from thence by submarine cable to Hong Kong.

# Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1897. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. o of other telegraph companies and their stockholders.

## TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,

Executive Rooms, Western Union Tel. Co.,

145 Broadway, New York.

NEW YORK, SEPTEMBER 1, 1899.

## Atlantic Cable and Cuba Business.

The attention of Superintendents and Managers is directed specially to Executive Order No. 80, giving the present tariff on Atlantic cable and Cuba business, and a complete summary of rules and regulations. Note particularly that the rates to France are the same as to Great Britain and Ireland, and that the rates beyond Great Britain are reduced. Note also instructions in regard to accounts and remittances.

Attention is also called to the circular of the Tariff Bureau which, as it gives the initiatory directions respecting the new system, demands careful examination.

## A Correction.

The *Public Ledger* of Philadelphia, in its money article on the 11th inst., noticing the annual report of the President of the Western Union Telegraph Company, says:

"It will be remembered that this Western Union Company has absorbed all the leading lines of the country, and has otherwise added much to its nominal capital by frequently and largely watering its stock, and in issuing stock to patentees, which have now, so far at least as Prof. Morse is concerned, entirely expired. These facts are proper to mention here, 'because it is pretty well understood that the Western Union Company will press upon Congress, at its approaching session, the propriety of the Government's purchase of the Company's entire interest, and of establishing the business of telegraphing wholly under Government control, as the Post Office Department controls the mails.' The Company's florid report will therefore be taken, with this purpose stated, *cum grano salis*."

We are allowed to extract the following from a private letter written by the President of the Western Union Telegraph Company, addressed to the proprietor of the *Ledger* in reference to the foregoing:

"If the action of this Company has been pronounced in any respect during the past two years, it has been especially so in its open and vigorous opposition to any interference whatever by our Government in the telegraph business. We have not only *not* endeavored or desired to sell our lines to the Government, but we have opposed all legislation to that end. What our course will be in the future may be inferred from the past, and this allegation of the *Ledger* is utterly groundless."

To this we add that the statement that Professor Morse's stock interest in the telegraph has expired is equally incorrect, Mr. Morse still deriving a considerable share of his income from that source. We are a little curious to know how a stock interest can *expire at all*, and why the stock issued to Professor Morse should be less sacred had it been transferred to other parties, instead of being retained as his own. Such wild statements are surpassingly strange in a paper so usually careful as the Philadelphia *Ledger*.

## OFFICIAL STATEMENT.

### Western Union Telegraph Company.

	July, 1899.	July, 1898.
Total Receipts.....	\$593,670 01	\$601,730 61
Total Expenses.....	412 895 02	396,163 66
Net Profits.....	\$180,774 99	\$205,566 95

### Executive Order No. 81.

#### PRESS BUSINESS.

ANSON STAGER,  
THOS. T. ECKERT,  
JOHN VAN HORNE, } *Gen'l Superintendents.*

It is very desirable to have complete and reliable data of the amount of business done by this Company for the Press. To obtain this information you will please instruct all offices in your Division to forward to the Auditor through the District Superintendent with the monthly account current, commencing with account for September, 1899, a detailed statement of all receipts from newspapers, or newspaper agents, whether on regular or special reports, and whether checked or otherwise. This statement should be made in the following form:

Statement of Receipts for Press Business at \_\_\_\_\_ office,  
Month of \_\_\_\_\_ 1899

Names of Newspapers.	REGULAR REPORTS.		SPECIAL DESPACHES.	
	No. of Words.	Am't Paid.	No. of Words.	Am't Paid.

Where regular or special reports or despatches are received, on which no collections are made, or which are paid for elsewhere, by contract or otherwise, a statement thereof must be sent in addition to the above, giving name of newspaper, number of words, regular and special, and place from which report is received.

WILLIAM ORTON, President.

### The Tariff Circular.

We commend special attention to the circular of the Tariff Bureau, which will be found in the present number of the JOURNAL. There is evidence constantly appearing that many offices do not make these circulars of any use in transmitting their business. Such offices are sure to be marked. Ignorance of the tariffs will show itself in errors in the check sheets, and can not but be injurious to the reputation and standing of a manager.

In the present circular let there be no want of care. It inaugurates a change which must exceedingly simplify the understanding of tariff rates. The rules are clear and ample. Let us restate them here to aid a correct understanding:

1. To find the tariff to any office of the Western Union Telegraph Company, turn to the name of that office and find the number of the square printed at its side. By referring then to that number on the square sheet the tariff will be found.

2. If the office have a \* at its side, you will know that it is an office of another line, and that the tariff to it will be found in Part II. of the book. Here you will find the name of the connecting office through which the message is to be sent and the tariff charged on the "other line." To this add the tariff to the connecting office which will be found in Part I.

Nothing could be simpler. Let there be general attention given. Remember to post up your tariffs in pencil.

## EXECUTIVE ORDER NO. 80.

### Atlantic Cable and Cuba Business.

This order contains complete instructions in relation to cable business, and supersedes all previous orders on this subject.

### TARIFF AND RULES FOR ATLANTIC CABLE BUSINESS.

Furnished by the Anglo-American Telegraph Company.

### All Messages must be Prepaid.

TARIFF IN GOLD TO ALL POINTS IN GREAT BRITAIN, IRELAND AND FRANCE.

For 10 words or less, counting address, date and signature.	For each word over 10
---	-----------------------

From all points in Nova Scotia, New Brunswick and New England States, and from New York City, From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia, .	\$7 50	.75
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Co.'s offices in Florida, .	9 00	.90
From Pensacola, Florida, . . . .	10 00	1 00
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dakota, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California and Arizona, .	10 50	1 05
From all points in Oregon, Washington Territory and British Columbia, .	12 50	1 25

#### RULES FOR BUSINESS WITH GREAT BRITAIN AND IRELAND.

RULE 1.—CHECK. You will state in the check:

1. The number of words in the entire message, including address, date and signature.
2. The amount charged.

RULE 2.—COUNT. The address, date and signature must be included in the count, and charged for.

The name of sender, and "place from," should form a part of every message, but this will not be absolutely required. Should the sender omit the "place from," it must be sent with the check. The sender is responsible for an insufficient address, and corrections or alterations can be made only by a new message, which must be paid for.

Compound names of places, including names of Countries, States, Islands, Cities, Towns, etc., and compound words, count as one word. Names of individuals, firms, vessels, streets, and all other names count for as many words as they contain. The prefixes d' or de, and l', le or la, before names of INDIVIDUALS, will not be counted separately. In other cases they will be charged as single words.

F. O. B., when written thus: "fob," counts as one word; but when the letters are separated thus: "F. O. B.," counts three words. C. I. F. and C. F. L. (cost, freight, insurance), whether written together or separate, must be charged as three words each.

Figures in ordinary messages must be expressed in words. The charge will be for the number of words, without regard to the figures they represent.

Twopence, threepence, etc., up to elevenpence, count as one word in each case.

Words must be written in full. Abbreviations will not be allowed, except such as are in ordinary use, as Co. for Company, St. for Saint.

**RULE 3.—MESSAGES BEYOND TELEGRAPH LINES.** Messages destined for places beyond the lines of telegraph must contain instructions from the sender as to the places from which they are to be posted. Such instructions must be inserted immediately after the address, and charged for as part of the message. Twenty-five cents, gold, must be charged extra for postage in such cases.

In messages for China the words "Post Galle" or "Post Kiachti;" in messages for Australia, the words "Post Galle," and in messages for Gibraltar, the words "Post San Roque" must be inserted and counted. The Galle route is best for China business.

**RULE 4.—PREPAID REPLIES.** The sender of a message may prepay the reply as follows: The sender must insert immediately after the address, and pay therefor, the words, "Reply, — words, paid." The number of words paid for will be written in the blank space. Should the reply contain more words than the number so specified, the sender of the reply, on presenting it for transmission, must pay for the excess. The reply must be tendered not later than eight days after arrival of original at delivery station.

If answer of only ten (10) words is prepaid, it is sufficient to insert in original message "Reply paid."

In cases where more than one reply is required and prepaid, the sender must state the number of replies, thus: "Three replies, paid;" or, if more than ten words, thus: "Three replies, each — words, paid."

The privilege of prepaying replies provided for by this rule is confined to business with Great Britain and Ireland.

**RULE 5.—REPEATED MESSAGES.** In order to more effectually secure accuracy in transmission, messages may be repeated back from the station at which they have been received to the station from which they were originally sent. Repeated messages are charged double the ordinary rates. The words, "Repetition paid," must be inserted immediately after the address, and charged for.

Should the RECEIVER of an ordinary message require it to be repeated, on account of supposed error, the application for repetition must be addressed to the sending station. Such application and repetition must be treated as two distinct messages, and be prepaid by the applicant. Should an error be discovered, the charges for the application and repetition will be returned.

**RULE 6.—CODE MESSAGES**—by which are meant messages constructed, for purposes of secrecy, of disjointed sentences, or words rendering the meaning unintelligible—will be transmitted with every possible care; but the telegraph companies, while willing to investigate by post complaints respecting errors in such messages, will not return the charges upon them unless they be "repeated messages." (See Rule 5.) Should the RECEIVER of such a message have it repeated, the amount paid for application and reply will not be returned unless the message was originally a "repeated message," and paid for as such by the sender.

**RULE 7.—CRYPTER MESSAGES**—by which are meant messages consisting of letters, grouped or otherwise not forming any known or dictionary words, or of numerals—will be counted each letter or figure as a word. When cypher is intermixed with plain words, the plain part of the message will be charged at ordinary rates, and the remainder as cypher.

**RULE 8.—GOVERNMENT CYPHER MESSAGES** may consist of numerals or letters, or both, and may contain plain dictionary words. They will be counted as follows:

1. Count plain words as single words.
2. Divide the total number of numerals or letters, if not in groups, by five (5), and count each five and fractional remainder as a word. If grouped, count each group of five or less as one word; over five and up to ten, two words, and so on.

These rates are for unrepeat Government cypher messages, and no charges will be returned on account of errors. Double rates must be charged if these messages are requested by the sender to be repeated.

**RULE 9.—PRESS MESSAGES.** The authorized agent of any newspaper, or association of newspapers, may transmit general and political news in plain language, for publication, from New York City, New England and British Provinces to Great Britain and Ireland, at one half the above rates from New York City, viz.: at \$3.75 for ten words or less, and 37½ cents for each word over ten. Places south and west of New York City will collect in addition full cable rates to that point.

**RULE 10.—COMPLAINTS.** All complaints respecting irregularity in transmission or delivery of messages must be made by the sender in writing. In cases of delay or error, the complaint must be accompanied by the receiver's copy of the message. In cases of non-delivery, a statement in writing from the person to whom the message was addressed, to the effect that the message has not been received, must be furnished with the complaint.

Managers are specially instructed that all claims for refunding of tolls on cable messages must be forwarded to the Secretary, at New York, with statement of complaint, as above. The tolls will, in no case, be refunded without instructions from headquarters.

The following notice is appended to the Tariff Sheet of the Anglo-American Telegraph Company (limited):

**NOTICE.**—The public are informed that the Anglo-American Telegraph Company (limited) will not incur or accept any liability whatsoever, either for the due transmission of telegrams to the cable, or for their safe delivery at their destination; nor will they accept any liability arising from delay or stoppage, by reason of any accident to the cable or instruments. The Company will not consent to be liable, under any circumstances, for any sum whatever, as damages or otherwise, for loss resulting from errors, mistakes, delays or other causes, in respect to any message entrusted to them, beyond the return of that portion of the charge accruing to the Company out of the amount received, and then only in case the message should fail in transmission when in the hands of the Anglo-American Telegraph Company (limited).

#### TARIFF TO PLACES BEYOND GREAT BRITAIN, IRELAND AND FRANCE.

On messages to places beyond Great Britain, Ireland and France charge the following rates, in GOLD, in addition to the tariff to Great Britain:

	For 20 words or less, counting address, date & signature.

Austria, and Hungary, . . . . .	1 20
Baden, . . . . .	80
Bavaria, . . . . .	80
Belgium, . . . . .	86
Benghazi, . . . . .	5 20
Channel Islands, . . . . .	1 20
Corfu, . . . . .	1 80
China, Post Galle, including postage, . . . . .	15 10
Denmark, . . . . .	1 30
North Germany, . . . . .	1 10
Greece and Ionian Isles, . . . . .	2 00
Hohenzollern, . . . . .	80
Holland, . . . . .	1 00
India, via Turkey and Kurrachee, . . . . .	11 70
India, stations west of Chittagong, via Turkey and Kurrachee, . . . . .	13 60
India, stations east of Chittagong, via Turkey and Kurrachee, . . . . .	14 60
India, Ceylon, via Turkey and Kurrachee, . . . . .	14 60
India, via Russia, Persia and Kurrachee, . . . . .	12 00
India, stations west of Chittagong, via Russia, Persia and Kurrachee, . . . . .	13 90
India, stations east of Chittagong, via Russia, Persia and Kurrachee, . . . . .	14 90
India, Ceylon, via Russia, Persia and Kurrachee, . . . . .	14 90

Italy, . . . . .	1 20
Luxembourg, . . . . .	70
Malta, . . . . .	1 80
Moldavia, Wallachia, . . . . .	1 40
Norway, . . . . .	1 70
Persia, . . . . .	5 80
Portugal, . . . . .	1 30
Prussia, . . . . .	1 10
Roman States, . . . . .	1 20
Russia in Europe, . . . . .	2 10
Russia Caucasus, . . . . .	2 70
Russia, Siberia, first region, . . . . .	3 70
Russia, Siberia, second region, . . . . .	5 30
Servia, . . . . .	1 40
Sicily, . . . . .	1 20
Spain, . . . . .	1 10
Sweden, . . . . .	1 60
Switzerland, . . . . .	80
Tripoli, . . . . .	3 50
Tunis, . . . . .	1 60
Turkey in Europe, . . . . .	2 00
Turkey in Asia, first region, . . . . .	2 80
Turkey in Asia, second region, . . . . .	3 60
Wurtemberg, . . . . .	80
Alexandria, Egypt, . . . . .	6 80
Cairo and Suez, . . . . .	7 80
Suez Canal Company, . . . . .	9 00

For each ten or fraction of ten words above twenty, charge, in addition, one half of these rates.

#### RULES FOR BUSINESS WITH PLACES BEYOND GREAT BRITAIN AND IRELAND.

(These rules govern the additional charge beyond Great Britain.)

All compound names, including names of Countries, States, &c., and compound words, count for as many words as they contain.

Two pence, three pence, &c., count as two words in each case.

Double rates must be charged for all Government messages written in code or cypher.

The Continental Telegraph Companies will not entertain or investigate complaints of error or delay in unrepeat messages.

In all other respects the rules for business with Great Britain will be observed.

#### ACCOUNTS.

Atlantic Cable Business will not be included in the regular Monthly Account Current and Check Report. Keep an entirely distinct and separate record thereof, and at the end of each month forward promptly to our Auditor, at New York, by express:

**FIRST.**—A detailed statement of SENT BUSINESS, showing date, address and signature of each message, number of words, and amount collected.

**SECOND.**—A detailed statement of RECEIVED BUSINESS, giving same data, omitting amount.

**THIRD.**—The originals of all messages sent, and copies of all messages received.

#### REMITTANCES.

Remit WEEKLY by express, to the Treasurer, New York, the entire amount of gold collected, with written statement giving name of your office, date and amount for each day. Take receipt from express company for amount of each remittance.

#### Tariff and Rules for Cuba Business

FURNISHED BY THE INTERNATIONAL OCEAN TELEGRAPH COMPANY.

#### ALL MESSAGES MUST BE PREPAID.

#### TARIFF IN GOLD TO HAVANA.

	For 20 words or less.	Each additional word.
From any office west of the Mississippi River, . . . . .	\$15 00	\$0 75
From any office in the Provinces of Nova Scotia and New Brunswick, . . . . .	12 00	0 65
From any office in New England, . . . . .	11 00	0 55
From any other office of the Western Union Telegraph Company, . . . . .	10 00	0 50

To places in Cuba other than the City of Havana, as per list below, an additional charge, in gold, must be made as follows :  
For a message of twenty words or less, - - - \$0 75  
For each additional ten words or fraction thereof, - - - 0 25

LIST OF TELEGRAPH STATIONS IN CUBA	
Batabano,	Jiguani,
Bejucal,	Los Palacios.
Bemba,	Los Tunas,
Bocu du Sagua,	Matanzas,
Bayamo,	Pinar del Rio,
Consolacion del Sur,	Paso Real,
Colon,	Puerto Principe,
Cardenas,	Remedios,
Cienfuegos,	San Antonio,
Caibarien,	Santo Domingo (Coloniade),
Ciego de Avila,	Sagua,
Cuba,	Santi Spiritu,
Guanajay,	Trinidad,
Guines,	Union de Reyes,
Guaimaro,	Villaclara.

N. B.—Dispatches to points in Cuba, beyond Havana, are required by the Spanish Government to be written in the Spanish language. No responsibility will be taken on such messages if forwarded in any other language.

RULES FOR CHECKING, COUNTING, ETC.

RULE 1.—CHECK. The check must comprise:  
1. The number of words in the body of the message.  
2. The total number of words, including date, address and signature.  
3. The amount of Tariff.

In telegrams from Cuba, destined for Europe, the word Cuba must be added to the check.

RULE 2.—COUNT.

The date, address, and signature must be counted and charged for.

The name of the place where the message originates must be included in every message, to protect the several companies interested in its delivery. Should it be desired to send a message in which any of the above requirements are omitted, the sender must write below the message, "Responsibility of Delivery Waived," and sign the same name or names as in the signature of the dispatch. The prefix "R" must precede the check upon such messages.

All compound names and words count for as many words as they contain.

Figures and punctuation marks and words count as one word.

RULE 3.—Official Messages of the Spanish or United States Government will be charged less than the above rates by \$3.50 for each message of twenty words or less, and eighteen (18) cents for each additional word. All such messages must be signed officially, and the prefix "G" must precede the check.

RULE 4.—Code, cypher, and abbreviations are disallowed by the Spanish Government.

RULE 5.—POSTAGE. Messages to be mailed to West Indian and Gulf Ports, and South America, require prepayment of postage, twenty (20) cents in gold.

ACCOUNTS AND REMITTANCES.

Keep an entirely distinct and separate record of Cuba Business, and forward to the Auditor, New York, by express, at the end of each month:

FIRST.—A detailed statement of SENT BUSINESS, showing date, address, and signature of each message, TOTAL NUMBER of words, number of BODY words, and amount collected.

SECOND.—A detailed statement of RECEIVED BUSINESS, giving same data, omitting amount.

THIRD.—The originals of all messages sent, and copies of all messages received.

Remit weekly by express, to the Treasurer, New York, as per rule for remittances upon Atlantic Cable Business.

WILLIAM ORTON,  
President.

TARIFF BUREAU.

Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,

Natick, Mass., }  
Frammingham, Mass., } 25c. more than Boston, Mass.  
Wellesley, Mass., }  
Needham, Mass., }

Hereafter the rate to Catasqua, Pa., will be 25c. more than special rate to Philadelphia.

GENERAL INFORMATION.  
The name of the office formerly known as Quincy, Madison Co., Ind., has been changed to Ellwood, Ind.

The New Tariff System.  
The books of the new tariff system are now in course of distribution, and offices not supplied within a few days after receipt of this number of the JOURNAL will immediately inform the Tariff Bureau by telegraph.  
THE NEW SYSTEM WILL TAKE EFFECT ON THE FIRST DAY OF OCTOBER.  
The local rates, i. e., rates to points within a circle of 75 miles of each office, have been entered in a considerable number of the books sent out, and as soon as possible lists will be forwarded to

offices whose books are not complete in this particular. In the meantime offices will collect as follows :  
Those having books marked District B, C, D, E, F, G or H, will charge 25c. to all points within 25 miles, 30c. for all within 50 miles, and 35c. for all within 75 miles.  
Those having books marked District I, K, L, M or O will charge 35c. for all offices within 25 miles, 45c. for all within 50 miles, and 55c. for all within 75 miles. These distances will be measured in an air line from each office.  
Whenever the present rates are less than the local rates and rates by square, you will continue to charge present rate, but at once report to the Tariff Bureau, giving clearly and in detail the names of places and the rates thereto.  
The names of new offices, which may be opened hereafter, and announced through the JOURNAL, should be written in the book in ink, but the tariffs must be in all cases entered in PENCIL.  
The following lists of offices and corrections must be plainly entered in the book in their proper positions. If not carefully attended to great confusion will result, and our efforts to reform the tariff system of the company rendered in a measure fruitless.

TO BE ENTERED IN PART I.	
260 Allegan, Mich.	389 Jonesburg, Mo.
* Allegheny, Va.	103 Jordan's W. S. Sp'gs, Va.
143 Allegheny Springs, Va.	* Kinderhook, N. Y.
446 Amazonia, Mo.	65 Killawog, N. Y.
* Archer, Wy.	292 Kingston Springs, Tenn.
* Arichat, C. B.	370 Knob Lick, Mo.
* Aspen, Utah.	59 Lamokin, Pa.
* Aspy Bay, C. B.	408 La Plata, Mo.
336 Atkinson, Ill.	60 Laurel, Del.
445 Avoca, Iowa.	* Leicester, Mass.
* Bay de Lievre, N. F.	240 Leslie, Mich.
* Bay du Nord, N. F.	* Lingan, C. B.

Kinderhook, N. Y.	15 1	Valatie, N. Y.
Mahanoy Station, Pa.	45 4	Danville, Pa.
Middleburg, Md.	40 3	Baltimore, Md.
Millville, Pa.		
Tarif from offices having books of Districts A, B, C, D, E or F, same as Mast Hope, from all others, same as Shohola, Pa.		
Ranagh Gap, Pa.	35 3	Philadelphia.
Rock Haven, Ky.	50 5	Louisville, Ky.
Schuyler, Neb.	90 6	Omaha.
Somerville, Me.	35 3	Ellsworth, Me.
So. W. Harbor, Mt. Desert, Me.	40 3	Ellsworth, Me.
Valley, Neb.	60 4	Omaha, Neb.
Washington & Corners, N. Y.	30 2	Fishkill, N. Y.
Weber, Utah	45 3	Ogden, Utah.

WILLIAM ORTON, President.

[We think it only fair that the Podunk office should have a chance at publicity as well as Chicago, and therefore make room for the manager's description of it :

PODUNK, Iowa, August 12, 1869.

EDITOR JOURNAL OF THE TELEGRAPH :

Seeing that you devote considerable space to description of important new offices, I send you herewith a compendium of improvements in the office here.

Podunk, Iowa, office having been recently refitted with modern Western improvements, stands "to the fore" among offices of its class. The receiving room is on the first floor, literally the ground floor, separated from the operating room by a substantial counter, profusely carved, it having been formerly a butcher's block. The walls of this room are grained by Nature & Co., one of the oldest and most experienced artist firms in the West, thus dispensing with the vulgarity of lath and plaster. The ceiling is hung with finely woven festoons of silken fibre, so placed as to obviate the necessity of fly-traps, each festoon being kept in repair by the boss weaver thereof, specially detailed for the service. A self-acting sprinkler in the roof, operates profusely during a shower, thus laying all dust and imparting a pleasing humidity to the air. The instrument table and chair are rare specimens of antiquated deal curiously wrought with devices of gal-lows, and inscribed with initials and numerous boot-heel marks. All the instruments have been thoroughly tested, having been in use for twenty-three years in other offices. I subjoin the list of the working force of the office :

Manager—J. H. Scrooge.  
 Chief Operator—John H. Scrooge.  
 Assistant—J. Henry Scrooge.  
 Messenger—John Henry Scrooge.  
 Receiver and Bookkeeper—Mr. Scrooge.

Very respectfully, J. H. SCROOGE.

## STICKWELL & CO.'S

EXTRA MUOILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUOILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, SOZ. CONE, SOZ. FLAT, SOZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUOILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. B. STAFFORD,  
Sole Proprietor.

## THE STANDARD AMERICAN WORK ON THE TELEGRAPH MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUZE, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SARKIS.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—The Telegraph.

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—London Mechanic Magazine.

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—Journal of the Telegraph.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS, PUBLISHERS, 28, 30, 32 Centre Street.

## DURANT'S

NONPAREIL RELAY.

A PRACTICAL

SELF-ADJUSTER

ON ALL ORDINARY CIRCUITS.

Price, \$30.

Mr. GEORGE E. SKIBERT, Western Union operator, 145 Broadway, says :

"I have worked Durant's Self-adjuster on the Cincinnati wire for two days, and can testify to its being a Self-adjuster in every respect."

For a full description of the construction and advantages of this instrument see Journal of the Telegraph of December 15, 1868.

Goods sent to all parts of the Continent with bill C. O. D.

Parties remitting in advance by certified check, payable in New York, or by Post Office Order, will save the expense of returning funds by express.

Address all orders to

CHARLES DURANT,

Office and Factory, 36 Nassau Street,

NEW YORK CITY.

Agent for the sale of the Nonpareil Relay on the Pacific Coast,

Mr. STEPHEN D. FIELD,

San Francisco, Cal.

# Journal of the Telegraph.

## Darker Yet.

EDITOR JOURNAL OF THE TELEGRAPH:

The article in the last issue of the JOURNAL OF THE TELEGRAPH headed "The Dark Side," is one well worthy of every telegrapher's perusal and consideration. It is one I have long been anxious to see brought before the public eye. To the suggestions given there every man should say amen.

When we think of the amount of evil existing among those employed in the telegraph corps, it causes deep anxiety and regret. The profession is one that requires that none but sober and honest men should be intrusted with its duties, for its responsibilities are of such a nature that the public can not have implicit confidence in it if its employees are loose in their habits or defective in character. I am sorry to believe that the larger proportion at present employed are more or less intemperate.

Why is it that so many of this class are employed in our large cities and best places, when so many true and responsible men are idle and out of employment? I am glad this subject has been presented for our investigation and hope it will not end here. The time has been, and is not much better now, when one was ashamed to own that he was a telegrapher. The profession seemed to be in the hands of dissolute men. The public marked the craft accordingly. Society pointed at us as unworthy. For illustration, visit some of our larger places and examine the class employed there. Of whom do they consist? As a general thing they are those who pass their leisure hours in debauchery and who never have a cent in their pockets to pay their honest debts. To be sure this does not apply to all, but the report shows a fair sample. In this report we find four-fifths are dismissed for drunkenness. If all who drink were dismissed, how many of the present incumbents, suppose you, would be retained?

This is not all, a worse feature presents itself. The honest, steady and industrious man applies for employment, "and although he may have the best of recommendations," he finds there is none for him, and why? because the country is so flooded with "dead beats" that our superintendents can't have implicit confidence in the profession, so the honest man is placed upon the same footing with the rogue; hence you see the evil not only exists in one, but in various forms. I say let us have total abstinence. I am willing to submit to its law and would be glad to see its adoption in the whole telegraphic system.

Fraternally yours, **MANAGER.**

[The above comes from the manager of an office in Illinois, who desires the date suppressed. There was a time when, in certain regions, it was really true that to be an operator was tantamount to an admission of connection with an evil crew. This was the result of bad lines, uncertain pay, general demoralization. We can scarcely believe that this still exists to any important extent. We should be glad to see every hanger on of barrooms, every associate of blacklegs, every moulder of obscene language, or of oaths, hustled from the business. We do not think there are many such. There are some, more than we like.

Now, as to total abstinence, let some one who wants to do a good thing start a genuine teetotal association. It is possible to commence a movement which may eventually make it impossible for a drinking man to find employment in a telegraph office].

## The Temperature of Sea-water at Great Depths.

Several carefully conducted soundings made near the Faroe Islands, have revealed the fact that while the surface water has an almost invariable temperature of 52°, the heat at great depths varies exceedingly. At a depth of 500 fathoms the temperature was 32°—a fact which is explained by the supposition of a cold Arctic stream flowing from the northeast and apparently coming between the fork of the Gulf Stream. Another interesting fact established by these inquiries is, that even at a temperature in the ocean almost that of our freezing point, there are an abundance and variety of animal forms which could not have been predicated. —*Medical Times and Gazette.*

## SPECIAL NOTICE

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLES

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

J. D. REID, Treasurer.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**CHESTER, PATRICK & CO.,**

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS.

SOUNDERS,

SWITCHES.

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Mosaic Batteries (Induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

ALANSON CARY, Treasurer,

No. 234 West 30th street,

New York.

Or Agents of the Company.

**L. G. TILLOTSON & CO.,**

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET, PHILADELPHIA.

The guarantees of this insulator are:

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

WHOLE NO. 45.

## The Money Bill for the Telegraphs.

(From the London Economist.)

The financial aspect of the scheme for purchasing the telegraphs is now very different from that originally presented. Almost every feature of the project has been changed, occasionally with the effect of making it more attractive, but usually with the opposite result. First of all, the expense of acquiring the telegraphs is to be more than doubled. Mr. Scudamore originally calculated that 2,400,000*l* would suffice. By a subsequent revised estimate he allowed the sum of 3,000,000*l*. The Government now say 6,715,000*l* as the foreseen expenditure, and 6,750,000*l* to cover everything; and they are asking 7,000,000*l* to make sure. Of course there is a corresponding difference in the annual interest on the capital to be sunk. Mr. Scudamore reckoned on a sum of 100,000*l* only, but the estimate now is 236,000*l*. The gross receipts again have not increased in proportion. Mr. Scudamore calculated on 640,000*l* and the estimate now is 673,000*l*—an increase of only 33,000*l*. And the changes here are the more vital, as the incidental receipts for wayleaves, foreign messages, and similar sources are more, and it is the anticipation of inland messages which it has been thought proper to moderate. The most striking change of the original sketch tending to make it more popular is the estimate of expenditure. The working expenses were reckoned a twelvemonth since at 405,000*l*, but the figure now is only 359,000*l*, or 56,000*l* less. In this way it happens that the original surplus of 135,000*l*, instead of being abolished altogether by an addition of 136,000*l* per annum to the annual interest on the capital, is only reduced to 77,000*l*. The following is a tabular comparison of the two estimates:

	Mr. Scudamore's Proposal.	As now Proposed.
	£	£
Capital for purchase and plant..	3,100,000	6,750,000
Annual interest on ditto .....	100,000	236,000
Gross revenue.....	640,000	673,000
Working expenses.....	405,000	359,000
Surplus.....	135,000	77,000

Considerable as the differences are, they are such as might have been reasonably expected to occur. The country may congratulate itself if it does not start the business at a loss, and no one is urging the scheme very seriously thought of the profit to be derived. Everything, as first presented, was necessarily in the rough. Still the changes in a great degree have arisen from changes in the scheme itself, or from the lapse of time since the first reports were drawn up. As to the latter point the statement of the Marquis of Hartington in his speech, though made for a different purpose, is important. The trade of the two principal companies—the Electric and International, and the Magnetic—was found to be growing in the one case at 18 per cent., and in the other case at 32 per cent. per annum. Clearly every year of such increase was likely to make a material difference in the price reckoned at so many years' purchase of the present profits. The changes in the scheme again have included a resolution to buy up the entire monopoly of every company, and make arrangements with the railways. The property

acquired is larger and more productive than the limited property first thought of. As to the other changes, the principal one—viz., the reduction of the estimate of gross revenue—appears to have arisen from a mere wish to err on the safe side. The main difference, as we have said, is in the calculation for inland messages. It was originally thought that the new regime would give us 11,000,000 messages to start with, but the Marquis of Hartington only reckons on 8,815,000, a diminution of upwards of 2,000,000, or nearly a fifth. If the original estimate had been allowed to stand, the surplus would have been even more than before, the additional business acquired yielding large incidental receipts. Regarding the decrease of expenditure, the explanation is that while before we had a mere sketch estimate, not too low for safety's sake, it is now possible to say with some certainty what the expense will be.

The following are the figures for the first year, as now presented :

REVENUE.	£	EXPENDITURE.	£
Inland messages.....	514,000	Maintenance of land wires.....	89,000
Continental messages, &c.....	109,000	Do of inter-insular cables.....	2,000
Private wires.....	5,000	Do of instruments... ..	11,000
News.....	25,000	Salaries and wages....	192,000
		Wayleaves.....	49,000
		Renewal of cables... ..	16,000
			359,000
		Interest.....	237,000
		Surplus.....	77,000
	673,000		673,000

## A Curious Letter.

At a meeting of the Polytechnic Association of the American Institute, a few days ago, the chairman exhibited a letter which was certainly a curiosity. The letter and envelope were made of sheet iron, and yet weighed less than the regular letter rate, one half ounce. The envelope measures four and seven-eighths by two and three-fourths inches, and the letter is eight by five inches. Careful measurement with a micrometer gave one five hundredth of an inch as the thickness of the sheet. Letters have been written on sheet iron before, and an iron book of three hundred pages which measured less than one inch in thickness was shown at the World's Fair. The book was printed with elastic type, made especially for the purpose.

## Automatic Fire Lighter and Alarm.

John Rigby, Fort Howard, Wis.—This invention consists in an arrangement of a rotary disk to be operated by a spring, and held in check by a catch, to be disconnected by a weight, let fall by the action of the hour hand of a clock, for allowing the spring to operate the disk when required, which rotary disk carries a piece of sand paper to scrape a match, the end of which is held against the scraper. This match is so arranged as to light a wick saturated with oil, and arranged to give a sufficient flame and to burn long enough to waken persons sleeping in the room.

The Dutch are arranging direct telegraphic connection with Hong Hong.

## The Telegraph and the Press.

BOTH SHOULD BE FREE.

MEMPHIS, Tenn., August 23, 1869.

To Col. JAMES COLEMAN, Superintendent Western Union Telegraph Company—

My Dear Sir :—Your long connection with the telegraph interest in this State and city singles you out as the person proper to be addressed touching the very important question of the postal telegraph, which was suddenly sprung upon the country by Mr. Elihu B. Washburne, of Illinois, at the last session of Congress. As builder, operator, proprietor, manager and superintendent, your experience runs over a term of twenty years in Tennessee, and of nearly that period in our city. You have enjoyed the uninterrupted confidence of our business community during that time.

Intimately associated with the telegraph—with its objects, its destiny and its history—is the press. Though not of contemporaneous origin, the one being but in its infancy, though grown to be a gigantic power, and the other claiming a history of several centuries, these great estates are, in their nature, their mission, and their influence, wedded together by the strongest bonds that can unite two separate and distinct interests. They have a common object in that they are equally employed in the circulation, distribution and transmission of intelligence, truth and knowledge over the civilized world. The methods are different, but each is equally necessary to the dissemination of intelligence. The telegraph reports the transactions of the hour, and transmits it in an instant of time from one continent to another, from State to State, from city to city, while the press, through its million mouths, circulates it widely to every door, to every inmate of every home. Thus you perceive that the telegraph without the press would be shorn of its highest capacity, and that the press, without the telegraph, would be deprived of the vital function of enlightening its million readers regarding the transactions of the world. In the other case the telegraph would lose its right arm and chief interpreter to the various peoples of the earth. A free press is indispensable to liberty. Without it a republic would be but a name. A destruction of its freedom would be like a permanent eclipse of the sun, or like poisoning the atmosphere. The framers of our Constitutions, both State and Federal, provided stronger and more effectual safeguards for the continuance of its freedom, than for any other object. It was justly deemed by them as the last and most secure intrenchment of the spirit of freedom.

When in days of "Auld Lang Syne" you were engaged, with others, in erecting telegraph lines, with your own hands, did it ever occur to you that Government, grown powerful by a long course of war discipline, would coolly moot the proposition to take possession of the work of your hands, or else render it valueless to its proprietors by building separate lines, which would virtually be a complete monopoly? I find many intelligent persons who believe the Government ought to own and work the telegraph, because they have been absurdly enough stuffed with the idea that

the tariff would be lower under general Government regulation. I shall come to that point after awhile, and shall show how unsupported is that opinion by facts. At present I wish to deal with the more important question arising from the effort to create a postal telegraph; whether opinion can be free and uncorrupted; whether the press can enjoy its constitutional immunity; whether the State can be a free Republic under the telegraph postal system proposed by Mr. Washburne. Give the Government a complete system of telegraph lines, penetrating all the States and Territories, and there cannot be a doubt that it will banish all competition.

A Government of vast resources and unlimited powers of taxation can afford to lose, in order to drive competition from the field. It can enact laws, too, which will restrict and hamper opposing lines. Its policy will be adverse to competition, because, as all such enterprises are moneyed by governments with large swarms of worthless partisans to reward, will entail the necessity of drawing largely from the public treasury to support the monopoly. We assume under this state of facts therefore, that, it being the policy of the Government to create a monopoly, and having the power to do so, will, sooner or later, bring about that result, whenever it shall own its independent lines.

Looking out from this stand-point what must we necessarily behold? The vast and ramified interests of telegraphing, including dispatches, managed by a party, and that party the one which has possession of the central government. A few years ago such a prospect would have startled and alarmed the boldest among us. And there are those here ready to vindicate such a usurpation and prostitution of power, upon the plea that the Government could give us cheaper dispatches. They would be the first to cry out against such an idea if the Government were to undertake to run cotton plantations on the pretext that it could grow cheaper cotton, or to do the carrying trade, because it could furnish cheaper freight. The plea is insufficient even if true. The party that manages the Government would act with a disinterestedness which no party has ever been known to exhibit if it did not use its newly acquired and all-powerful patronage to advance its interests and perpetuate its existence. Let us consider what this patronage would amount to and how it might be, and would be abused. From Washington city, the central center of political management, to any part of the Union, a fact or a falsehood advantageous to the incumbents, a threat, a command, an opinion, an innuendo, could be flashed, in an instant, on the eve of an important election, which might turn back the tide of popular rising and hold in bondage a nation. It may be said that their opponents would be allowed the same use of the telegraph as themselves. Did ever an interested party deal thus fairly with opponents? Take the post office. When has been the time that the post office would not hurry forward the dispatches, documents and letters of the reigning party, in advance of those sent by the opposition? And yet the post office is an imbecile in conveying intelligence compared to the telegraph.

It may be further alleged in support of Mr. Washburne's proposition, that the laws can restrain the officers and employees from excluding their opponents from a participation in the benefits of the telegraph. But the objector fails to consider that those who make the laws will manage and manipulate the telegraph, and that they will do it to suit themselves. Now, give a party the absolute moulding of its own constituents, of its franchise laws and its suffrages, and it would seem it might fondly exclaim *esto perpetua*. But I do maintain, and I believe with sound reason, that if you endow the same party with the absolute control of the telegraph lines throughout the Union, its lease of

power will be firmer and more fixed, and that it may boast that it has erected a foundation for its existence more durable than brass.

A constituency thinks—has a conscience—and though warped temporarily by prejudice and passion, may be brought finally to right reason. However ingeniously it may be created it will abandon its patrons when interest lies in the opposite direction, or when awakened to the fact that the great interests of the country, in which each individual is interested, are being sacrificed. Now, this awakening may and does occur through the powerful instrumentality of a free press, reinforced by a free telegraph. But let this free press be emasculated by subsidizing its chief strength, the telegraph, and let a free telegraph be surrendered into the hands of a free governing party, and you have lost the arm of defense against corruption and tyranny, and the instrumentality by which the people are to be aroused to a sense of public abuses, wrongs and corruption, and are to be brought to vindicate and right themselves. A telegraph in the hands of an able plotter, would prove to be a spy into every man's actions, and could spread throughout the country a terrorism which would subdue the masses to its will. Such a desecration of the offices and discoveries of the illustrious philosopher of Pennsylvania should never be tolerated by a people who are now enjoying the blessings of his initial discovery, perfected by the mind of Morse, cheapened and utilized by joint stock associations, open to free competition, and in the hands of the people themselves.

I shall hereafter endeavor to point out how this free competition of rival telegraph interest has culminated in the most prosperous, cheap, prompt and reliable system of telegraphing in the world, or as it now exists on this continent.

Very truly yours,

LEON TROUSDALE.

On the 20th of June last Albert Wyeth, telegraph operator, was tried by drumhead court martial at Santiago de Cuba, sentenced to death, and seven hours thereafter executed. In what spirit he met his fate will appear from the following letter:

#### LAST WORDS.

SANTIAGO DE CUBA, June 21, 1861.

I have been sentenced to die at seven o'clock this morning. It is now about two o'clock. I will be shot. I have just received the holy baptism in the Catholic Church. The priests are very kind to me, and I, with five others—four of whom were companions of mine on the vessel—will pass the night here in the chapel. This city is generally called Cuba, but the proper title is as above.

Remember the day, the 21st of June.

I have little time to write, but the American Consul will, I hope, give my family all the information he can by letter. I will die bravely—without a tremor. I do not fear death at all. My only regret is the pain and distress it will give my mother and father and my beloved sisters and brothers, as well as all my dear ones. Mother, remember you have some children in heaven, and you and father will soon be there, and then we will see each other again. This life is so full of vicissitudes that, although God has ever been more than ordinarily kind to me on earth, I embrace eternity with infinite joy. Oh, be comforted through Jesus Christ, our Lord. Think of the blessed change that I told you had lately come over me in New York, and how happy I am now in the assurance of God's merciful goodness. I die happily, joyfully. Be comforted. We will meet each other soon. Oh, glorious philosophy of Christ's religion! What delights it gives promise of!

To father, dear, dear father, to Mary and Lucy, Lou and John, Gertie, her husband and their children, my love—my eternal love. And to my dear aunts and cousins, cousin James and his children, and, in fine (pardon the necessary brevity), to all my dearly loved ones, good-by for a little while, and everlasting love. If you knew how happy I am in the prospect of heaven you would rejoice and be comforted. Let us prepare to meet in God's bosom. A thousand last kisses and good-by—good-by! I am full of thoughts of you all. Your loving, happy son,

ALBERT.

#### An Acknowledgement.

In connection with the recent observations of the eclipse of the sun, Prof. Hough, of the Albany Dudley Observatory, applied for the use of the wires of the Western Union Telegraph company to establish correct time between the point of observation at Mattoon, Illinois, and the observatory at Albany. The following is Prof. Hough's acknowledgement of the service rendered him:

To Mr. Orton, the President, and Gen. Anson Stager, Superintendent of the Western Union Telegraph Company, we are especially under obligations for putting a continuous line of telegraph wire of nearly one thousand miles in length at our disposal, for the purpose of securing time from the Dudley Observatory. Our thanks are also due to the managers of the following offices, all of whom were interested in the success of the work: Mr. C. S. Jones, manager of the Albany office; Messrs. Hucker and Slacer, Buffalo; Messrs. Wright and Tindall, Cleveland; Messrs. Armstrong and Warren, Cincinnati; Mr. J. F. Wallack, Indianapolis; Mr. Pattee, of Mattoon. The necessary connections at the Dudley Observatory were made by Mr. Thos. E. McClure and Mr. H. L. Foreman.

A continuous circuit was secured on the nights of the 5th and 7th, when the Dudley Observatory sidereal and mean time clocks were compared with the clock and chronometer at Mattoon.

#### Forwarded Messages.

OTTUMWA, Iowa, Sept. 2, 1860.

EDITOR JOURNAL OF THE TELEGRAPH:

Please answer this question, about which managers in this vicinity disagree.

A message is received by our line to a party here, who has left before arrival of message, but wishes it forwarded to him. In forwarding, shall I charge number of words in check, counting in the words "Forwarded from," date, &c.? Or leave check same as received? There is nothing in our instruction book to meet a case of this kind.

Very truly, OFFICE MANAGER.

Ans. If to an office of this line, preserve the same check as to words, and charge as a new message. If to pass over another line, simple delivery to that line is all that duty requires of you.

#### Pope's Modern Practice.

The following is from one of our most valued correspondents to whom we presented a copy of Pope's manual, and who himself is a highly educated engineer and unusually familiar with matters electric:

TIDIOUPE, Penn., 1860.

EDITOR JOURNAL OF THE TELEGRAPH:

Please accept my thanks for the copy of Pope's Modern Telegraphy you were so kind as to send me. Mr. Pope has happily produced, what has so long been so sorely needed by young American operators, a book about the Morse telegraph at once practical and practicable to the greenest and stupidest. It comes amid a dreadful dearth of practical telegraphic teaching, as refreshingly as rain in sultry August.

I regret that he did not abridge his article on resistance measurement and place it in the appendix along with the admirable description of the Atlantic cable apparatus. The space so gained would have enabled him to have discussed, more at length, the care of batteries, which, I think, he too much ignores.

I rejoice and congratulate you on the success of the JOURNAL, which grows better and better with each issue.

Respectfully,

WM. T. SCHNEIDER,  
Civil Engineer.

**A New Atlantic Telegraph.****CONCESSION FOR A LINE BETWEEN GERMANY AND THE UNITED STATES.**

A concession for laying a new Atlantic Cable between Germany and this country has been granted by Count Bismarck, the Chancellor of the North German Bund, to Count Oscar Reichenbach, Dr. Adolph Lasard, both of Berlin; James Lyster O'Beirne, M. P., and J. George Cook, of London. It is dated March 12, 1869, and provides for the laying of a submarine cable between Northern Germany and the United States, the landing of that cable at a suitable point of the North German coast on the North Sea, and the construction of all appliances required for working the cable, with a telegraph station to be erected near the landing place, and is subject to the following stipulations:

The Chancellor of the North German Bund reserves to himself the right of selecting the spot at which the cable is to be landed and connected with the telegraph lines of Northern Germany. He will undertake the care of guarding against the cable being maliciously injured or damaged by vessels. The incorporators may lay the cable direct, and without touching any other territory, or eventually, via England and Newfoundland, to any point between New York and Boston. They also have the option of either laying a new cable, or, in order to establish the connection, of buying any submarine cables already existing. In the latter case the Chancellor is to have the right, before the purchase of the cable, to cause the same to be examined as to its working capacity, as well as the dangers it may be exposed to, and to prohibit, when found necessary, its being purchased. The incorporators are permitted to form connection with the Indo-European Telegraph Company for the interchange of telegrams between America and Asia or Australia.

The Chancellor of the North German Bund will issue the regulations regarding the transmittance and exchange of cable telegrams. Telegraph officials of the Bund will be employed at the landing station, in order to deliver the telegrams coming from the interior to the officers of the corporators, and to transmit the telegrams received over the cable to their addresses. For the connection with the telegraph lines of the interior, and especially for direct lines to Hamburg, Bremen and Berlin, the North German Bund will make arrangements. Respecting telegrams from India via England to America, the incorporators are to come to an understanding with the Indo-European Company. The telegraphic communication is subject to the rules laid down by the International Telegraph Convention at Vienna (July 21, 1868), and to any further alterations through international conventions; for the transmittance of telegrams over this cable, however, no higher charges shall be made than those made on any other transatlantic cable. Government dispatches from the Presidency of the North German Bund shall have preference over other dispatches.

The cable is to be constructed in the best known manner, and its manufacture is to be commenced within six months after the date of the concession, and the whole line to be completed within two years after that date. If required by an increase of traffic, or if the cable should get out of working order, a new cable is to be laid within eighteen months after the Chancellor of the Bund shall have so directed. An interruption of two years in working the cable shall cause the concession to become null and void. The incorporators shall make a deposit of \$100,000, and within six months thereafter shall show subscriptions for the cable to the amount of 9,000,000 thalers, which capital stock may be raised to 12,000,000 thalers. The value of cables already laid and purchased from other companies may be deducted from that amount. The concession expires after the lapse of twenty-five years,

unless a new agreement shall have been entered into as regards the same. Any difference of opinion between the Chancellor of the North German Bund and the incorporators shall be decided by the arbitrament of three judges, to be nominated for that purpose from the Prussian Supreme Court.

**Why they Die so Fast.**

NEW YORK, August 25th, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

The question has been asked, "Why do they die so fast?" and I think I can give an answer. One great cause is that operators as a general thing are too much cramped at their work, sitting as they do in a low chair and leaning over a desk but very little higher, they grow round shouldered, narrow chested; and if they drink liquor, smoke or chew tobacco, but little more is needed to settle them.

The one great remedy for this is exercise, in the open air or at the gymnasium. I have wondered why the clerks and operators have not started such an institution. I am sure they would if they only knew what great advantages they would derive from it, especially those who are weak and delicate. I speak from experience. Six months' trial of the gymnasium would make all the boys square shouldered and muscular, better base ball players and healthier looking altogether.

Then we would have fewer assessments to pay and the telegraph paper fewer obituary articles.

FROM A SQUARE SHOULDERED OPERATOR.

**Phosphorescent Rats.**

It is reported that a Nashville (Tenn.) druggist has invented a rat paint made of a preparation of phosphorus. He first catches a rat and paints him. After dark he (the rat, not the druggist) looks like a ball of fire, and, going among his fellow rats, they become frightened and vacate the premises, the phosphorescent rat following of course and hurrying up the rear. This report needs to be *rat-ified*.

**Don't Be Extravagant.**

If the poor house has any terrors for you never buy what you don't need. Before you pay three cents for a jewsharp, my boy, ascertain whether you don't make just as unpleasant a noise by whistling, for which nature furnishes the machinery. And before you pay seventy-five dollars for a coat, young man, find out whether your lady love would not be just as glad to see you in one that would cost half the money. If she would not, let her crack her own hazel-nuts and buy her own clothes.

When you see a man spending two or three dollars a week foolishly, the chances are five to one he'll live long enough to know how many cents there are in a dollar, and if he don't he's pretty sure to bequeath that privilege to his widow. When a man asks you to buy that for which you have no use, no matter how cheap it is, don't say yes until you are sure some one else wants it in advance. Money burns in some folks' pockets, and makes such a big hole that everything that is put in drops through, past finding.

THERE is nothing beautiful and good that dies and is forgotten. An infant, a prattling child lying in its cradle, will live in the thoughts of those who loved it, play its part though its body is burned to ashes, or drowned in the deepest sea. There is not an angel added to the hosts of Heaven but does its blessed work on earth in these that love it here. Dead! Oh, if the good creatures could be traced to their graves, how beautiful would even death appear, or how much charity, mercy, purified affection would be seen to have growth in dusty graves.

**Scintillations from Scientific Authors.**

BY MADISON BUELL.

Faraday froze mercury by means of solid carbonic acid.

If a wire be compressed, heat is developed, if stretched, cold is developed.

All substances possess, in a greater or less degree, the power of storing up heat.

The discovery of the usefulness of glass as a means of producing electricity, appears to have been made by Hawksbee in 1709.

Prof. Faraday employed bismuth for studying certain parts of electrical phenomena that would have escaped observation with less sensible substances.

M. Nobili conceived the ingenious idea of neutralizing the directive force of terrestrial magnetism, in a galvanometer, and invented what is called the astatic needle.

A needle is held in the magnetic meridian by the magnetic force of the earth. Hence, to move a single needle, the current must overcome the magnetic force of the earth.

The removal, for a single summer night, of the aqueous vapor from the atmosphere which covers England, would be attended by the destruction of every plant which a freezing temperature could kill.

Wheeler discovered that bodies in which electricity could be excited would not conduct, hence glass is named as a non-conductor or insulator. Glass, however, becomes a conductor when heated to redness.

A disturbance in the equilibrium of the natural forces, no matter how infinitesimal, is felt throughout the whole world. A wind can not blow in any direction without an equal displacement of air in an opposite direction.

We can not classify bodies into bodies of which some conduct electricity perfectly well under all circumstances, and of which others never conduct it in any case; in other terms, into perfect conductors and perfect insulators.

The terrestrial globe can not be considered as being in its nature as perfect a conductor as a metal, but its bad conductivity is more than compensated by the immensity of its section. We may therefore consider the earth as presenting a null resistance to conductivity.

The double transmission system although extremely ingenious, presents some practical objections. There exists a real inconvenience in interrupting the transmission of a despatch, in order to demand an explanation or to come at an error, since the interruption can not be simultaneous on both ends.

Dr. Maggi of Verona, proved that a circular plate of very homogeneous soft iron conducts heat with more facility in one direction than in the other, when it is magnetized by a powerful electro-magnet; whilst, when it is in the natural state, its conductivity is the same in all directions—perfectly uniform.

THE Great Eastern's rudder, formerly worked by twelve men, now answers the bidding of steam machinery. A single helmsman turns a wheel, and may indulge himself with the pleasing idea that he thereby steers the ship. All that he does, however, is to act upon certain valves, and to set in motion the power by which, in reality, the vast hull is guided through the sea.

## Health of Telegraphers.

BY J. E. O'BRIEN, M. D.

The statistics of a prominent religious denomination show that from a third to one-half their clergy die of consumption. A catalogue de mort of telegraphers would probably exhibit figures as startling.

The fact is now generally known that consumption is primarily a disease of the blood. The vital process by which it is formed out of food being at fault and furnishing a fluid which has more water and albumen, and less corpuscles and less alkalinity than normal. The pulmonic affection is only one of the manifestations of this disease, weak lungs furnishing a favorable point for the deposit of tubercles brought to them by the blood, which seemingly attempts thus to purge itself of the morbid matter.

A glance at the sanitary condition of telegraphers will show us abundant causes operating to impair digestion and to favor imperfect sanguification, while the blood thus imperfectly formed finds in them the other condition required for the disease, viz.: Lungs weakened by compression and the inhalation of a vitiated atmosphere.

Perhaps over work of the brain may be set down as the first and greatest of these causes. It is also unfortunately the one you can least control.

The reason why over work injures digestion and assimilation is curious but simple. Nerve force is used up too rapidly in the brain, leaving none to preside over the working of the arteries, none to stimulate the organs of digestion, and none to be present in the molecular changes of the body and of the blood. This drain of nerve force requires and has an undue supply of blood in the brain, leaving too little for the nourishment of other organs of the nervous system.

Confinement comes next in order as a cause of disease of telegraphers, and it is a fruitful one. Managers are very much to blame for not attending to the proper ventilation and heat of their offices in winter. The only rule used to be, and we presume still is, that the room should be heated to suit the operator who liked it hottest, and we believe that ventilation, too, is pretty generally neglected.

These causes of disease are to a considerable extent properly referred to the nature of your occupation. But, do telegraphers combat the unfavorable circumstances which surround them, by a strict diet, a correct hygiene, and any attempt at exercise? Do they not on the contrary invite the attack of disease by furnishing excitants which are alone necessary to put in operation the predisposing causes, over work, confinement *et alia*? Quite a large proportion of operators looking at their unhealthful surroundings see in them difficulties which cannot apparently be overcome, and unconsciously they yield to these difficulties and add to them until with over worked brain, feeble stomach and diseased lungs, life is dragged along, a weary burden, and men who have opportunities of being and who are as a class the most intelligent of any workers in America, plod on unfelt and unknown for lack of energy.

Is this sad state of depression inevitable? Is there nothing that can be done by telegraphers themselves to improve it?

There is much. In the first place husband and support your strength. You know well enough how to do it. Sleep enough, eat proper food, take exercise every day. Wash yourself. If, however, you should wish to resist nature and assist disease, there is one simple rule that will answer all practical purposes as far as your ultimate fate is concerned. It is to lock up your bowels for days at a time; by doing this you will be not only nursing future disease, but will also facilitate present comfort by adding to the imperfectly oxidized

blood that crowds your brain, morbid matter which should have been eliminated by the bowels, giving to your head additional throb and ache as you bend over your untiring relay.

A great many, if not a majority of telegraphers make their work much harder than they might. Will any telegrapher fail to know what is meant by "an easy worker?" Every one has seen a few specimens of that *rara avis*. Many have wondered at them, concluded it was talent, and failed to imitate. Every good operator should be an easy worker, but he will always fail to be one who wastes ink, and who keeps his nose within six inches of the table.

There should be provision made for the escape of respired air. A man needs thirty cubic feet of fresh air at least every hour, but in furnishing fresh air don't overdo it and lower the temperature too much. It is this mistake that has brought ventilation into discredit. In winter temperature should neither be 60 to 65, nor 75 to 80, but should be 65 to 70.

There is a strong temptation for our weary boys to take quack medicine. Don't do it. If you take anything, take exercise, and if that will not do take cod liver oil. We do not say that consumption is the only disease of telegraphers (we have known many dangerous cases simply from the habit of diluting water too much), but it is the principal one, the one incident to the profession and the one which lets more souls hence than all the others.

We would say then to telegraphers, attend to those simple physiological rules of health, modify as much as you can the unhealthful circumstances of sedentary employment, and you will lessen the victims of consumption in your ranks, and see a marked improvement in the health of telegraphers.

## The Influence of Large Offices.

SEPTEMBER 2, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

In the practice of telegraphy my attention has been arrested by the fact, that all the peculiarities of style, both as to the formation of characters, spacing, abbreviations, &c., indulged in by operators at the larger or terminal offices, are gradually adopted by those at the smaller offices. In another way the influence of large offices is shown, where wires are crowded with business, and orders have been given to prevent breaking, and contention for circuit; such orders, according to my observation, have been observed until the more important offices have given the example of disobedience, using press of business or other less important reasons for excuse. Impatience of error, and a feminine inclination to scold is invariably imitated by lesser offices, and the example almost as invariably given by greater ones.

I am convinced that by the cultivation of a spirit of patience, and a careful regard to proper example by operators at the larger offices, great benefit would result to all parties concerned; relieving the wires, saving time and improving the tempers of those engaged in the practice of the profession.

I do not desire to attribute to experts responsibility not properly theirs; but I do attribute to them the power to benefit both themselves and others, and claim that the self denial exercised would be amply rewarded by the happy results attained. D. S.

A new arrangement has come into operation at the German telegraph offices. Parts of telegrams, even single words, may now be registered, the Government undertaking to guarantee their correct transmission. Guaranteed words are underlined, and are simply charged a double rate. Hitherto, the charge has been the full double price of the whole telegram.

## The Science Association.

Professor Farmer's exhibition of electrical apparatus was in every way worthy the attention of the Association; but what are we to think of a person's being allowed to make an exhibition of his own patent fire annihilator, and to introduce into a crowded church a machine charged with carbonic acid gas to a pressure of nearly 200 pounds to the square inch?

Professor Van der Weyde exhibited his ingenious invention for the transmission of musical airs by electric telegraph. Great interest was manifested in it, and much regret expressed that the Professor had not made arrangements to show it in operation. Professor Morse's paper, the last one on the list, is said to have been very amusing, the Professor being a humorist of a high order, and having the gift of making admirable caricatures.

Mr. L. D. Parker, the successful and popular manager of the Western Union Telegraph office in this city, has been appointed to the position of chief clerk to Supt. J. J. S. Wilson, of Chicago, to fill the vacancy occasioned by the resignation of Jay Dickey. Mr. Parker left last night to assume the duties of his new position. While regretting that Quincy has lost so obliging an officer, we congratulate him on his promotion. Parker, here's our "73," and may it be many a year before there will be occasion to write "30" to your success and usefulness.—*Quincy Herald*.

HUMBOLDT, Pa., in our next.

TASMANIA and Australia are to have lines of their own.

The fire alarm telegraph is about to be introduced into Richmond, Va.

The machinery of the Boston fire alarm system has been rendered automatic.

SIR JAMES ANDERSON has withdrawn from his connection with the French Atlantic cable.

A plan for detecting faults in sea cables in time to prevent submersion has been proposed by Sir William Thompson.

MESSAGES to and from England and Bombay direct, may be looked for early in 1870, and Australia and China the year following.

A new light cable costing £450,000 is prepared to be laid between Ireland and Nova Scotia. We may expect now a flood of all such projects.

THE net product of the first week of the French cable was £577. The second week £746. The number of messages was 277 and 321 respectively.

THERE is a fault in the French cable against which £20,000 is retained in the company's hands until the contractors for laying the cable remove it.

So satisfied are European experts of the superior advantages of deep sea lines that submarine cables are taking the place of land lines wherever practicable.

THROUGHOUT Europe lines are built to aid or fraternize with existing organizations. In America, lines are built to make money in building and to oppose all other lines.

THE British Government designs establishing a Telegraph Maintenance Bureau to be manned by non-commissioned officers and members of the Royal Engineers.

OUR friend Mr. T. B. A. David has been presented with a fine watch and chain by his former employer. The presentation was made by Mr. David Fleming. None deserved it more.

THE International Mid-channel Telegraph for the convenience of the immense English marine service, will be working between Penzance, England, and a telegraph ship stationed by the Admiralty between Sicily and Ushant, in a few months.

### Death of John Bohanna.

By a dispatch dated Edgefield Junction, Tenn., September 12, we have the announcement of the death of John Bohanna, formerly of Mobile, Ala., at Edgefield Junction at 12 minutes past 2 o'clock of that day. Mr. Bohanna was a member of the Telegraphers' Mutual Insurance Association.

We have no particulars as yet of the circumstances of this death, but it is our duty to announce to the members of the Association that Assessment No. 9 will now be due, and to express the hope that it will be met promptly. Let the first act after reading this be to enclose one dollar to the Secretary, Mr. Downer.

#### ASSESSMENTS RECEIVED—NO. 9.

### The Anderson Fund.

E. C. Bush.....\$1 00	W. W. Wall.....\$1 00
Geo. E. Spellman..... 1 00	

HARRISBURG, Pa., August 25, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

My attention has been called to an article in your issue of August 16, in which my recently patented improvement in automatic telegraphy is commented on in a manner which seems to call for some notice at my hands. Permit me to state that I do not question your right as a journalist to express any opinion upon the merits or demerits of my automatic transmitter (not self-recorder), but in your attempt to throw a doubt upon the validity of my patent, your assertions are unsupported by evidence. You make an indefinite allusion to some plan that has been tried in Europe "by the use of metal strips indented in a similar way and to accomplish a similar purpose." All devices for automatic transmission are for the accomplishment of a "similar" purpose, and in all "similar" means are employed, the object being to reproduce telegraphic characters over a line in a more rapid manner than can be done by hand. In some methods this is accomplished by the perforated paper process. In others by the use of movable types. Another plan is that of Chaudassaigne and Lambrigt, who use the metal strip and a non-conducting ink; but none of these methods are like mine further than that the transmission is effected by the action of a lever, or its equivalent, in passing over the prepared strip.

You state that "this very process (mine) was one of Prof. Morse's earliest devices; that it forms part of his early papers, and if we mistake not is one of the specifications in his patents." If this is so, the fact can readily be ascertained. If it is not so, it must be

admitted that I have just cause to complain of an unwarrantable attempt to depreciate the value of my invention. I am aware that one of the earliest plans of Prof. Morse was the transmission of his characters automatically by the "type and port-rule" arrangement. I am not aware that he used his embossed or indented strips for that purpose.

My method consists simply in this: The transmission and reproduction of messages, automatically, from the embossed or indented strip as produced by the Morse process of recording dots and lines.

Was the Morse strip ever used to transmit from until I used it for that purpose? When? Where? By whom?

C. WESTBROOK.

[It is a source of sincere regret to us to be the cause of dispelling any hope excited in the mind of any friend of ours. In this case it is specially so. Prof. Morse personally assures us that this mode of transmitting, automatically, by use of indented paper, is fully described in his papers, and we have seen a letter from him to Mr. Vail describing its use. To this we called attention November 2, 1868. In our issue for June 1, 1868, will also be found a communication by M. F. Adams, Boston, describing the use of the same contrivance by T. A. Edison, in the experiment of a process of rapid transmission. All this, however, does not detract from the merit of Mr. Westbrook's invention, which, to him, was as truly an invention as if no other mind had ever suggested it.]

### The Energy of Lightning.

TIDIOUKE, Pa., Aug. 24, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

Did you ever think Mr. Editor what a desirable thing it would be to know something of the actual power of lightning, its real force so to speak, expressed in good avoirdupois pounds? so as to be understandable and comparable with other natural forces. I have often done so, and a few years since when studying up lightning arresters, I tried in various ways to approximately estimate it, and as a curiosity, perhaps, the following may be acceptable to your readers.

I suppose that every telegraph operator has read of Faraday's famous estimate of the comparative quantity of electricity in lightning and a current from a galvanic battery; from which he deduced that the absolute quantity of electricity in a powerful thunderstorm was only equal to that needed to decompose one grain of water. And, of course, all of us know the velocity of high tension electricity, as Wheatstone long since determined it. These two experiments are about all the electrical data we have; at all events all we shall use.

One grain of water is chemically the result of the combustion of one-ninth of a grain of hydrogen in eight-ninths of a grain of oxygen. Philosophers have determined that the combustion of one pound of hydrogen in eight of oxygen will produce heat sufficient to raise the temperature 62,032 pounds of water one degree Fahrenheit. Now one-ninth of a grain is one sixty-three thousandth part of a pound, so that the burning of this amount of hydrogen will raise but about ninety-nine hundredths of a pound of water one degree. For convenience sake we will call this one pound. Other philosophers, by a long series of carefully conducted experiments, have concluded that to raise the temperature of one pound of water one degree Fahrenheit, requires an amount of force equivalent to that needed to raise 772 pounds one foot high; which is then the mechanical value of the combustion of one-ninth of a grain of hydrogen in oxygen. The composition or formation of a grain of water producing this

amount of energy, an exactly equal amount will be required for its decomposition, however this may be accomplished; an exactly equal amount and no more. This is certainly no very astonishing amount of work for lightning, for a stout horse would do it in a little less than a second and a half. Yes, but lightning does it—in what time? Why at the rate of 288,000 miles, 1,520,640,000 feet in a second; hence, to lift 772 pounds avoirdupois one English foot, will take lightning but one fifteen hundred and twenty million six hundred and forty thousandths part of one second! a division of time, to our minds at least, infinitely small. The mechanical equivalent of lightning on these data is thus 1,173,934,080,000 pounds raised one foot high in one second. During the time it acts its work is equal to that of 2,134,425,600 horses. As artillery, and even editors of country papers constantly talk of "Heaven's high artillery" when alluding to the reverberation of the thunder, it furnishes in reality as well as in poetry the most magnificent park we can ever have. The initial velocity of shot from our big guns is but about 1,200 feet per second, and their weight is, of 15 inch shot about 475 pounds; 20 inch 1,100 pounds. Of such popguns as these Faraday's "powerful thunderstorm" would equal 1,267,200! half of each. Examples might be multiplied at pleasure, but these will suffice. Inconceivably tremendous as is this force, if employed in the decomposition of the water on which our calculations depend, it is by no means terrifying; consisting in the resolution of about one two hundred and fiftieth of a cubic inch of water, into about seven and a half cubic inches of mixed oxygen and hydrogen gases; an expansion of 1,875 volumes. The great fact to be always remembered (and I hope my operator friends who are now or may be lead to study the subject of arresters, will especially bear it in mind) is the infinitely short space of time during which the force operates.

T.

A COMMITTEE appointed by the French Academy of Sciences have under consideration a communication by M. Berthault. This gentleman suggests various means of utilizing the excess of force produced in working a locomotive. He shows that it might be used in causing a stronger adhesion of the wheels to the rails, so as to prevent the trains from running off, and that it might likewise be applied to the illumination of the carriages by electricity, and even to set the telegraph in motion.

### Personal.

L. E. Batherick, chief operator, Fitchburg, Mass., Western Union office, has resigned on account of ill-health, and is succeeded by Mr. Goodnon. "Bat." was a pleasant and faithful operator and we are sorry to lose him. He intends to "substitute" occasionally if his health permits. His address is Westminster Depot, Mass.

G. M. Smily has been appointed chief operator Western Union office at Grout's Corner, Mass., vice M. Richards resigned.

Colonel M. S. Colburn, formerly telegraph operator at Manchester, Vt., represents that town in the Legislature this year.

### Notice.

Two certificates, of two shares each, of the United States Telegraph Company, issued to Alexander Warner and James H. Warner, of New York, are supposed to have been stolen. The public are cautioned against their purchase.

JAMES D. REID,

Room 1, 145 Broadway, N. Y.

THE flame of a common blow pipe gives rise to a very marked electrical current, capable of affecting the galvanometer.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month, commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

One Dollar per Annum in Advance.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, SEPTEMBER 15, 1869.

### Manufacturing Public Opinion.

The persistence with which the interested parties in the passage of a postal telegraph law work to secure their object, crops out in the programme of all our great commercial conventions, no matter what may be the specific objects for which these conventions assemble. By a dexterous and earnest button-holing of the Committee of Arrangements, the "postal telegraph" is slipped in as one of the grand themes for discussion, thus giving to the country the idea of a national desire for the inauguration of governmental telegraphs. Nothing could be more false. There is no such national sentiment. Especially is there none which favors the schemes of personal advantage, so characteristic of the bills presented to Congress for competitive lines of telegraph under governmental aid, which propose the destruction, without any compensating advantages to the public, of existing telegraph property throughout the nation.

At the Mississippi Valley Commercial Convention, at Keokuk, Iowa, it will be seen that the same "Monsieur Tonson" presents himself again, and that the Committee of Arrangements duly announce the subjects of discussion, in which appears, modestly placed last on the list, "the Postal Telegraph." But this time the programme did not succeed as appears by the following dispatch:

"Mr. Howell, from the Committee on Order of Business, presented a majority report with the following subjects to be acted upon: First—The Mississippi River and its tributaries. Second—Foreign commerce. Third—Immigration. Fourth—The Postal Telegraph; and recommend that standing committees be appointed upon each of the foregoing subjects.

"The minority report proposes that the Convention shall consider all matters connected with the commerce and travel of the Mississippi and her tributaries, and not be confined to the four subjects mentioned in the majority report; that one subject included in the majority report, "Postal Telegraph," has no special application to the Mississippi Valley, while other subjects of great importance to the Mississippi Valley are excluded.

"The Committee recommend the following order of business: First—The Mississippi River and its tributaries. Second—Foreign commerce. Third—Immigration; and that the Convention shall then be open to consider other matters pertinent to these objects. The minority report was adopted."

But let no one think that the Convention will be allowed to adjourn without a resolution respecting the "Postal Telegraph." Probably at the close of the session, when the members are beginning to weary of talk and anxious to get home, a resolution favoring the Postal Telegraph system, deftly worded and skillfully introduced, will appear and be passed. Nobody will oppose it. It will be passed as complimentary resolutions are passed to please the parties concerned.

It will be passed when a vote of thanks to the moon for blacking the sun's eye would be equally successful. Long may it be before our government, forgetful of its proper functions, shall lower its dignity as the protector of labor, by becoming one of the shopkeepers of this great republic.

### Competition.

In general, competition, when fairly conducted, is healthy. It stimulates to activity, it encourages invention, it commands prudence. But successful competition has conditions to render it possible which every prudent man will examine.

Two men once started on a journey. One was Scotch, the other Irish. Coming to a roosting place one night, all the provisions which could be found was one small chicken. Pat regarded the bird attentively, and made up his mind that it was a slim supper for two. His partner was of the same mind, but was willing, Sawney like, to make the best of it. But on the proposal of Pat to leave it alone, and that it should belong, next morning, to the man who had the best dream, it was so agreed, and each went to sleep.

In the morning the Scotchman began to tell his dream. He dreamt that he was going up to Heaven in a basket amid the most beautiful music. No dream could be more delightful.

"Arrah," exclaimed Pat, "didn't I see you going up, and didn't I believe yez would never come down agin, and, be japers, didn't I git up and ate the bird up intirely."

There are a good many enterprises which will not admit of competition. The chicken is too small. A dream is often all which a competitor obtains. This is especially so of telegraphic enterprises. The field seems vast enough, and men are easily persuaded to embark in competitive lines without much examination. But time soon discloses the fallacy of their expectations. Fine offices do not draw business men from known channels, and the bait of tariffs below paying rates does not help the balance-sheet. Competition is only possible where there exists an unsupplied demand, or where existing enterprises are false to their mission. The almost universal failure of opposition telegraph lines is the highest tribute to the general justice and fairness of the management of the organizations with whom they proposed to compel a division of the public money. By doubling the amount of working expenses, the chicken has disappeared, and one of the parties has gone up in a basket. We say nothing of the music or the destination.

We were not surprised, therefore, when the following appeared in the morning papers. It ought to be a lesson. The complaint of losses in endeavoring to provide the dear "public" with competitive lines, is the veriest humbug. It is the loss of expected profits which makes the funeral. This service to the "public" is the refrain of the telegraph contractor's song by which he secured his margin of \$200 or more per mile. Still, it comforts a dying hour, and in charity we admit the consolation.

We hope our French friends will take care. They have been earning one-third of one per cent. on their

capital. That seems a small chicken. We fear the soup will be very *maigre* even for Frenchmen. Glory is a good thing no doubt, but somehow people prefer dividends, and do not complain when these are fat:

SAN FRANCISCO, Sept. 14.—The Western Union Telegraph Company have purchased the lines of the Atlantic and Pacific States Telegraph Company for about 60 per cent of their actual cost of construction. By this arrangement the old Company is enabled to increase its facilities for doing business at once, instead of waiting for the construction of new lines over the same territory, which they had in contemplation. The purchased property was all new within the year, and in excellent condition. Its late owners complain bitterly of their heavy losses in the efforts to give the public competing telegraph communication.

The Western Union has not increased its rates anywhere in consequence of the "consolidation," but will announce a material reduction to all points on the 1st of October prox.

### Perpetuity of Telegraph Lines.

One great cause of the want of confidence in Telegraph stock has been the ephemeral appearance of many telegraph structures, and the impression thus conveyed of its evanescent character. As a business, the telegraph takes daily a deeper hold of the public mind. Day by day new minds awake to its use to whom it had previously been a mere object of curiosity. The world would be thrown back in dismay were the wires removed from the uses of society. But the structures have been, almost of necessity, more or less perishable.

To remove this feature as much as possible has been a matter of proper concern to telegraph managers. Iron poles were at one time procurable at low cost, and were seriously proposed to be used along our principal routes. The cultivation, also, of the locust, one of our firmest and most enduring woods, has been urged, and is worthy of attention. Red cedar and cypress also are good.

Our attention is now called to a process which, by the use of creosote oil applied in a peculiar way to the base of poles already erected, the process of decay is arrested. It is simple, and seems effective. Creosote oil, or carbolic acid, is known to be a great antiseptic. The patentee is sanguine in the belief that the preservation of poles may be rendered perpetual. We hope to see it tried. This accomplished, one great step towards the removal of the perishable character of telegraphic structures will have been effected. It is an object highly desirable. The patent is known as the "Robbins' process for seasoning wood."

### Influence of Large Offices.

In a brief communication which will be found elsewhere, the influence of large offices is stated as not only forming the manner of using the key, but determining the morale of the offices on the wires on which the central force is employed. We are entirely satisfied with the correctness of the statement. One good, prompt, courteous, attentive man at the end of a way wire, can, and usually does, infuse all his characteristics into every office through which his wire passes. Here is a means and opportunity of effective useful influence which a true man will neither omit or despise. If that man is a blessing to the world who causes two blades of grass to grow where one grew before, so is every man who in the conscientious, steady, courteous performance of any toil inspires his fellows with his own spirit.

## EXECUTIVE ORDER NO. 82.

## NEWFOUNDLAND BUSINESS—REDUCTION OF RATES.

On and after Monday, September 8th, 1889, the tariff on business with all points in Newfoundland will be as follows:

	For 10 words or less, count- ing address, date and signature.	For each word over 10
From all points in Nova Scotia, and New Brunswick in gold, . .	\$2 50	.25
From all points in New England and New York City in currency, . .	3 50	.35
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Mary- land and District of Columbia in currency, . . . . .	3 90	.39
From all points in Virginia, West Vir- ginia, North Carolina, South Caro- lina, Georgia, Alabama, Missis- sippi, Louisiana, Tennessee, Ken- tucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Co.'s offices in Florida in currency, . . . . .	5 60	.56
From all points in Texas, Arkansas, Missouri (except St. Louis), Kan- sas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, Utah, Idaho and Montana in currency, . .	7 70	.77
From all points in California and Ne- vada in gold, . . . . .	5 50	.55
From all points in Oregon, Washington Territory and British Columbia in gold, . . . . .	7 50	.75

Note particularly that address, date and signature are to be counted and charged for as upon Atlantic Cable Business. The rates above given are in currency, except for Nova Scotia and New Brunswick, and for California, Nevada, Oregon, Washington Territory and British Columbia, which are in gold.

All offices will check Plaister Cove, Nova Scotia, on this business, and will enter the entire tariff for "This Line."

On business paid in Newfoundland, check Plaister Cove for "This Line," the gold tariff from Plaister Cove as follows:

	For 10 words or less, counting address, date & signature.	For each word over 10
To Nova Scotia and New Brunswick,	50	05
To New England and New York City,	78	08
To New York (except N. Y. City), New Jersey, &c., . . . . .	1 08	11
To Virginia, West Virginia, &c. . .	2 28	23
To Texas, Arkansas, &c., . . . .	3 78	38
To California and Nevada, . . . .	3 78	38
To Oregon, Washington Territory and British Columbia, . . . . .	5 78	58

## LIST OF OFFICES IN NEWFOUNDLAND.

Brigus,	Heart's Content,
Bay du Nord,	Harbor Grace,
Bay de Lievre,	Long Harbor,
Black River,	Port au Basque,
Chapel Arm,	Placentia,
Conn. River,	Rose Blanche,
Carbonear,	St. John's,
Grandy's Brook,	Salmonier,
Garia,	White Bear Bay.
Holyrood,	

Newfoundland tariff applies also to St. Pierre, M. I.

WILLIAM ORTON, President.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
SEPTEMBER 15, 1889.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since September 1st, the date of the last tariff order.

These changes should be entered in your tariff book, as they are given under the heading "NEW TARIFF SYSTEM." The rates given herewith under "New Offices," will be used until October 1st, when the new system will take effect.

## NEW OFFICES.

Big Lick, Va., tariff same as Salem, Va.  
Chandlerville, Ill., tariff same as Ashland, Ill.  
Chickahulla, La., tariff same as Brashear City, La.  
Edwards' Depot, Miss., reopened, tariff same as heretofore.  
Forest City, Ill., tariff same as Lewistown, Ill.  
Havana, Ill., tariff same as Lewistown, Ill.  
La Grange, Ga., reopened, tariff same as heretofore.  
Little Indian, Ill., tariff same as Jacksonville, Ill.  
Lewes, Del., tariff 25 more than Harrington, Del.  
Morse's Station, Ky., tariff same as Mayfield, Ky.  
Richmondville, Mich., tariff 25 more than Port Huron, Mich.  
Ware, Mass., reopened, tariff same as heretofore.

## NEW OFFICES ON OTHER LINES.

Exeter, Pa., tariff 35 and 3 from Philadelphia or Harrisburg. Check which ever gives cheaper rate.  
Weehawken, N. J., tariff 20 and 2 from New York. Check New York.

Silver Lake, N. Y., } 30 and 2 from Fishkill, N. Y. Check  
Lagrangeville, N. Y., } Fishkill.  
Bangall, N. Y., 35 and 3 from Fishkill, N. Y. Check Fishkill.  
Pine Plains, N. Y., 40 and 3 from Fishkill, N. Y. Check Fishkill.

## OFFICES CLOSED.

Chittenango Springs, N. Y.; Rocky Point, R. I.; Berkeley Springs, Va.; Jordan's W. S. Springs, Va.; Huguenot Springs, N. Y.; Anderson, Texas; Snake River, Idaho; Deal, N. J.; Squan, N. J.; Princess Anne, Md.; Ocean House, Rye Beach, N. H.; Boar's Head, Hampton Beach, N. H.; Glen House, N. H.; Crawford House, N. H.; Profile House, N. H.; Pequot House, Conn., and Lake Mahopac, N. Y.

## GENERAL INFORMATION.

The name of the office heretofore known as Bottsville, Mo., has been changed to Meadville, and Washington Four Corners, N. Y., to Millbrook.

Business which has heretofore left this line at Ogden, will hereafter leave at Corinne, Utah.

## THE NEW TARIFF SYSTEM.

The following named offices, some of which have just been mentioned as new offices opened, with rates to be used until 1st October, you will enter in the new tariff book (new system) as follows:

## IN PART I.

397 Alpine, Iowa.	38 Montreal Junction.
* Bangall, N. Y.	231 Napoleon, Mich.
153 Big Lick, Va.	320 Morse's Station, Ky.
347 Bryant, Ill.	426 Perry, Iowa.
488 Calvert, Texas.	240 Pewamo, Mich.
347 Chandlerville, Ill.	* Pine Plains, N. Y.
385 Chickahulla, La.	189 Richmondville, Mich.
288 Clark's Station, Ind.	426 Ripley, Iowa.
231 Clinton, Mich.	280 Rochester, Ind.
426 Dallas, Iowa.	* Schoharie C. H., N. Y.
* Exeter, Pa.	316 Shapiere, Wis.
347 Forest City, Ill.	* Silver Lake, N. Y.
435 Grand Junction, Iowa.	231 Swanton, O.
347 Havana, Ill.	231 Tecumseh, Mich.
202 Haydenville, O.	330 Troy Station, Tenn.
* Lagrangeville, N. Y.	313 Tuscaloosa, Ala.
48 Lewes, Del.	426 Valley Junction, Iowa.
358 Little Indian, Ill.	500 Waco, Texas.
202 Logan, O.	426 Wauke, Iowa.
231 Manchester, Mich.	280 Walkerton, Ind.
418 Meadville, Mo.	240 Whites, Mich.
* Millbrook, N. Y.	* Weehawken, N. J.
426 Minburn, Iowa.	

Plattsmouth, Neb., Edward's Depot, Miss., La Grange, Ga., and Ware, Mass., should be noted as reopened, and the offices named under the heading "Offices closed" noted "closed."

Those offices given in Part II. without rates are now closed and will be so noted in "Remarks" column, Part I.

The following offices with rates should be entered in PART II:

	Tariff for other lines.	Leaves this line.
Bangall, N. Y. . . . .	35 8	Fishkill, N. Y.
Exeter, Pa. . . . .	35 8	Philadelphia (or Harrisburg, if rate to Harris- burg added to 35 and 3 is less than Phila. ad- ded to same amount).
Lagrangeville, N. Y. . . . .	30 2	Fishkill, N. Y.
Millbrook, N. Y. . . . .	30 2	Fishkill, N. Y.
Pine Plains, N. Y. . . . .	40 3	Fishkill, N. Y.
Schoharie C. H., N. Y. . . . .	25 2	Central Bridge, N. Y.
Silver Lake, N. Y. . . . .	30 2	Fishkill, N. Y.
Weehawken, N. J. . . . .	20 2	New York City.

## CORRECTIONS.

Pittsford, N. Y., is in square 92.  
Port Austin, Port Hope, Huron City, and Bock Falls, Mich., incorrectly given in last JOURNAL, in square 189, are in square 179.

The tariff to square 189 should be 10c. more than to square 200, and to square 179, 20c. more than square 200.

The repeating office at Ogden, Utah, has been removed to Corinne, Utah. Please change the name "Ogden" where it occurs in column "leaves this line" in Part II, to "Corinne." Tariff to Corinne 300 more than Omaha, Neb.

It has been observed that in a number of the new tariff books marked Dist. I., the printer has omitted the rates in the "remarks" column of pages 81 to 94 inclusive. Please examine your book, and if you find it incomplete in this respect, make the corrections as follows:

New Castle, Cal., 300 currency, 225 gold, more than Omaha. Check San Francisco.  
New Glasgow, N. S., 85 currency, 60 gold, more than Calais.  
New Westminster, B. C., 775 currency, 575 gold, more than Omaha. Check San Francisco.  
North Fork, W. Y., 250 more than Omaha.  
North Platte, Neb., 150 more than Omaha.  
Norton, N. B., 35 currency, 25 gold, more than Calais.  
Oakland, Cal., 425 currency, 315 gold, more than Omaha. Check San Francisco.  
Oakland, Or., 675 currency, 500 gold, more than Omaha. Check San Francisco.  
Ogden, Utah, 300 more than Omaha.  
Olympia, W. T., 675 currency, 500 gold, more than Omaha. Check San Francisco.  
Oreana, Nev., 300 currency, 225 gold, more than Omaha. Check San Francisco.  
Oregon City, Or., 675 currency, 500 gold, more than Omaha. Check San Francisco.  
Oroville, Cal., 525 currency, 390 gold, more than Omaha. Check San Francisco.  
Painsec Junction, N. B., 50 currency, 35 gold, more than Calais.  
Penobscus, N. B., 40 currency, 30 gold, more than Calais.  
Perry, Kas., 35 more than Lawrence, Kas.  
Petaluma, Cal., 475 currency, 350 gold, more than Omaha. Check San Francisco.  
Peticodiac, N. B., 40 currency, 30 gold, more than Calais.  
Piton, N. S., 75 currency, 55 gold, more than Calais.  
Pike, Nev., 300 currency, 225 gold, more than Omaha. Check San Francisco.  
Placerville, Cal., 300 currency, 225 gold, more than Omaha. Check San Francisco.  
Plaister Cove, C. B., 105 currency, 75 gold, more than Calais.  
Pleasanton, Cal., 300 currency, 225 gold, more than Omaha. Check San Francisco.  
Pleasant Valley, Idaho, 350 more than Omaha.  
Point du Chene, N. B., 50 currency, 35 gold, more than Calais.  
Portland, Or., 675 currency, 500 gold, more than Omaha. Check San Francisco.  
Port Mulgrave, N. S., 105 currency, 75 gold, more than Calais.  
Pugwash, N. S., 70 currency, 50 gold, more than Calais.

On and after October 1, offices in Dist. A, and offices in squares 7 to 40, inclusive, and 45 and 46, will collect 15c. more than rate to square 41 for all points on LONG ISLAND.

WILLIAM ORTON,  
President.

## An Anxious Inquirer.

## SPECIAL TELEGRAPHIC FACILITIES.

On our return from the buttermilk and barley fields of Western New York, there came into our official den a genteel looking gentleman whose clear eye and spinal curve at once indicated him to be a searcher after knowledge. His very presence was a compliment, for his demeanor seemed to say, I desire information which it is in your power to give. So we seated him kindly, and expressed by many facial signals that we were not unwilling to communicate to him all we were supposed to know.

The usual salutations ended, the conversation proceeded as follows. The stranger being unknown to us we will designate as S., the editor as E.:

S. Your last paper contained an article headed "Special Telegraphic Service," which I have read with care, and respecting which I desire to speak with you. May I speak to you freely?

E. Certainly. The article you name was somewhat of a "Midsummer Night's Dream," written on the sill of a farm house window, under the doubtful inspiration of the barnyard and the moon, yet the subjects are full of unquestionable importance, and merited more careful statement.

S. Any statement which excites inquiry is proof of its value, even though the premises be false, men do not concern themselves respecting follies. Now let me ask you whether the proposition to give the instant use of a wire to any one who may be able to pay for it, has not in it the elements of great danger?

E. Unquestionably it has, and no such opportunities can ever with safety be given except under circumstances so clearly defined and so justificatory of their provision as to commend them to popular approval, and to permit and make possible legal guards for their use. Some of these circumstances in which preference is accorded are already acknowledged. When death is imminent, the instinct of reverence for sorrow takes the message which seeks to avert or to announce it and gives it preference. That instinctive tribute to grief is endorsed by the public conscience, which is the highest form of law, and which the law is designed to illustrate.

There is another appeal to preference in the escape of fugitives from justice, which the public conscience also accepts, and which legislation has demanded. These cases appeal to that instinctive justice and propriety which command an unquestioning approval. So also in times of national danger, and in lesser perils, the wires are seized and used without a murmur. But as soon as the boundary of these great pleas of peril or grief is crossed then the limits appear, and the same public conscience stands guard against further encroachment.

S. Then you do not approve of the proposal to provide a wire by which men who are willing to pay for the privilege can come and secure a certain instantaneousness of transmission which shall accomplish purposes not securable by ordinary means?

E. In the present condition of public sentiment on such matters, such a facility, if allowed by law, without the most stringent guards, might poison the public activities and debauch society. In this very opportunity is to be found one of the deep laid schemes in the provisions of the Postal Telegraph Bill proposed in Congress during its last session, by which opportunity is given to impose a tariff proportioned to the extent of favor given. Money would, in such a case, decide privilege, a monstrous proposition which no legislature, however corrupt, could present boldly to any people, and command popular approval. Yet it is true that there are men who believe that, in some limited form, a wire can without injustice be provided, which, by offering an assurance of the immediate transmission and delivery of a message in a specified time, and on which a corresponding tariff might be imposed, would meet one of our supposed social and commercial necessities. Can you not appreciate possible circumstances in which such a provision might be just?

S. I do not believe in exceptional justice. The only safety is in treating all alike. The poor man's message has as much value to him as mine. I ask no advantages.

E. Of course. Your position is safe. The law and public conscience agree with you. But let me suppose a case. It is now 10 minutes to 3, P. M. You have a note due at Philadelphia to-day. You have just secured the funds to meet it. You have a bankers' message certifying to that fact, and if delivered before 3, your credit would be saved. You are not absolutely certain that, if placed on the file of the telegraph office, it would be delivered in time, as there may be many messages, or even one, before yours, which would peril it. Now, can you not conceive of a wire held for such emergencies, which, under regulations of strict justice and impartiality, with a capacity and a mode of transmission which would render the act of sending instantaneous and infallibly correct, as being within the legitimate hopes of society and susceptible of provision without outraging your own sentiments of justice and propriety?

S. In the case supposed there seems as if no wrong might be done, but let me suppose another. A business house in Boston is in trouble. The creditors in New York are alarmed. My neighbor sends a telegram to his Boston lawyers to attach the goods of the suspected house. I hear of this. I also go to the telegraph office, and, by payment of a larger tariff, get my message to my lawyers to attach in my behalf ahead of my neighbor. Now, without reference to the honor involved in procedures of this kind, is there no injustice in the opportunity given to get advantage of my neighbor?

E. There can be no question, I freely admit that the proposal is fruitful of evil. Yet in some respects these wires compare with other modes of conveyance. If your neighbor sent his message by mail, or desired it to be sent at night by telegraph to save expense, or by day by the ordinary wires, when he knew of this

quicker method which would be as available to him as to you, your use of the fast method or wire could be no injustice, and the result would be due to your energy and outlay. Now, while protesting against the introduction of any scheme which shall give any man an advantage denied to any other, does there not appear to you a possibility that, in the future, this power and opportunity of the instant transmission of dispatches may become one of the elements of progress in meeting the necessities of our life, which is constantly assuming new relations and demanding new helps?

S. I cannot dogmatize against such a possibility, although I instinctively fear it. If society were pure the case would be different. I fear the power of money brought into the possible absorption, or the control, or any undue advantage in the use of the avenues of public correspondence. The administration of the American telegraph lines has, so far, been unsullied. I desire them so to remain. Yet I can not deny that there are occasions when I myself might accord the justice of permitting a preferential service, but never as a system. The true provision for all such necessities is in enlarging the means of transmission, or in increasing their capacity.

E. If your convictions are representative of the public judgment, they inspire the utmost hope for an honorable future to the telegraph, yet we cannot afford to despise suggestions from whatever source in connection with these wondrous agencies. So when selfishness comes with what seems a bribe in its hand to degrade the telegraph, it puts men on the defensive, keeps awake public virtue, and stirs inquiry.

S. One word more. Does the telegraph company invariably refuse to give assurance of instant transmission to messages, no matter what the circumstances may be, aside from those you have named? Must we remain in doubt respecting the delivery of messages I or others may offer? Can no promise be properly given?

E. No manager of a telegraph office is allowed to promise *anything* except that a message will be transmitted. He may assure you of attention, he may gratify you with a statement of the splendid condition of the wires, as some enthusiastic receivers do, he may tell you that he knows of nothing to prevent the immediate transmission of your message, but to promise you transmission in season for your purpose, he is not allowed. He will do all he can, but to engage to deliver before a certain time, he cannot, without *pledging the company to the consequences of failure*. This would be insuring a message *without consideration*, and, for a paltry sum, assuming the duty of assuredly saving your honor. No company will do this. No agent of any company is allowed to do this. To do it might compel the very offence you denounce, of giving you preference over others. And yet your question shows that you appreciate the value to you of such a service, could it be safely given.

S. Let me interrupt you a moment. To what extent does the insurance of a message go? Is there no engagement of delivery?

E. There is an engagement to deliver, *correctly*, the message insured, and for this a certain tariff is charged. But this does not include any agreement to deliver, *within a given time*, which is the subject of our conversation. What, in the judgment of some minds, the system now lacks, is this very pledged assurance of delivery *within a given period*, a thought suggested to every mind on leaving a message, and which the general reputation of the telegraph company for promptness is the only guarantee which can be given. Messages were never delivered more promptly or more accurately than now, and all that the reasonable multiplication of wires and skilled service can accomplish for this is done. Yet the distinct assurance of delivery within a specified time remains unprovided, and which can only be done by such special acts of service, and the means of their performance, such a knowledge of the possibilities of delivery, such a holding of carriers for this purpose, as at once shows how much care and thought and expense are required to effect it, if, indeed, as a system, it can be done at all. The evils it may introduce, may, for ever, prevent its introduction.

**THE STORY OF A DISCOVERY.**—The electric telegraph plays an important part in the engagement of artists, but until now we do not remember of an artist having been actually obtained by wire. Within the last few days, however, electricity has kindly yielded one of her votaries to the art. Herr von Hulsén, the Intendent of the Theatres at Berlin, was taking a walk at Karlsbad, when passing a telegraph office he heard the sound of an extraordinary sweet tenor voice. Entering the office he found a clerk singing over his work. M. Von Hulsén put some leading question touching the young man's knowledge of music, and requested him to sing a few roudades, which were given *ad satisfaciendum*. The result was, the Intendent engaged him then and there, and the happy official had the gratification of telegraphing on the spot to Prague, before sending in his resignation. "Have just been found out by Hulsén—taken off to Berlin—two thousand thalers a year provisionally." The clerk's name is Pavlicek, but they will probably find him one more euphonicus.

**A LETTER** from J. D. Waterman, Lodge Pole, Neb., written to us so long ago as to cause us a feeling of shame to refer to it, asks the comparative speed of the House and Morse machinery.

The possible speed by the Morse and Printing instruments do not greatly vary. The new instrument of Mr. Phelps, which is the finest form of printer, has accomplished 55 words per minute, or ten more than the Morse.

The average work of the two modes is in favor of the printer, as must all machinery which reduces the physical labor of the operator and gives the maximum work to the mechanism. Thus a printing operator can keep up without exhaustion, and with regularity, a higher average than the Morse.

**THE manual labor system** at Cornell University appears to work well. One student supports himself by cabinet making, another by printing, another by photography, while others work on the farm. One young man who sweeps the rooms and makes fires has taken the first prize in science and German!

### Magneto-Electric Machine.

D. F. J. Lontin and E. L. C. d'Ivernois, Paris, France.—This invention, which comprises new arrangements and applications of the magneto-electric machine, consists in certain improvements upon that class of machines which have, upon the same rotating axis, several bi-branched soft iron armatures having the form of electro-magnets, but non-magnetized, and the parts or poles of which (were these armatures magnetized) are placed on the same circumference, the curve of which they assume; second, in uniting several electro-magnets (magnetized one first time from any source), fitted outside the circumference described by the soft iron armatures, so that their poles may be placed very close and in a concentric circumference to the former one.

We do not favor that glib and irreverent use of biblical language which some seem to delight in, by which they seek to give point to a joke or a body to their wit. Yet there are some uses of bible language which are both delicate and convenient. A message passed over the wires the other day from Gardiner, Me., to Boston, which read thus:

"Isaiah IX, vi., first clause."

Which reads "For unto us a child is born, unto us a son is given." A very joyful event no doubt to that Gardiner household, and which, without any reflection upon the religious education of the Boston office, probably passed unknown to the Boston family for their sole enjoyment. It was the language of joy and gratitude. It had a sacred connection. It was used to express the happiest event which comes to our domestic life. It was no doubt a first boy over which in the parental vision all the bells of heaven were ringing.

In the description of the champion players of baseball in Oswego, N. Y., we find the following respecting one of our old boys:

John Fuller, telegraph manager, mercurial player but not fleet, 37 years old, weight 158 lbs. Politics—"Western Union" Republican.

John is not fleet, but steady as a rock and sure as the sun.

From a letter from Charles T. Dozier, Vallejo, California, we extract as follows:

"I have invented an instrument by the use of which the Morse sounders can be used in ocean telegraphy. The construction is exceedingly simple and it will work with as *light currents* as will the most delicate reflecting galvanometers now used in operating the Atlantic cables, and will be able to do twice the work, with far more ease to those operating it."

If Mr. Dozier has really discovered a mode of accomplishing what he states, he will have the thanks of all the world, and especially of the cable operators who now work in dark rooms interpreting in continuous night the "hand writing on the wall."

JOHN Jay Dickey, Chief Clerk in the office of the Superintendent of the Western Union Telegraph Company, in Chicago, has received the appointment of Superintendent of the Union Pacific Telegraph Line, with headquarters at Omaha.

CARFETS are bought by the yard and worn by the foot.

WITHOUT the rich heart, wealth is but the ugly beggar.

VANITY is a strong drink that makes all the virtues stagger.

### A Telegrapher's Silver Wedding.

RUTLAND, Vt., Sept. 11, 1889.

EDITOR JOURNAL OF THE TELEGRAPH:

Mr. and Mrs. J. W. Smith, of Ludlow, Vt., celebrated their silver wedding on Wednesday evening, the 8th inst. It was an occasion of rare interest and was attended by a large number of friends. A special train conveying Gov. Page and about forty guests left Rutland at 7:30, P. M., arriving at Ludlow at 8:30. Mr. Smith has been railroad and express agent and telegraph operator for the past fifteen years—owns a fine residence and spacious grounds, which, together with a pavillion erected for the occasion, were tastefully decorated and brilliantly illuminated. The gifts amounted in value to over four hundred dollars; among which I noticed a silver tea set from Dea. J. R. Smith of Fond du Lac, Wis. A French china breakfast, dinner and tea service from their friends in Ludlow. Silver ice pitcher and goblets—the latter representing a telegraph man setting poles—from Mr. Smith's telegraph associates. Coffee urn, oysterureen, cake basket, butter dish, spoons, knives, forks and many other articles of value from other friends. All present seemed to enjoy themselves, and at a late hour departed well pleased with the kind reception tendered them by Mr. and Mrs. Smith. R.

### STICKWELL & CO.'S

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

"That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding 'or any other man.' It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor.

### THE STANDARD

AMERICAN WORK ON THE TELEGRAPH.

MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS

SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUVER, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SABINE.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—*The Telegrapher*.

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—*London Mechanics' Magazine*.

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—*Journal of the Telegraph*.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS,

PUBLISHERS,  
28, 30, 32 Centre Street.

# Journal of the Telegraph.

## A Manly Rebuke.

There is something exceedingly noble in the conduct of Gen. Zietlien, a favorite officer of Frederick the Great, when he was entertained at that monarch's table. The story is one of the "beauties of history." The king was bantering the old soldier on his religious observances. He had been invited to the royal table on Good Friday and declined, as it was his custom on that day to receive the sacrament and occupy himself with religious meditation.

"Well, how did the sacrament on Good Friday agree with you? have you digested well the real body and blood of Christ?"

The merry company of Sans Souci laughed at the kingly sally which the meanest of his subjects should have despised, when the venerable Zietlien rose:

"Your majesty knows," he said, "that in war I have never feared any danger; and that, whenever it was required, I have resolutely risked my life for you and for the country. This feeling still animates me; and if it is of any use, and you command it, I will obediently lay my head at your feet. But there is One above us who is more than you or I, more than all men—the Saviour and Redeemer of the world—who has dearly purchased salvation for us with his blood. That Holy Saviour I cannot allow to be ridiculed, for in Him rests my faith, my trust, and my hope in life and death. In the strength of this faith your brave army has courageously fought and conquered; if your majesty undermines it, you undermine at the same time the welfare of the State. This is a true saying indeed. May it please your majesty to excuse my freedom."

## A Black Eye.

The Rev. R. Balgarnie, of Sarbro', gives the following story told to him during a visit to the Catskill Mountains. A gentleman of the party said;

"John Brown once gave me a black eye."

I looked into his face and said:

"I have a profound respect for your eye from that circumstance. Tell us how it happened."

He said:

"I was then a young land surveyor, and was engaged professionally in a certain district. At dinner time a tall, bony, awkward man sat down at the table in his shirt sleeves, I thought it rude behavior, and remonstrated with him. He took no notice until, in my warmth, I challenged him to fight. The challenge was accepted, and we went out into the yard to have it out. Having taken lessons in the art of boxing, I thought the man was no match for me. I had just put myself into position, according to the rules, when, lo! something came between my eyes like an iron pump handle, and I fell senseless to the ground. After recovering myself, my antagonist who was supporting me, coolly said, 'Young man, the best thing you can do with that eye, is to apply a little raw beef to it.'"

## The Proof.

Some years ago, a Frenchman, who, like many of his countrymen, had won a high rank among men of science, yet denied the God who is the Author of all science, was crossing the Great Sahara in company with an Arab guide. He noticed with a sneer that at certain times his guide, whatever obstacles might arise, put them all aside, and kneeling on the burning sand, called on his God. Day after day passed, and the Arab never failed; till at last, one evening, the philosopher, when he arose from his knees, asked him with a contemptuous smile:

"How do you know there is a God?"

The guide fixed his burning eye on the scoffer for a moment in wonder, and then said, solemnly:

"How do I know there is a God? How did I know that a man and a camel passed my hut last night in the darkness? Was it not by the print of his foot in the sand? Even so," and he pointed to the sun, whose last rays were fading over the lonely desert, "that footprint is not of man."

The *Lancet* says toothache can be cured by one drachm of collodian added to two drachms of Calvert's carbolic acid. A gelatinous mass is precipitated, a small portion of which, inserted in the cavity of an aching tooth, invariably gives immediate relief.

## SPECIAL NOTICE

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## CHARLES WILLIAMS, Jr.,

109 Court Street,

BOSTON, MASS.,

MANUFACTURER OF

TELEGRAPH INSTRUMENTS,

BATTERIES,

AND MATERIALS OF ALL KINDS.

WM. KIDD,

A. BOODY.

C. H. PEIRCE,

O. S. OTIS.

## KIDD, PEIRCE & CO.,

BANKERS,

NEW YORK.

Stocks, Bonds, Gold and Government Securities bought and sold on Commission.

## S. S. STAFFORD'S

COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 33½ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

## A. S. CHUBBUCK,

HOTEL STREET,

(Adjoining the Post Office.)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

## CHAS. T. & J. N. CHESTER,

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS,

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## CHESTER, PATRICK & CO.,

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA,

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH,

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

## Improved Telegraph Wire.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

### THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

### THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

### GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

### THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET,  
PHILADELPHIA.

The guarantees of this insulator are:

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.

# JOURNAL OF THE TELEGRAPH.

NEW YORK, OCTOBER 1, 1869.

WHOLE NO. 46.

(For the Journal of the Telegraph.)

**Albert Drecker.**

BY THOMAS J. HYATT.

Calm at his station the bridge-tender stood;  
The bridge was open over the flood.  
Off in the distance rumbled the train;  
The open draw must be closed again.  
Slowly he turns it—steady and slow—  
Over in safety the train will go.

A cry of terror! Into the stream  
He gazes, as in a horrid dream!  
His boy, a moment since by his side,  
Is struggling now in the moving tide.  
A single minute—a hasty spring—  
The sturdy tender the child could bring  
Safely up from the waters below.  
Why does he linger? Will he not go?  
Nearer and nearer rumbles the train—  
The open draw must be closed again.

A sweat, as of death, is on his brow;  
Were the world his own, he'd give it now  
To save his son that is drowning there:  
But the train a hundred lives may bear,—  
A hundred lives that are in his care,—  
And though his face is white with despair,  
And his brain the fires of torment burn,  
Steadily still he must turn and turn,  
For nearer and nearer speeds the train—  
The open draw must be closed again.

He is using strength ne'er used before,  
The sweat is dripping from ev'ry pore,  
He hears his child's last smothering cry!  
He must save it now, or it will die!  
Thundering onward staggers the train—  
The open draw must be closed again.

Battling and conquering self and love—  
Winning a fight recorded above—  
He has closed the open draw at last,  
As a screeching fiend, the train has passed.  
Down from the bridge like a flash he sped—  
Only to clasp in his arms the dead,  
Only to look on the sacrifice  
Offered to duty, of love and life.

Pale is the luster of mighty deed  
Wrought for distinction with hungry greed,  
For Albert Drecker hath put to shame  
Its storied greatness and tarnished fame;  
And where his simple story is told,  
Let it be blazoned in lines of gold,  
Shaming ambition, power and pride,  
"Plain Albert Drecker himself denied."

**Western Union Telegraph Company.**

**ITS POLICY.**

(From the President's Annual Report.)

The policy which the Company has pursued during the past three years has been to pay only moderate dividends, and to devote the remainder of the net earnings to the reduction of the debt and the improvement and extension of the lines. It has not sought the appreciation of the market value of the stock by the payment of large dividends, believing that the true interests of the stockholders require that a considerable portion of the current revenue should be expended in increasing the facilities for doing business, in order to be able to cope satisfactorily with the constantly increasing traffic. The property has not been managed as a leased estate, from which the largest amount of revenue was to be obtained in the shortest possible time, but as a valuable permanent investment, to be improved and enlarged with a just regard to its future value as well as its present income. For the same reason the tariffs have not been made with the view to obtain the greatest immediate returns, but the aim of the Company has been to give the use of the wires to the public on the lowest terms consistent with a proper self support, and the just return which capital and skill are entitled to receive.

We have sought, by the enlargement of our facilities, the employment of the best skilled labor, and a constant but gradual reduction of tolls, to transmit telegraphic correspondence better and cheaper than it can be done by any other organization, and thus, through these inducements, to secure and permanently control the greater portion of the telegraphic business of the country.

**THE POLICY OF THE FUTURE.**

As the telegraph is already essential to the proper conduct of the varied business which constitutes interstate commerce, it follows necessarily that its extension into new territory, and the increase of facilities in that now occupied, must keep pace with the growing demands of this rapidly increasing traffic. Not only must the telegraph keep pace with the railroads, but hereafter, as heretofore, frequently precede them. The lines of this Company now occupy every important railroad route in the country, and upon most of them arrangements exist whereby small offices are maintained and the lines kept in repair at the joint expense of the railroad and telegraph companies. By this means many communities enjoy the benefit of telegraphic facilities whose business alone would not defray the cost of operating an office. It is an established rule of this Company to open an office at any place through which our lines pass where the receipts will equal the expenses. If such a result appears doubtful, the guaranty of a few responsible citizens against loss is accepted. The immediate benefit to the Company in such cases is of course inconsiderable, yet they are rare in which some profit is not realized. The business sent to such offices,

however small the amount, is gain, and the use of the telegraph begets necessities for its further employment, so that an office which is barely self sustaining the first year is pretty certain to yield a profit the second. If it is good policy to open offices wherever they can be made self sustaining, it would be manifestly unwise to stop the extension of our lines at their present termini, and leave the avenues opening by railroads to new and profitable business beyond to be occupied by our competitors. With but few exceptions, wherever a railroad can be profitably operated, the telegraph is a necessity, and will return a liberal interest on the capital required to provide it.

The extension of railroads in the United States during the past three years has been at the rate of more than two thousand miles per annum. This rate will undoubtedly be increased for many years to come. It is for the stockholders to decide whether our lines shall occupy these routes on mutually favorable terms, or whether, by declining to do so, they will invite the formation of rival companies, or the extension of those now in operation, so as to reach and cover the new routes which are and are to be established. But the opening of new territory is not the only field which will invite telegraphic extension and development in the immediate future. The growth of business between the principal cities east of the Mississippi already requires an increase of facilities; and, with the added stimulus of lower rates and a prompter service, this requirement will compel the erection of still more wires on existing routes. The capital invested in one thousand miles of wire, required by the increase of business on existing lines, will generally be returned much sooner than that used for the erection of a like extent of new line. To keep an additional wire in order involves no special increase of cost, as a repair man can traverse his route with about the same rapidity whether the line bears one wire or ten, and a single operator at intermediate stations can often test and operate two or three wires as well as one.

The construction of new lines must necessarily go on so long as the Company aims to control the telegraph business of the country; for if we fail to supply telegraphic facilities as they are demanded they will be furnished by others, and this might result in the creation of a system ultimately rivalling our own. Our true policy, therefore, is to extend our lines as rapidly as they are required; and, while we may regret that a larger share of the profits cannot be divided now, we shall soon perceive the wisdom of the course we are pursuing in the greatly increased value of the property by such extensions.

The time is not distant when we shall receive liberal returns from the large additions now being made to our property and facilities. Our present monthly receipts at offices opened upon lines constructed last year are more than \$10,000; while the aggregate receipts from those built within the past three years, as well as from the new connections established with the Atlantic and Cuba cables, are now at the rate of nearly half a million dollars per annum.

THE aurora borealis or northern light is simply an electric discharge, passing from the polar regions to the equator, through the conducting rarefied air in the upper regions of the atmosphere. As its upper limit is five hundred miles high, it proves that this is the limit of the atmosphere. An absolute vacuum conducts no electricity at all, and the dense, dry, cold air of the lower regions at the poles is a bad conductor; so the electricity accumulating in the upper regions over the poles finds no other way of discharge than through the upper strata of air and the moist, warm air of the tropics.—*Manufacturer and Builder.*

It is from these sources that we expect to make good whatever loss of revenue we sustain by the reduction of rates and the competition of rival companies; and it is believed that the net earnings of the lines which we are now building will, at no distant day, be equal to the annual outlay required for the new construction which will be made necessary by the extension of railroads and the general growth of the business of the country.

WILLIAM ORTON, President.

### Canada.

OTTAWA, Ontario, Sept. 23.—Important dispatches have been received from Lord Granville in reference to the admission of British Columbia to the Confederation of Canada.

Hon. William McDougall, the newly appointed Governor of the Northwest Territory, will leave for his seat of government in about two weeks. Mr. McDougall has made an arrangement with an American company to run a telegraph line to Fort Garry.

### A Frightful Accident.

On Saturday evening, 18th inst., a most deplorable accident occurred at the foot of Ashley street, near the Levee. The elevator office, into which a telegraph wire runs, is being removed, and it was found necessary to remove the wire. For this purpose Mr. John Matthews, who for a long time had been employed by the Western Union Telegraph Company, had been called upon. It became necessary for Mr. Matthews to climb one of the poles which was about 40 feet long, in order to secure the wire. After Mr. M. had cut the wire the pole began to give way. He made a quick descent, but had succeeded in getting down no further than 20 feet, when the pole came to the ground, and the two handles of the large forceps which he held in his hand, just as he came to the ground, were driven with great force directly through his skull, entering the brain about the right eye, and coming out at the top of the head. He died immediately.—*St. Louis Republican*.

### Photographing Magnetic Movements.

(From the Gentleman's Magazine.)

There was a time when the observation of magnetic disturbances in the earth, as exhibited on magnets prepared for the purpose, for the magnetic observatories of Europe was a tediously laborious task. In a magnetic observatory there are employed three needles for the purpose of ascertaining the varying magnitude of the terrestrial magnetic forces in all directions. These needles are steel bars some two feet more or less in length, and thick and broad. One is suspended by a silken skein in the magnetic meridian, and shows by its gentle oscillation the changes in the *declination* or compass bearing. Another is partially restrained by two silken suspending cords in a position at right angles to the former, and its movements, in opposition to the ties show the continual changes in the earth's *horizontal* magnetic force. A third is nicely balanced on knife edges like a scale beam; its stately vibrations exhibit the varying intensity of the earth's force in a vertical direction. Usually, these needles, although in constant motion, do not twist more than about half a degree per day. Thunders may roll and lightnings may flash above them, yet they take no heed, but let an Auroral glimmer show itself; let the "merry maidens" disport themselves even out of sight of the magnet watcher, and then will the needles run wild. Like frightened things they quiver and shake and wander fitfully and far beyond their usual bounds of oscillation.

These magnets carried small mirrors attached to suspension fibres and graduated scales were fixed at a distance and observed in mirrors by telescopes. Hour after hour the eye of the watcher was enslaved alternately reading the scale indications of the three needles. It was hard work counting clock beats through the long night, and minute by minute peering at and jotting down the reflected oscillations of a compass needle.

*Mais nous avons change tout cela.* Photography is now the observer. By fixing a concave mirror to the magnet, a spot of light from a neighboring gas flame is formed at a short distance from the reflector, and every tiny twist of the bar is rendered visible by a displacement of the light spot. If then a sensitive sheet of paper be placed to receive the spot, and made by clock work to travel slowly in a direction traverse to that of the magnet's swing, it will be impressed at every instant with the shifting beam, and there will be produced a wavy or zigzag line, which will be, in effect, the *trail* of the magnet.

Thus do the three needles of a modern observatory perpetually observe themselves. Every day sheets of paper are set before them and removed on the mirror, bearing the unerring record of their twenty-four hours' watch. When the great Aurora has shown itself, the traces are very beautiful. Now, the line will bend into a gentle curve, then it will be jagged as a saw; anon it will fly away to right or to left for a few minutes forming the outline of a graceful spur; presently it will make an excursion beyond the limits of the sheet and not return for an hour or more. The three needles keep step to some extent with one another, each showing the action in that particular direction in which it is constrained to move.

### Power of Spiders' Silk.

A bar of iron 1 inch in diameter will sustain a weight of 28 tons, a bar of steel 50 tons; and, according to computation, based upon the fact that a fibre only 1-4000th of an inch in diameter will sustain 54 grains, a bar of spiders' silk an inch in diameter would support a weight of 74 tons.

### The West India and Panama Telegraph Company.

It is now exactly two years since the laying of the first Cuba cable, that a company has been brought out for the extension of telegraphy through the West India Islands and to Panama, and it is announced that "the company is formed for the purpose of extending telegraphic communication throughout the West India Colonies, and, at the same time, of forming the central link of the telegraph communication of Brazil, Peru, Chili, Buenos Ayres and the other States of South America, with London, New York, and the whole continent of Europe and North America."

The extension of lines thus prepared will consist of 2,550 miles of submarine cable and 350 miles of laid line, and "will commence at the Island of Cuba, and be continued through the West India Islands to the continent of South America, with a branch cable to Panama." Concessions have been obtained for a period of forty years for establishing and working telegraph lines from Havana through Cuba, to Porto Rico, Mexico and Panama, and from Porto Rico to the continent of South America, through the chain of the West India Islands; and important rights, including subsidies estimated at £14,000 per annum, have been obtained from the Colonial Governments of Jamaica, St. Thomas, Barbadoes, Trinidad, Demerara, &c. The proposed route of the line will be a land line through Cuba from Havana, the terminus of the American cable, to the coast, from whence a cable will be laid to Jamaica. This island will become an important point, for from thence a cable will be laid to Aspinwall in Panama, and another to Porto Rico, thence to St. Thomas, Barbadoes and Trinidad, to Surinam, on the north coast of the South American continent. The longest of these cable sections will be 600 miles.

Negotiations are in progress for the extension of the telegraphic communication to Peru, Chili and the Argentine Confederation, and "the Brazilian Government are also taking active steps for the extension of the line from Surinam to Rio Janeiro, with stations at Bahia, Pernambuco and other parts in the route, by which means the company will be in connection with lines now completed, or in course of completion, from Rio to Buenos Ayres, Montevideo and Valparaiso." The capital of the company is £650,000 in £10 shares, and a contract has been entered into with the India Rubber, Gutta Percha and Telegraph Works Company for the sum of £587,000 to make and lay the submarine cable. This cable will be of the best quality, of the same class as the Cuba-Florida cable.

The cables are to be constructed within eight and to be submerged within eleven months. Telegraphic extension is largely on the increase in South America, and where, by inserting the middle link in the chain of telegraphic communication by establishing these West India cables, uniting telegraphically with South America, we may expect a very large amount of business.—*Mechanics' Magazine*.

### Mercury Mines of Almaden.

M. Jouglet.—Mercury, as metal, has been known from the most remote antiquity—that there have been mines worked for mercury ore in Asia Minor in the time of Xenophon; the mines of Almaden, Spain, is yet the largest source of mercury for Europe. The cost of 100 kilos. of the ore is, everything included, only 16 francs and 10 centimes; but it yields, as this author says, by unsuitable management, only 6.9 per cent. of mercury, 100 kilos. of which cost, on the spot, 141 francs and 30 centimes; but at Seville the price is already 177 francs and 80 centimes, in consequence of cost of transport and the iron vessels in which the metal is carried. The average quantity of mercury produced annually amounts to about fifteen and a half tons, by weight.

**Brazilian Telegraphy.****PETROPOLIS LINE.**

This line is eight leagues long and cost \$1,000 the mile. Its stations are Rio, Raiz da Serra and Petropolis. Its receipts are about \$4,200 annually.

**CAPE FRIO LINE.**

This line connects Rio and the Cape, with intermediate stations at Itaipu and Ponta Negra. Its length is twenty-four leagues and it cost about \$970 per mile. Its receipts in 1867 were about \$3,200. It is now extending to Campos.

**SOUTHERN LINE.**

This line connects Rio and Rio Grande do Sul with intermediate stations at Itaguahy, Mangaratiba, Angra dos Reis, Paraty, Ubatuba, S. Sebastiao, Santos, Iguape, Paranagua, S. Francisco do Sul, Itajahy, Desterro, Laguna, Torres, Conceicao do Arroio, Porto Alegre and Rio Grande.

Its length is 230 leagues, and it cost about \$1,800 the mile.

The submerged parts of the line took 24,783 metres of cable, the greater part of which had to be relaid in consequence of the cable furnished by Siemens & Alake rapidly losing its insulation.

Dr. Capanema estimates the conservation of the Brazilian lines at \$10 the league, that of English lines being \$14. The Brazilian lines, however, are rarely in working order.

**THE BALLESTRINI CONCESSION.**

The concession of 1864 having lapsed, the government has accepted the modifications entered into between Ballestrini and the French government, namely:

Renunciation of subsidy.

Reduction of term, from 99 to 60 years.

Renunciation of the provincial intercommunication from S. Roque to Para.

The first section connecting S. Roque and the Antilles, to be finished in three years.

That from Lisbon to Cadiz to be begun in three years and finished within five.

Beside the Ballestrini project for connecting Brazil with Europe, whose concession devolved March 22d last, and for which negotiations for renewal are pending, the principal projects before the government are:

That of the Associacao Commercial Beneficente of Pernambuco, for a line between Recife and Rio, under the conditions of the law of September 28, 1853, which authorizes a government guarantee of five per cent. on such a line.

That of Antonio de Lacerda and Joaquim Elizio Pereira Marinho, of Bahia, for a line from Para to Rio, without subsidy or guarantee.

That of Mr. Figanieri of New York, for a line joining Brazil with the United States and Europe, in consideration of a subsidy.

That of the International Company of Ocean Telegraphs, to join Brazil and the United States. Terms not filed.

That of Sir Charles Bright, Marcoatu, Webb, Jones and Kieffer, to connect the coast of Brazil with Europe and the United States, with no subsidy. The same project also includes that of the coast line between Rio and Para. This project was favored by the Council of State.

That of Luiz Joaquim Pereira Caldas, for a line from Cape Frio to Rio Grande do Norte and thence to Europe, with a guarantee of five per cent.

That of Messrs. Ad. Sainctelette, F. de la Hault and D. Hudson, of Brussels, for a line between Brazil and Europe, on the basis of a minimum guarantee of interest.

From Sr. Manuel da Cunha Galvao's exposition.

**The Electro-Deposition of Iron.**

In the Chemical Section of the British Association, Dr. Jacobi, so well known as the earliest worker in the field of electro-metallurgy, read a paper "*On the Electro-Deposition of Iron.*"

A very low battery power was employed—usually two small Smee's elements.

The moulds may be gutta-perch, wax, or in fact, any material with which the electro-metallurgist is familiar.

*Nature of the Deposit.*—The iron has a beautiful lustre, and a silky texture. Exact experiments on its conductivity and tensile strength have yet to be made.

*Employment of the Electro-Iron in the Arts.*—Dr. Jacobi showed specimens of great beauty of iron so deposited. Examples of mediæval art of extreme intricacy may be faithfully reproduced; the tone of the metal being well adapted for a purpose of such interest.

In addition to the above there were many stereotypical types. Examples of the process of heliography were illustrated by impressions taken from electro-deposited iron plates. To this process the form of metal is singularly applicable.

The patent rights have been secured; and the extreme importance of the process in a commercial point of view cannot be too strongly insisted upon.

In conclusion, we may mention the result of some curious experiments given by Dr. Jacobi:

A rod of wax was first coated with a thin film of copper, and on this the iron was deposited; The rod was surrounded by a helix of copper wire, through which a current of electricity was passed. The deposit of iron produced was magnetic, and the metal was deposited in fine fibres at the poles, the tube being of a fine, close texture. The fine particles of iron followed the lines of the magnetic curve.

**A Valuable Hint.**

EDITOR JOURNAL OF THE TELEGRAPH:

I have a few suggestions and a few questions for you:

*First.*—That all main circuit-magnets now in use be at once tested, to see if the local circuit attachment thereto has any electrical connection with the main circuit. This could soon be done by one person in each district.

*Second.*—That no relays be taken from the shops until the same test has been made and it is found that no such connection exists.

*Further.*—The instrument should be so constructed that this might not easily be made or happen, by contiguity or the loose fine wires about a relay getting out of place.

*Reason.*—That in all, except the large first class offices, local batteries are not thoroughly insulated from the ground, and in many offices there is a constant escape via the local wires to the ground, or to other wires via the same. I have seen in 14 years a large number of such instances, and the amount of trouble they caused was not slight, especially in damp weather. If you could know the situation of every local battery in the country, and also know the number of relays in which the fault really exists, you would comprehend the utility of the suggestion as I mean it.

O. R.

[Our correspondent adds "a dig in our ribs," which we wish was only in ours. Were it so we would endeavor to see corrected. It seems scarcely prudent to explain what that "dig is," but we may assure him that attention will be drawn to it without any use of his name.

**Enormous Exhibition of Power.**

We clip the following interesting item from the columns of *The Country Gentleman*:

"A paragraph has been recently going the rounds of the press, in which it is stated that the greatest blast on record was recently made on the proposed site of a fort in San Francisco harbor. Twelve tons of powder were fired at once, dislodging 80,000 tons of rock. So far as the quantity of powder exploded is concerned, this is probably true, at least in regard to ordinary blasting and mining operations; much larger quantities of powder have been exploded accidentally and in military operations. The greatest exhibition of power of which we have any knowledge was the blast at the Round-Down cliff at Dover, England, January 26th, 1843. The cliff was 375 feet above high water mark, and as a projection of it prevented a direct line of the Southeastern Railroad being taken to the mouth of the Shakespeare Tunnel, it was resolved to remove the obstruction by blasting. Three galleries, 300 feet long, were excavated in the chalk rock. Nine tons of powder were placed in the bottom of the shafts, arranged in three separate charges, which were fired simultaneously by means of powerful voltaic batteries. As soon as the current was sent through the wires, a low, faint, indescribable subterranean rumble was heard, and, immediately after, the bottom of the cliff began to bulge out, and then, almost immediately, about 500 feet in breadth of the summit began gradually but rapidly to sink. There was no roaring explosion, no bursting out of fire, no violent and crashing splitting of rocks, and, comparatively speaking, but very little smoke. For a proceeding of mighty and irrepressible force, it had little or nothing of the appearance of force. The rock seemed as if it had exchanged its solid for a fluid nature, for it glided like a stream into the sea, which was at the distance of one hundred yards from its base. By this blast one million tons of rock were removed, which would otherwise have required the labor of thousands of men for upward of twelve months."

SEVERAL requests have been made for the JOURNAL, No. 16. No such number has been issued. By some oversight No. 12 was numbered 11, and the error was perpetuated up to 15. By omitting No. 16 the error was arrested and the numbering rectified. The dates are correct.

A new, light cable, costing £450,000, is proposed to be laid between Ireland and Nova Scotia. We may expect now a flood of all such projects.

On the railroads in France electricity is taking the place of human watchfulness. On many lines there are contrivances where the passing of a train is automatically announced to neighboring stations. The cars pass over connecting wires, and the train records itself before and behind, so that its progress and appearance are alike indicated.

**Limit of Magnetization of Iron and Steel.**

M. Waltenhofen.—The result of the author's researches on this subject are, that the magnetic moment of the unit of weight of iron may attain a certain limit which is constant and independent of the form and dimensions of the electro-magnet. The absolute value is about 2,100 absolute units, expressed in milligrammes. The limit of magnetization which soft iron can temporarily attain is about five times greater than the permanent magnetism obtained with steel bars, which rarely exceeds 400 units to the milligramme.

## Electrical Tension Mathematically Considered.

MR. PRESCOTT REVIEWED.

NEW YORK, September 17, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

In Mr. Prescott's reply to my last article in your columns, I have as yet failed to meet with any argument disproving the position taken by me in reference to the distribution of the tensions in a voltaic circuit. He says that "if the theory of electric transmission is to be established, not by weight of evidence, but by an array of authorities," that he would rather rely upon the opinions of some of the more eminent electricians, such as Faraday, Tyndall, Grove, Muller or De la Rive. But I cannot see that the extracts he brings forward from these authors, are in any manner inconsistent with my views in regard to tension as given in a former article in the JOURNAL. I made use of the illustration of the reservoirs of water and the pipe, merely to show that electrical force, like all other forces in nature, results from a disturbance of equilibrium. I said nothing about its being a case of tension, and I see no occasion for a misapprehension of my intent in employing it.

In a discussion like the present one, Mr. Prescott's play upon words in regard to the definition of the term zero, will hardly pass muster as an argument. I think it may be demonstrated beyond a doubt, that my original assertion is correct, and by "the weight of evidence" alone, without the assistance of "an array of authorities" other than facts will justify.

I will take Ohm's formula as a point of departure, as I believe all electricians, including Mr. Prescott, acknowledge its truth, which has been abundantly verified by experiment. This formula may be stated thus:

Let  $S$  = the value of the current or its power to produce effects.

= the electro-motive force of a single element of the battery employed.

Let  $R$  = the internal resistance of a single element.

Let  $n$  = the number of elements.

Let  $r$  = the resistance of the circuit exterior to the battery.

Then,

$$S = \frac{n E}{n R + r}$$

Or, in other words, the effective strength of current in any voltaic circuit is equal to the sum of the electro-motive forces divided by the sum of the resistances.

This relation may be accurately represented to the eye by a geometrical diagram projected upon a principle similar to that usually employed in the construction of railway time tables. It is obvious that the rate of speed in a railway train may be found by dividing the distance traveled over by the time of transit. Therefore, if a horizontal line be divided by a scale of equal parts representing miles, and another line drawn perpendicular to this representing hours and their subdivisions, the angle of inclination of the hypotenuse of a triangle the base of which corresponds to the distance and the side to the time, will accurately represent the rate at which any given train travels, for the greater the speed of the train the greater will be the angle of the hypotenuse.

This method of geometrical projection being based on mathematical reasoning, may be employed with equal propriety to represent the tensions and electro-motive forces of a voltaic circuit, as the formula in the two cases are identical. Its application to this purpose was pointed out a number of years since by Mr. F. C. Webb. This principle of representation may be illustrated as follows: "Let all the parts of a circuit, whether liquid or solid, be expressed in their success-

ive order by portions of a continuous horizontal line, which shall be to one another as the reduced lengths or resistances of those parts. "Let the tension at any point in the circuit be represented by the perpendicular height of a point above or depth below the horizontal line representing the resistances." This when above the line will indicate a positive, and when below, a negative tension. The horizontal line of resistances may be termed the axis.

In order to represent the tension at every point in the circuit, we must construct a line termed the "line of tension." The perpendicular height of this line above the axis at any point, indicates a corresponding positive tension at that point, and its depth below in the same manner indicates a negative tension. When this line crosses the axis, the point of intersection has no tension.

"Electro-motive force consists in a sudden and constant difference in the tension of the points situated immediately on opposite sides of the surface of junction, between the positive (zinc) element and the liquid. The electro-motive forces in the circuit must therefore be represented by a sudden rise in the line of tension at the points along the axis at which they occur, thus forming lines perpendicular to the axis. The magnitude of these lines must be proportional to the electro-motive forces they represent. Moreover, as the electro-motive force is a quantity depending solely on the nature of the elements at the surface of junction of which it occurs, and not at all on any change in the resistance or electrical state of the

circuit, these perpendicular lines constantly maintain the same magnitude, although their position as regards the axis may be altered in various ways."

Now let us construct a figure which shall correctly represent the electro-motive forces, tensions, resistances and strength of current on a telegraph line with a closed circuit, having a battery of three cells at each end of the line, which will be a sufficient number to illustrate the principle of the American system of working.

Let the horizontal line  $N P'$  (see figure) represent the axis or line of resistances, the latter being represented in their respective order, beginning at the point of contact,  $N$ , between the extreme zinc plate of the battery, and the liquid of the cell.  $N B$ ,  $B C$  and  $C P$  represent the respective internal resistances of the three battery cells, and  $N P$  that of the entire battery. Let  $P H N'$  represent the resistance of the line wire and  $N' P'$  that of the battery at the opposite end of the line. Erect a perpendicular,  $N E$ , at the point  $N$  and divide into three portions,  $N F$ ,  $F G$  and  $G E$ , which shall be to each other as the electro-motive forces at  $N$ ,  $B$  and  $C$ . The other battery  $N'$ ,  $P'$ , having its negative pole,  $N'$ , to the line, will give a negative tension, therefore, a perpendicular,  $P' E'$ , let fall below the axis from the point  $P'$ , and divided in the same manner will represent the electro-motive forces of the battery  $N' P'$ . Therefore the line,  $N P'$ , represents the sum of the resistances, and  $N E + P' E'$  the sum of the electro-motive forces. It necessarily

follows, that the line of tension,  $M H M'$ , which we get by joining  $E$  and  $E'$ , varies in the angle of its inclination to the axis according to the proportion between the sum of the electro-motive forces,  $N E$  and  $P' E'$ , and the sum of the resistances  $N P$ , and the degree of its inclination will therefore accurately represent the effective working strength of the current in all parts of the circuit.

In order to correctly represent the varying tensions within the battery, we will proceed as follows. Having joined  $E$  and  $E'$  erect perpendiculars at  $B$ ,  $C$  and  $P$ . Now as the effective strength of the current represented by the inclination of the line  $E E'$  is the same at every point of the circuit, draw  $F I$  parallel to  $E E'$ . Then  $F I$  will be the line of tension in the first cell, falling regularly through the resistance of the liquid to the surface of generation,  $B$ , of the second zinc, where it rises suddenly to an extent corresponding to the electro-motive force there situated. Draw  $G K$  parallel to  $E E'$  intersecting  $B O$  at  $J$ .  $I J$  will then be equal to  $F G$ , which represents the electro-motive force at  $B$ , and  $J K$  will be the line of tension in the second cell. Now as  $G K$  is parallel to  $E E'$ ,  $K L$  will be equal to  $G E$ , the electro-motive force at  $C$ , and  $L M$  will be the line of tension in the third cell. In the same manner we may construct the line of tension within the other battery,  $N' P'$ .

Now the points  $N$  and  $P'$  being connected directly with the earth, whose resistance is infinitely small, their tension will be the same, and equal to that of the earth, which is assumed to be zero, that is, neither positive or negative. It is manifest that at the point  $H$ , midway of the circuits where the line of tension crosses the axis, the tension is the same as that of the earth, which is zero.

Mr. Varley's diagram, which is constructed upon the above principle, therefore shows not merely the "strength of current in different parts of the circuit," as Mr. Prescott asserts, but also the distribution of tensions throughout the circuit, as I stated in my previous article. I have illustrated the line in a condition of perfect insulation. In representing the electrical condition of a leaky line,

as in Mr. Varley's diagram, the line of tension  $M H M'$  forms a double catenary curve, the angle of inclination to the axis constantly increasing from  $H$  to  $M$  and  $M'$ , because in a leaky line the current continually increases in strength in each direction from the neutral point to the battery poles at  $P$  and  $N'$ .

Mr. Webb has demonstrated the correctness of the above method of geometrical projection, by applying Ohm's formula for obtaining the tension at any point in the circuit. The results are found to correspond in each case. This formula may be stated as follows:

Let  $T$  = The tension at any given point of the circuit  $X$ .

$Y$  = The abscissa of that point  $X$ , taking as origin the point of least tension.

$A$  = The sum of the electro-motive forces.

$L$  = The reduced length or resistance of the entire circuit.

$O$  = The sum of the electro-motive forces included in  $Y$ .

$C$  = The tension of the whole circuit, to external objects. That is to say, the tension of the circuit, if it be an insulated circuit, and electrified by a source not contained within it.

$$\text{Then } T = \frac{A}{L} Y - O + C$$

As in the case under consideration, the earth forms

part of the circuit, the constant  $O$  disappears and the formula becomes

$$T = \frac{A}{L} Y - O$$

Now take a point  $x$  in the diagram, and the tension  $x x'$  will be found to agree with the formula.

The quantities in the formula are thus represented geometrically in the figure :

$$\begin{aligned} A &= NE \\ L &= NH \\ O &= x' x'' \\ Y &= XH \\ T &= x x' \end{aligned}$$

Now, since the triangles  $HNE$  and  $Hxx''$ , are similar, we have  $NH : NE :: Hx : xx''$ .

Consequently  $xx'' = \frac{NE}{NH} Hx$ , and  $JK$  being parallel to  $OL$ , we have  $x'x'' = KL$ .

But  $xx' = xx'' - x'x''$ .

$$\text{Therefore } xx' = \frac{NE}{NH} HX - x'x''$$

$$\text{Or, } T = \frac{A}{L} Y - O$$

If any further proof is required in support of the theory of tensions illustrated above and of the inconsistency of Mr. Prescott's objections thereto, it may readily be obtained by actual experiment. Connect a wire to the earth from the neutral point in the middle of the closed circuit of a telegraph line, and insert a galvanometer or relay. It will be found that no current whatever will pass between the line and the earth, which proves that the electric potential, at that point, is zero, or the same as that of the earth. If such a connection be made at any other point, the current passing will be found to be in exact proportion to the difference of tension between that point and the earth, as found by the above formula. Unless Mr. Prescott is prepared to repudiate Ohm and Euclid, as well as Clark, Varley, Gavaret, & *als.*, I do not see how he can reach a different result from the one I have given above.

This article has reached so great a length, that I will not refer to the remaining portions of his communication, especially as they seem to have no particular bearing upon the points in controversy between him and myself. F. L. POPE.

DISTRICT SUPERINTENDENTS would confer a favor on the editor of the JOURNAL by mailing him, as soon as possible, a complete list of the offices in their District, which are not supplied with the JOURNAL.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR: Has an employe of a telegraph company a right to refuse to receive or deliver messages which he *knows* to be of a dishonest or immoral character?

For instance, not long since a man stepped into our office, called for a blank, and wrote the following message :

"To Mrs. ———, New York :  
"Will be at ——— hotel Tuesday. Can I meet you alone?"

The man was bold enough to make known to me the object of the meeting, which was simply vile.

Now, Mr. Editor, did I have a right to refuse that message, knowing as I did its object, or is the telegraph and its employes bound to lend a helping hand to such base and dishonorable work? M.

[NOTE.—The message quoted could not be refused even with your knowledge of its design. It is utterly impossible to make such discriminations.—Ed.]

APPOINTED.—Mr. Ira D. Rowley, manager, Angola, N. Y., in place of J. M. Newton, who accepts the railroad agency at that place.

## Telegraphers' Mutual Life Insurance Association.

### OBITUARY.

Died of galloping consumption, at the residence of James Galvin, Esq., Edgefield Junction, Tenn., Sunday afternoon, Sept. 12, 1869, John Bohanna, late agent of the New York Associated Press and of the Commercial News Department of the Western Union Telegraph Company at Mobile, Ala., in the 29th year of his age. His remains were buried by the Masonic Fraternity in Mount Olivet Cemetery, at Nashville, Tenn., Tuesday, Sept. 14th.

He was well known to many of the members of our profession throughout the South, having been for the past ten or twelve years an employe on the Telegraph lines in the South. He was what was called a first class operator in every sense of the word, genial, intelligent, industrious and true. S.

## Forwarded Messages.

BUFFALO, September 25th, 1869.

EDITOR JOURNAL OF THE TELEGRAPH :

In your issue of the 15th instant the answer given to the inquiry of Ottumwa, Iowa, office, regarding forwarded messages, in my opinion is incorrect.

By Rule 4 offices are instructed to add in and charge for as a part of the messages, the seven words as shown in the following example:

"BUFFALO, October 8th, 1865.

ROBERT RANKIN, Chicago.

Go to Milwaukee and await orders.

131 & 144 paid.

AMOS BROWN.  
Forwarded from Cleveland, October 9, 1865.

Thus charging for the seven words "Buffalo, October 8th, 1865." The words, "forwarded, &c.," after signature is added simply for convenience in checking the proper office, and should not be counted as a part of the message.

Many of our offices count both date, &c., and words after signature, which is not right. Count only the name of place at which message originates, the day of the month and year.

For your information, showing you that we have not lost any of our zeal in the Company's interests, or fear hard work, the following may be of interest to you. I say beat it who can :

Sept. 8, number of messages sent, - 1649

" " " rec'd, - 1526

Total, - - - - - 8175 messages.

This does not include office messages, repeated messages, or offices with whom we do not number,

Yours truly, N. HUCKER.

[NOTE.—There is an obscurity in the rule in its application to messages originating and forwarded on Western Union lines. The executive officers favor its application to all cases where forwarding has not been caused by neglect of the company, and it may therefore be regarded as of common application. We were misled when we gave the answer in our last number.

### Monopolies.

Frequent complaints are made against the terrible oppressions of the grinding monopolies which are said to be crushing the industry and paralyzing the energies of our people. But it appears that the public do not so regard it. Corporations established to fight these monopolies either starve to death, or are suffered to be gobbled up by the very foes they sought to cripple. The Merchants' Union Express started out with loud professions. It proclaimed its integrity and independence in terms so loud, that the great corporation it said it would crush, suspecting the lack of either virtue, proposed alliance, was accepted, and opposition to monopoly was seen to be but the means to secure a sale thereto. The Atlantic and Pacific Telegraph Company, with less boastfulness, but with as much determination, entered the list against the Western Union. In its case the public have scarcely known of its existence; and now it has been quietly absorbed by the old corporation, at a cost of a little more than one-half its construction expenses, which is probably quite as much as its equipment is worth to the Western Union.

The business public, while slow to move outside of their accustomed channels, are nevertheless ready for anything that gives real promise of remuneration. The two corporations to which we have referred fought against abuses sufficiently aggravated to give them partial success for a time. Why were they not, then, sustained? The companies which they opposed immediately removed the more serious causes of complaint, and the public kept along in the old channel. The new telegraph line did not do a paying business and has collapsed. The Merchants' Union was successful and formed a coalition, which was the very object of its institution. In the case either of success or failure, therefore, it seems impossible to provide adequate protection against monopoly.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, OCTOBER 1, 1869.

### Mirabile Dictu.

The Keokuk convention neither passed a resolution favoring "The Postal Telegraph" nor to the moon for its obumbration of the sun. But this neglect was not for want of will on the part of the postal nurses there present. The *St. Louis Democrat* quotes from the *Gate City* the following stinging criticism on its own absent editor, who was to pilot the resolution of approval:

"Gentlemen had special objects in view to which they gave shadowing importance. The less important usurped the place of the more important. There was unanimity as to the river improvement, but gentlemen only grew earnest upon some other subject. Now it is idle to think that river improvement will succeed unless the people get earnest about that, and give it paramount consideration. If it be made a packhorse for local schemes, or municipal ambitions, or political plottings or individual cupidity, it will soon become a very skeleton project indeed—one that Congress will consign to dishonorable burial 'under the table,' and no help for it. It is worse than idle, it is wrong to call river improvement conventions, and when they are convened to ignore the ostensible work in hand, and make the convention an aid society to the pet fancies or follies of certain gentlemen."

"We hardly know of any proposition made to the convention which more richly deserves these stinging censures than the 'pet fancy or folly' which the editor of the *Gate City* insisted upon admitting, namely: the postal telegraph scheme! Loaded down with such an inconsistency, the report of the committee quickly dwindled down to the report of a minority, and was defeated by the convention."

### "What a Damp Hangs on Me!"

Mr. Gardiner G. Hubbard, the discoverer and proprietor of the so-called "Postal Telegraph System," whose failure to obtain a hearing before the Mississippi Valley Commercial Convention at Keokuk, we reported in our last issue, has reached the Pacific coast. His reception does not appear to have been very enthusiastic, according to the following dispatch:

SAN FRANCISCO, Sept. 22, 1869.

G. G. Hubbard spoke about one hour last night before thirteen members of the Chamber of Commerce and seventeen citizens, not counting three reporters for the press who were present in their professional capacity. After the speech an attempt was made to pass resolutions indorsing the postal telegraph scheme, and calling upon our members of Congress to support it. A quorum not being present the subject was necessarily postponed."

This does not exhibit a very encouraging state of affairs among our trans-continental brethren. The postal philanthropist will be justified in shaking off the dust of his feet as a testimony against the lukewarmness, not to say the frigidity, of the San Fran-

ciscans. We apprehend that the distinguished Telegraph Missionary will discover ere long—if he has not already—that this is not "a bearing year" for new schemes to profit by honeyfugling the public. He has doubtless heard that the "Atlantic and Pacific States Telegraph Company," which he expected to coddle and encourage, has departed this life, having been gobbled up by the Western Union. Upon the heels of this calamity comes the announcement that another corporate structure erected for the amelioration of the telegraphing public in general, and speculative "promoters" in particular—has been struck by the winds of adversity and is tottering to its fall. "The Mississippi Valley Telegraph Company" is reported as being in session at St. Louis, for the purpose of endeavoring to ascertain how to pay \$200,000 indebtedness with property which they are unable to sell for \$100,000, and avoid loss to anybody. Also how to conduct a business whose expenses and receipts are as five of the former to two of the latter, so as to give the capital invested twenty per cent per annum—which is the lowest rate promised by all speculative telegraph engineers except Mr. Hubbard, who asks and promises but ten.

An unsophisticated friend at our elbow, who has been impertinently looking on as we write, breaks in here with the ridiculous query: "How in the world could this young corporation get so much in debt in so short a time?"

### Remarkable Discovery—Very.

REDUCTION OF TELEGRAPH TOLLS.—It seems the Western Union has concluded to reduce the tariff of tolls on telegraphic messages to and from Springfield, Ill. This is all right so far as it goes, but why the reduction is confined to a single Western city does not appear. It savors a good deal of favoritism if the report be correct. The tolls are altogether too high all over the country, and there is plenty of room for further reduction. The Western monopolists, however, will probably never be brought to comprehend the standard of profitable investment in telegraph business until it becomes a part of the postal department of the Government, as in England. The time will, sooner or later, arrive when the Government shall consider whether it will be best for it to purchase the old lines now working or construct new ones, to which may be applied the recent remarkable discoveries in telegraphy.—*Herald*.

It may relieve the *Herald's* anxiety to be informed that a new tariff goes into operation to-day, by which not merely one rate but many thousand are reduced, and also that "the recent remarkable discoveries in telegraphy," about which it is so much exercised, have been known more than twenty years, and have long been used to a limited extent in some European countries, although the greater adaptability of the Morse system is gradually crowding out all others, "the remarkable discovery" included. The *Herald* recently called upon Congress to make an appropriation to test this "remarkable discovery." It will doubtless be gratified to learn that the Western Union Company has already expended a large sum for this purpose, and has a deep interest in its success—being the owner of the only patent which has any demonstrated merit. The *Herald's* disappointment will be great when it learns that although this twenty year old "recent remarkable discovery" produces some interesting results in the way of rapid transmission, they are of no practical value, inasmuch as the time required to prepare messages to be sent and to copy them after they are received, more than offsets the gain in transmission.

Of course the *Herald* does not know that this "remarkable discovery" is simply a new *thimble* under which a "little joker" is snugly ensconced, waiting for the commencement of that irresistible comedy entitled "*Now you see it, and now you don't*." We venture to commend for its consideration the valuable lesson which was taught the boy by the very agreeable gentleman who had an ax to grind. And if inclined to pursue the subject further, that deliciously cool explanation of how to pull chestnuts out of the fire by proxy, as given by *Æsop*, will be found interesting and perhaps instructive.

Is not the *Herald* by its persistent warfare against the Western Union repeating the useless experiment of endeavoring to find nutriment in a *file*?

### Curiosities of the German Franking System.

The privilege of transmitting telegrams free of charge, which is enjoyed by all the reigning princely houses of Germany, will not in future be permitted to so great an extent. In a recent parliamentary discussion on the confederative postal system, the question of abolishing the franking privilege was brought up, when representative Dr. Becker gave the following drastic description of the franking system, especially in relation to the government telegraphs. He said: "The franked telegrams have increased five-fold in the last fourteen years; and to this must be added, the free telegrams are of astonishing length. The military authorities are particularly weak on this point. When, for example, a soldier remains a day over his furlough, the burgomaster of the place where he lives is immediately telegraphed to send him back. That can be submitted to, however, as there is said to be a great national interest at stake; but that for such a telegram sixty-two words should be used is really too much. The franking privilege for telegrams is also enjoyed by the members of the North-German reigning houses and the two Hohenzollern princes. But not only are the telegrams of these people free, but the system is extended to the persons in their retinue and their court establishments. The greatest variety prevails in the contents of these telegrams. When, for instance, the cook of such a prince must have parsley, he immediately telegraphs for it. He marks the telegraphic message with the letter 'S' (the sign for free telegrams), anybody belonging to the court of the prince certifies it, imprints the seal of the house, and then the parsley is requested by telegraph; and most important dispatches in which the public interest is concerned, are often compelled to wait when they happen to come into collision with such messages. So it went one time when the cook of a prince wished to telegraph to a police president on the Rhine to send him a thaler's worth of fish. The telegram bore the official seal of the court kitchen. The same franking system is extended also to the prince's foresters, to the gardeners, to the court theatre, to the princely stables, etc. For instance, if a prince carries on horse-selling during his leisure time, all the telegraphic messages needed go free of charge. If we consider more closely these thousands of free telegrams, we shall find that those really sent in the inter-

est of the state are very few. By a study of the genealogical calendar I have unfortunately only arrived at the letter "L," and find under the word Lippe, sixty princes and princesses, who have all their letters, packets, telegrams and money sent and received free of charge, and of which, for the most part, it cannot be asserted that they are in the public interest."

### Scientific.

A passenger riding on a Western train was hailed by the conductor who demanded his fare. The manner of the conductor had either been startling or the passenger querulous for he answered rather sharply:

"And who are you, pray?"

The conductor answered: "Why, I am Wood, the conductor."

Passenger—"No, you ain't; I know better. Wood is a non-conductor?"

Whether the conductor resigned or not, is not stated.

We had the pleasure of a visit a few days ago from Lord Sackville Cecil, who accompanied the party of experts on the Great Eastern in the laying of the French cable, and who, for several years past, has interested himself in telegraphic matters. After a trip to the Pacific and an examination of our telegraph system, Lord Cecil left on the Cunarder of the 22d for his home in London.

### Atlantic and Pacific Telegraph Company.

The report telegraphed from St. Louis announcing that \$100,000 cash had been offered by the Western Union Telegraph Company and \$225,000 in stock of the Atlantic and Pacific Company for the property of the Mississippi Valley Telegraph Company, is incorrect. No offer what ever has been made. The Atlantic and Pacific Company has 16,000 miles of wire already in operation, and is rapidly extending its lines throughout the United States.—*N. Y. Herald.*

The contradiction of an offer by the Western Union Telegraph Company to purchase the lines in question is correct. The property of the Atlantic & Pacific Telegraph Company, however, does not exceed 3,000 miles of wire, and we can learn of no extension by that company to justify the *Herald's* statement.

### Signalling the Planets.

The latest and most fantastic suggestion in the way of telegraphy is that of a French enthusiast, who, like all inventors and originators of grand ideas, is now being heartily laughed at in Europe for his pains. The old plan with discoverers was to rack or burn them; the new plan is to cover them with ridicule. Perhaps in this case such punishment is not ill-deserved. Our enthusiast's proposal is, not to fly to the moon, but communicate with the planets. He wishes to mount a gigantic mirror, capable of being readily moved, and to give flashing signals to Jupiter or Venus. His theory is, that if these are repeated regularly at given intervals and in equal numbers of times, the inhabitants of the planets will come to discern them, to understand that they mean something and to return them. Should they do this, a code of signals could manifestly, without much difficulty, be devised. The proposer of this curious scheme points out that even now bright spots are occasionally seen on some of the planets, and suggests that they may possibly be similar signals from the inhabitants of those orbs to each other and to us. The idea is said to have been discussed before now, and to have been abandoned; but, however impracticable or absurd, it has been thought worthy of serious attention by the French Academy of Sciences.

NEARLY 15,000 messages passed through the Central New York office of the Western Union Telegraph Company on the day of the gold panic, Friday, Sept. 24th.

## TARIFF BUREAU.

### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
OCTOBER 1, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since September 15th, the date of the last tariff order. Please note them in your tariff book:

#### NEW OFFICES.

To be entered in Part 1., new Tariff Book.

21 Atkinson, N. H.	74 Lamsons, N. Y.
426 Altoona, Iowa.	* Lanesboro, Minn.
59 Avondale, Pa.	* Lynchburg, O.
131 Alladin, Pa.	* Montgomery, N. Y.
82 Alexandria Bay, N. Y.	384 Magnolia, Miss.
11 Burnham, Me.	349 Marble Hill, Mo.
36 Berkshire, Mass.	488 Martin, Texas.
436 Corning, Iowa.	21 Newton, N. H.
387 Chelsea, Iowa.	241 New Haven, Ind.
* Campbell Hall, N. Y.	41 Norwood, N. J.
* Clintonville, N. Y.	41 Nyack, N. Y.
* Coal City, Pa.	406 Osage, Iowa.
486 Courtney, Tex.	447 Olathe, Mo.
17 East Kingston, N. H.	385 Raceland, La.
426 East Des Moines, Iowa.	17 Rollinsford, N. H.
* Elizabethtown, N. Y.	307 Rose Hill, Ill.
406 Floyd, Iowa.	426 Stuart, Iowa.
* Frankfort, Ohio.	* Shawangunk, N. Y.
Fort Benton, Montana,	455 Villisca, Iowa.
500 more than Omaha,	140 Waterloo, Pa. (P. O. add
Neb.	Polk, Pa.)
12 Harwich, Mass.	455 Watson, Mo.
66 Hazleton, Pa.	* Walden, N. Y.
488 Hearne Station, Tex.	* Waverly, Va.
131 Indiana, Pa.	* Wilsboro, N. Y.
* Ivor, Va.	

#### NEW OFFICES ON OTHER LINES.

To be entered in Part II.

Tariff for  
other lines. Leaves this line.

Campbell Hall, N. Y., 25 and 2 more than to Goshen, N.Y.		
"Leaves this line" at same point as Goshen.		
Coal City, Pa.	40 3	Oil City, Pa.
Frankfort, O., tariff, and point where business "leaves this line," same as Greenfield, O.		
Lynchburg, O., tariff and "leaves this line" same as Hillsboro, O.		
Ivor Va.	50 5	Petersburg, Va.
Montgomery, N. Y. Same as Campbell Hall, N. Y.		
Shawangunk, N. Y. Same as Campbell Hall, N. Y.		
Walden, N. Y. Same as Campbell Hall, N. Y.		
Waverly, Va.	50 5	Petersburg, Va.
Lanesboro, Minn., 50 and 3 more than to Lacrosse. "Leaves this line," same point as Lacrosse, Wis.		
Wilsboro, N. Y., Elizabethtown, N. Y., Clintonville, N. Y.,		
Tariff and "leaves this line" same as Plattsburg, N. Y.		

Buckingham, Que.,  
Carillon, Que.,  
Gatineau Point, Que.,  
Lachute, Que.,  
Papineauville, Que.,  
St. Eustache, Que.,  
St. Scholastique, Que.,  
St. Andrews, Que.,  
Thurso, Que.,

Tariff and point where business "leaves this line" is the same as Hudson, Que.

#### OFFICES CLOSED.

Amelia, C. H., Va.	Drakes Branch, Va.
Barton, Md.	Ft. Bridger, Utah.
Baldwin's Station, Pa.	Grand Island, Neb.
Bently Springs, Md.	Granger, Utah.
Clarendon, Vt.	Greensboro, Ga.
Creason Springs, Pa.	Kingston Springs, Tenn.
Cornwall, N. Y.	Malden, Mass.
Caldwell, Lake George, N. Y.	Montgomery W. S. Springs, Va.
Cozzens' Hotel, West Point, N. Y.	Ringgold, Va.
	Ruffins, N. C.
	Sharon Springs, N. Y.

#### GENERAL INFORMATION.

The name of the office heretofore known as Sanbornton Bridge, N. H., has been changed to Tilton, N. H., and Porter's Station, Mass., to North Cambridge, Mass.

There is no office at Beaufort, N. C. Messages are delivered from Moorehead City. Charges, 25c.

The tariff to Hudson City, N. J., will hereafter be obtained by the new system, its square number is 41. Check direct.

The tariff to square 500 is 10c. more than square 488.

Those offices whose books give tariff to Eddyville, N. Y., 36 and 2, Bondout, will change the tariff to 25 and 2.

Offices in Districts I, K and L, will make tariff in Part II as follows:

To Archbald, Pa., 20 and 2 Scranton, Pa.
To Olyphant, Pa., 20 and 2 Scranton, Pa.
To Providence, Pa., 20 and 2 Scranton, Pa.

Annapolis, Md., square 77 is an other line office, tariff 25 and 1 from Washington. Check Washington.

Offices in the following squares will change the rates on their tariff sheets to agree with rates here given:

Tariff between SQUARE 297 and—

Square 12....2.45	Square 139....1.40
18....2.35	179....1.30
25....2.20	189....1.20
32....2.10	200....1.10
40....2.00	220....1.00
51....1.85	230....1.00
65....1.75	240.... .85
83....1.60	250.... .85
101....1.50	260.... .75
120....1.50	269.... .75

Tariff between SQUARE 306 and—

Square 230.... 1.00	Square 250.... .85
	Square 269.... .75

#### TO OFFICES "HAVING SPECIAL SHEET A."

On and after Oct. 1st, tariff to Hazleton, Pa., new office, will be 35c from all offices between Philadelphia and Scranton, and 35c. more than "special rate" to Philadelphia from all others.

WILLIAM ORTON, President.

### • Money Cyphers.

The transmission of messages by telegraph, directing the payment of money has always been done with hesitation. The ease with which an amount can be changed, the possible presentation of the order by improper parties, the opportunity given to persons connected with the telegraph itself to make use of information thus obtained, have operated to discourage the use of the telegraph for this purpose. Yet it is largely done because of the frequent occurring necessities which call for its use. The maturing of notes at distant places, the impecuniosity of travelers whose purses have become exhausted, the purchase of goods and property, the possibility of which depends on obtaining money at once from distant parties, all compel resort to the telegraph, and almost invariably without betrayal of the trust thus reposed.

Where parties are under the necessity of frequent recourse to this mode of transacting business, the simple use of an initiatory word to identify the message is, in most cases, deemed all that is necessary for protection. Thus, a message written as follows, secures attention, and is usually acted upon without hesitation :

BRADLEY & BROTHERS, St. Louis :

Intercede protect note of Marion  
and Gill, due to-day, ten thousand dollars.

JOSHUA STURGIS.

The word "intercede" shows the message to be genuine, that being the key between the parties for that day. There is still, however, a great want of something simple and complete to meet the very frequent occasions for transmitting money in this way.

One of the English telegraph companies has been in the habit, for many years, of transmitting money in amounts of any size, by the employment of a cypher or key which has never yet failed, and by which a large revenue has been derived. We will try to illustrate how it is done.

A party in London who desires to have the sum of £4,510. 0. 0. paid to a party in New York, first deposits with the bankers of the telegraph company the amount, and receives evidence thereof. An insured or repeated message is then sent by the banker to the telegraph company, at the place where payment is to be made, to pay £4,510 to the party named. To this message the telegraph company attaches the amount stated in code or cypher, thus :

D M R R X L.

A message is then sent to the party to apply for the money, when it is at once paid, the charge being the cost of two messages and one-half per cent. on the amount, half of which goes to the telegraph company, and half to the bankers.

The key is arranged as follows :

Two parties have each a book on each leaf of which there is a double paging. Thus the first page may be

B. K.

The second—

O. M.

and so on, each page varying from the other.

Columns of letters are thus arranged, *ad libitum*,

corresponding with the number of figures likely to be needed in something like the following manner :

PAGE.	NO. OF FIGURE.	FIG. 1.	FIG. 2.	FIG. 3.	FIG. 4.	PAGE.
M	1	T	L	R	E	T
I	2	A	I	O	T	E
N	3	B	C	L	A	B
O	4	M	K	U	I	M
R	5	O	R	C	N	A
D	6	N	A	F	D	L
A	7	D	M	P	S	G
Y	8	Y	J	B	K	O
L	9	G	F	V	Q	N
S	0	B	V	W	X	U

By referring to the cypher it will be seen that the first and last letters indicate the page D—L. The second letter M, is found on the fourth line, and therefore represents 4. R on the 5th line indicates 5. R in the third column 1st line indicates 1. X on the fourth column last line indicates O. As these tables admit of infinite variety, the check may be regarded as complete. The payment of an improper sum is prevented and all that is necessary is to properly identify the parties, when the amount is paid by check on bank where identification is again required. Thus by the mutual work of the bank and the telegraph a large and useful and profitable business is transacted.

### Tariff Questions.

As might have been expected in the adoption of a system utterly new, and superseding one having certain specific applications which are necessarily retained, some perplexity exists as to the meaning of directions given, however plain these directions really are. Some inquiries will necessarily come to us, and which we invite, which we propose to state as they are received, giving such answers thereto as may be necessary, and which will be regarded as the opinion and direction of the Tariff Bureau.

Q. 1. Are we to have any *through* rates? No.

Q. 2. Are the special rates to be continued after the adoption of the new system?

Ans. By the tariff circular issued in the JOURNAL of September 1, directions are given to continue all special rates which are *lower* than by the new system. Such you will understand as the directions of the Tariff Bureau now.

Q. 3. When I find my rate by the new tariff is higher than my present rate, which am I to use?

Ans. The order in JOURNAL, 1st September, covers this ground, but to prevent error we repeat that the NEW TARIFF RATES ARE ONLY TO BE USED WHEN THEY ARE THE SAME OR LOWER THAN PRESENT RATES.

Q. 4. How are we to arrange with points like Owego and Elmira, to which Auburn, for example, has a direct wire and which is checked direct, and yet which are classified in the new book as on "other lines?"

Ans. In such a case you will apply to your superintendent, who will instruct you in reference thereto.

Q. 5. Points within 25, 50 and 75 miles are all made 35 cents. Shall we regulate these tariffs according to the last JOURNAL?

Ans. The rate for 75 miles' offices in Districts B, C, D, E, F, G and H is as follows :

25 miles and under—25 and 2.

50 miles and over 25—30 and 2.

75 miles and over 50—35 and 2.

You are expected to ascertain what offices are within 75 miles of your office, divided as above, and enter the tariffs to them on the scale given.

Offices in Districts J, K, L, M and O will charge 35, 45 and 55 cents for the above distances, respectively.

Q. 6. Suppose I am notified that a new office has been opened at A and I am to make the tariff so much more than to B. There is no rival line to A but there is to B, and the consequence is my tariff is far less by this order than to other places in the immediate vicinity of A where there is also no rival line. Should I not use the tariff to B as it was before the special rate was issued?

Ans. Yes. Should there, however, be much business to A, it would be your duty to inform your superintendent, who would appeal to the Tariff Bureau for directions. The special rate to B will, in most cases, be authorized.

Q. 7. An office is opened on "other lines." I am to make rate so much from C—check C. I formerly had a "through" rate to C, and now have a "local" rate to C which is far less than the "through" rate was. This low "local" rate is my "special sheet" rate. All other rates have been obliterated while the old "through rate" ought to be used supposing there to be no rival line to this new office. By this the Company loses from ten to fifty per cent. of the just rate to such new office.

Ans. JOURNAL, Dec. 1, 1868, directs offices to report all apparent inconsistencies to their superintendent. JOURNAL, Dec. 15, 1868, directs as follows :

On and after December 21st, all offices having "Special Sheet A" when computing tariff on business going to "Other Lines" will add their "special rate," to the point where the message leaves the Western Union lines, to the rates for "Other Lines," provided the "special rate" is not more than the old "through rate."

Q. 8. A new office is opened on this line. I am told to make out rate same as to D. Now to D I have a very low special rate. The old rates are rubbed out. By using said rate to D I send a message for such point from ten to fifty per cent. less than to other offices which, like this new place, has no rival line, and are in its immediate vicinity. Is this designed?

Ans. By referring to the JOURNAL, June 1, 1868, the following order will be found, and is still in force :

When notice of a new office is given, and you are directed to make tariff same as to an office to which there is a "special rate," the special rate to that office is not to be used as the rate to the new office, unless so stated. The rate to be used will be the rate in force before the "special rate" was made.

EDITOR JOURNAL OF THE TELEGRAPH:

Allow me to ask your opinion on the following point: If, after reasonable time has been given, a manager is unable to collect from a customer charges due for transmission, could the manager legally refuse until such charges are paid, to transmit said customer's messages, or to deliver to him "collect" telegrams.

H.

ANSWER.—No message can be detained because of the non-payment of another.

**Forwarded Messages.**

On an examination of Rule 4, it has been decided that its application will affect all forwarded messages. Whenever, therefore, any message is, by request, forwarded, bearing a date other than the place from which it is last sent, that other date will be charged. The following is the rule:

"In case a person (having received a message) requests the same to be forwarded to any other office, in all such cases require prepayment, and in estimating the amount to be paid, include, as a part of the message, the name of the place where it originated and the date, as the same appears on the message."

Offices in doubt as to questions of this nature or others affecting their official duties, should refer them to their superintendents, who are better able to give satisfactory answers, and who alone should give them.

**Fire Alarm Telegraphs.**

Various systems of Fire Alarm Telegraphs have been introduced to public acceptance, each of which has had some point of excellence claimed for it which was to render it the acknowledged superior of all others. Experience, that good old teacher, at which school we all have to graduate some time or other, has of late years given precedence to that of GAMEWELL & Co., and it has been adopted by the following cities, the magistracy of each of which have testified to its merits in the most unreserved manner:

Boston,	Chicago,
Philadelphia,	Cincinnati,
St. Louis,	Buffalo,
Baltimore,	Mobile,
New Orleans,	Pittsburg,
Louisville,	Allegheny,
Montreal,	Quebec,
Portland,	St. John, N. B.,
Hartford,	Troy,
New Haven,	Rochester,
Springfield,	Toledo,
Albany,	Columbus,
Lawrence,	Milwaukee,
San Francisco,	Cambridge,
	Washington.

The chief engineer of Boston says: "*Every year adds to our confidence in its utility and efficiency, and makes it more and more indispensable to our city.*" The late Prof. Page, one of the best electrical authorities, claimed that it is "*a signal triumph of science.*" Gen. Stager testifies that "*it affords the best protection of any system known to him.*" We can scarcely add to the force of such testimony. More of this anon.

**Stenographic Reporting by Machinery.**

It is said that a stenographic press has been invented in England by the use of which the art of reporting *verbatim* can be acquired in much less time than by the old methods. The reporter sits at something like the keyboard of a piano forte, and by applying his fingers to the keys, prints the words as they drop from the lips of the speaker, syllable by syllable, on a strip of paper which rolls along underneath. When we say this, we do not, of course, mean that the words are printed in letters. The keyboard appears to be divided into three parts of eight keys each. The left

side, worked by the four fingers of the left hand, prints signs which represent initial consonants; the right, worked by the fingers of the right hand, prints final consonants; and the middle, acted on by the two thumbs, prints the medium vowels. We gather that something like a phonetic system of signs is employed. A few months' practice is said to enable any operator to follow the most fluent speaker with ease. We ought to say that M. Gensoul's system renders it unnecessary to transcribe the copy. Just as with the phonetic system, if legibly written, the compositor can set up the speech in common type, from the printed strip furnished by the machine. As to the comparative ease of writing characters with a pen and printing them in the way here described, we can give no opinion.

**Bulls.**

It is said of operators that if they do occasionally make bad bulls, the credit of the horns is often due to the fearful manuscript and orthography of the messages left with them to transmit. Here is a message left at the office in Troy, N. Y., which we give as a specimen brick:

"One load will be a *Knife*!"

The writer of that message is probably a greedy character and to whom the word "enough" is an unfamiliar term. Besides, he may have had so big a load on as to be conscious that it was quite a *Knife* for him.

**A HOTEL MESSAGE.**

"Have a room with five in it."

Sociable fellow that, but what he wanted was *five*.

**A FAMILY MESSAGE.**

"Your children are 100!"

Fancy a father's pheelix on receipt of such a message! But the message only announced to him that his children were *well*.

**A DEATH MESSAGE.**

"John is dead *beaf*. Depot this evening."

This was certainly a very unfeeling way of announcing that—

"John is dead. Be at depot this evening."

**ANOTHER DEATH MESSAGE.**

"Brother lyed last night."

Now we submit that such a message must have mixed up an agitated family in images of soapfat, ashes and immortality, instead of the grave announcement it was designed to make.

**A BAD ECCLESIASTICAL BULL.**

A message transmitting the intelligence that "the Presbytery lacked a quorum to ordain," caused a prodigious amount of unnecessary theological dismay by announcing it in the following extraordinary manner.

"The Presbytery tacked a worm onto Adam!"

This is really too bad. Had a febrifuge been sent to our worthy ancestor by the Presbytery it would have been tolerable, but to *tack a worm onto him* with an ecclesiastical hammer by telegraph is too much.

**Married.**

NESBITT—KIGHT. September 22d, by the rev. Mr. Haalup, Mr. J. G. Nesbitt, Manager of Western Union Telegraph office, to Miss Jennie Kight, both of Piedmont, West Virginia.

FRANK L. POPE,  
TELEGRAPHIC AND ELECTRICAL ENGINEER,  
Nos. 78 and 80 Broadway, Room 48,  
NEW YORK.

**AMERICAN FIRE ALARM**

AND  
POLICE TELEGRAPH.

GAMEWELL & CO., PROPRIETORS,

NO. 104 CENTRE STREET, NEW YORK.

This system of Fire Alarm Telegraph, with a central office, or upon the

**AUTOMATIC PLAN,**

is now in operation in the following cities, to which reference is made for evidence of its great SUPERIORITY AND VALUE, and UNIFORM reliability:

BOSTON,	PORTLAND,
CHICAGO,	ST. JOHN, N. B.,
PHILADELPHIA,	HARTFORD,
CINCINNATI,	TROY,
ST. LOUIS,	NEW HAVEN,
BUFFALO,	ROCHESTER,
BALTIMORE,	SPRINGFIELD,
MOBILE,	TOLEDO,
NEW ORLEANS,	ALBANY,
PITTSBURG,	COLUMBUS,
LOUISVILLE,	LAWRENCE,
ALLEGHENY,	MILWAUKEE,
MONTREAL,	SAN FRANCISCO,
QUEBEC,	CAMBRIDGE,

WASHINGTON, D. C.

**The distinctive features of****THE AMERICAN FIRE ALARM TELEGRAPH**

are a Combination of Circuits, the Automatic Signal Boxes, Electro-Mechanical Bell and Gong Strikers.

THE AMERICAN FIRE ALARM AND POLICE TELEGRAPH is covered by some twenty patents. Very early after its introduction into Boston, GAMEWELL & Co. purchased the original patents of FARMER & CHANNING, and during the past fifteen years have spared no expense or pains to improve and perfect this system.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

**THE STANDARD**

AMERICAN WORK ON THE TELEGRAPH.

MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUGH, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SABINE.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. AMSON STAGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—*The Telegrapher*.

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—*London Mechanical Magazine*.

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—*Journal of the Telegraph*.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS,

PUBLISHERS,  
28, 30, 32 Centre Street.

# Journal of the Telegraph.

## Ocean Telegraph Company.

A company has been formed in England under the Presidency of Earl Poulett, to run a cable on the new and cheap plan invented by Mr. C. F. Varley, from the coast of Ireland to Halifax, N. S. So light is the cable that a great vessel like the Great Eastern will not be required to lay it, and its contract price, it is said, will not exceed £450,000.

This cable is spoken of as of very curious and simple construction. It has been for a long time under examination and tested by Sir William Thompson, who gives unqualified testimony to its merits. Light cables have not hitherto been successful, and have been superseded by heavy ones. The proposal to lay a cable so light as the one referred to, supposes some peculiarity of construction which we are curious to understand.

## Coating Submarine Cables.

Mr. Henry Clifford, of Greenwich, proposes to protect the cores of submarine cables from the attacks of insects by coating, or serving them with powdered silica. The silica is made to adhere to the yarn or tape, which has been previously steeped in tar or pitch, the yarn or tape being afterwards wound round the core upon the usual serving of yarn. The core is afterwards surrounded by the usual outer covering.

## Ripening of Grapes by Cutting away part of the Leaves.

M. J. Comte.—At a meeting of the Agricultural Society of Agen, the author called attention to a chemico-physiological fact of great importance. It appears to have been an old custom, and is yet so, to pull off from the vines, especially in the Southern part of France, a large quantity of leaves, especially close to where the fruit is placed on the stems, so as to allow full sunlight to fall on the grapes, which, in consequence thereof, soon get an amber-yellow color, and appear to be over ripe. The author condemns this custom; and, while citing, among the older authorities on this subject, MM. Rosier and Chaptel, he states that, as regards the grapes, the presence of the leaves, as arranged by nature, is absolutely necessary to them for perfecting their maturity, which means for converting into grape sugar a portion of the acids present in the unripe grapes in large quantity. The carbonization (by which word the author understands the addition of carbon to the acids) is effected by the leaves, through which the vegetable juice passes, for the purpose of becoming deoxidised. Fully ripe grapes should exhibit an agreeable green color; grapes taken from the vine before they are ripe do not reach maturity at all, as other fruit does, but remain as they were. Taking away the leaves, therefore, does not ripen, or speed the ripening of the fruit, but only alters its color to a shade of yellow, which genuinely ripe grown grapes never present. The taste of these yellow grapes is intensely sour, while that of the green colored ripe grapes is extremely sweet. The author regrets that the foolish practice alluded to is not authoritatively prohibited, on sanitary grounds, and for the reason that it is very injurious to the fruit bearing of vineyards.

## STICKWELL & CO.'S

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spanning "or any other man." It is as cheap as the worthless trash sold under another name. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. OONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor.

## SPECIAL NOTICE

L. G. TILLOTSON & CO.,

11 DRY STREET, NEW YORK,

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufacture in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

## Western Union Telegraph Company.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, falling to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

J. D. REID, Treasurer.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**CHESTER, PATRICK & CO.,**

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (Induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON &amp; CO., No. 11 Dey street.

**THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

GEORGE H. BLISS,

Chicago.

**L. G. TILLOTSON & CO.,**

11 DEY STREET, NEW YORK,

MANUFACTURERS OF

GLASS INSULATORS, ALL PATTERNS,

Zincs, Porous Cups, Platinum, Acids, Quicksilver, Tumblers, Coppers, &amp;c. All of the most approved Pattern and Best Quality.

REGISTER PAPER, MANIFOLD PAPER, MESSAGE PAPER (IN STRIPS).

Printed Message Heads and Envelopes

On hand and furnished to order.

WIRE, GALVANIZED AND PLAIN,

AT THE

LOWEST MANUFACTURERS' PRICES.

COPPER AND BRASS WIRE

Of any number required.

OFFICE WIRE,

GUTTA PERCHA or COTTON COVERED

AND

MAGNET WIRE.

REGISTERS,

RELAY MAGNETS,

SOUNDERS, KEYS,

CIRCUIT-CLOSERS,

CUT OUTS,

SWITCH-BOARDS,

BINDING-SCREWS,

PAPER-REELS,

LIGHTNING-ARRESTERS,

REPAIRERS' TOOLS,

&amp;c., &amp;c., &amp;c., &amp;c.

OF EVERY DESCRIPTION.

CABLES

Of any desired Size and Pattern. American Manufacture. We shall be happy to answer all inquiries and furnish any required information promptly.

L. G. TILLOTSON &amp; Co.

No. 11 Dey street, New-York.

**SAMUEL C. BISHOP,**

Successor to

THE BISHOP GUTTA PERCHA COMPANY.

The Original and Only Manufacturer in the United States of every description of

PURE GUTTA PERCHA GOODS.

INSULATED SUBMARINE TELEGRAPH CABLES.

INSULATED TELEGRAPH AND ELECTRIC WIRE.

The Insulation of Telegraph and Electric Wire with Gutta Percha has been adopted by the manufacturers of these articles, in Europe as well as here, and in an experience of over TWENTY YEARS has never failed.

I also Manufacture

WATER, BEER AND SODA PIPE,

CHEMICAL VESSELS,

GUTTA PERCHA SHEET OF ALL THICKNESSES,

TISSUE SHEET FOR HAT AND CAP MAKERS' USE

COTTON AND SILK COVERED WIRE,

BRIDGE'S ELECTRIC CORDAGE,

BISHOP'S COMPOUND CORDAGE, &amp;c., &amp;c.

FACTORY, 42, 44, 46 EAST TWENTY-FIFTH STREET.

OFFICE AT FACTORY.

SAMUEL C. BISHOP.

WALTER O. LEWIS, Esq.,

Electrician of the Company.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,  
21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET,  
PHILADELPHIA.

The guarantees of this insulator are :

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

## OPERATING THE ATLANTIC CABLES.

(From Pope's Modern Practice.)

**THOMPSON'S REFLECTING GALVANOMETER.**—This is the most delicate apparatus of this kind which has yet been devised, and is for this reason employed in operating the Atlantic cables.

The special feature which distinguishes this galvanometer from an ordinary one, is the extreme lightness of the magnet or needle, and the delicacy with which it is suspended in a horizontal position. Instead of an index needle, to render the motions of the magnet visible to the eye, a reflected ray of light is made use of, which, of course, can be made of any required length. This arrangement is of great practical value in measuring faint electrical currents, too feeble to be indicated by any other apparatus. It is especially valuable in submarine telegraphing, because it permits the use of such extremely low battery power.

When the insulation of a cable is in the slightest degree defective at any point, a current of intensity has a tendency to aggravate the fault, and to corrode and eat away the conductor by chemical decomposition, at the point where the escape occurs, finally destroying the communication altogether.

Fig. 59 is a side elevation of this instrument, showing a section through the galvanometer coils and the outer case containing them. Fig. 60 is a cross section through the coils, showing the magnet, technically termed the needle. Similar letters refer to like parts in both figures.

The magnet A is a small bar of steel, one half inch in length and one tenth of an inch square, cemented to the back of a very thin circular glass mirror, *a*. The mirror is suspended in a brass frame, B (Fig. 61), by an exceedingly delicate silk fibre, and is adjusted in height by the screw *b*. This frame slides into a vertical groove left in the center of the coil, dividing it into two parts. The coil and mirror are enclosed in the brass case D, this case having pieces of glass let in wherever necessary, to permit the passage of light. The object of this arrangement is to prevent the mirror and its attached needle from being disturbed by currents of air.

A narrow pencil of luminous rays from the lamp, E, passes through the opening, F, which is capable of adjustment by the slide G. This pencil of light, passing through the lens, is reflected by the mirror back through the lens upon an ivory scale at I, as shown by the dotted lines. The scale is horizontal, extending to the right and left of the center of the instrument,

the zero point being exactly opposite the lens. The luminous pencil is brought to a sharp focus upon the scale by a sliding adjustment of the lens M, in the tube N. When the needle is at rest in its normal position, and no current is passing, the spot of light which serves as an index will remain at zero on the scale.

The operator reads the signals from a point just in the rear of the magnet and coils, the light of the lamp being cut off by the screen Y, so that he only sees the instrument, and a brilliantly defined image of the slit upon the white ivory scale just above, which is kept in deep shadow by the screen Y. A very minute displacement of the magnet gives a very large movement of the ray of light on the scale I, the angular displacement of the ray of light being double that of the needle.

It is obvious that the ray of light from the needle

needle, in such a manner that it can be turned horizontally so as to follow the movements of the needle, or be removed nearer to or further from it vertically. If it is placed with its south pole over the north pole of the needle, it will add its directive force to that of the earth, and by holding the needle more powerfully in its position, will lessen its sensitiveness. The nearer the magnet approaches the needle the greater will be its power over it, and it can be arranged so as to hold the needle in any desired position. If it is placed in a reverse direction, so as to repel the needle instead of attracting it, it will lessen the attractive force of the earth so as to increase its sensitiveness, and in a certain position will render the galvanometer astatic. When the magnet is too near the needle it repels to the full extent of the scale. If it is raised upon the supporting rod the repelling effect will decrease, until, at a certain distance from the magnet,

the spot of light on the scale can be held at zero. The greatest sensibility is obtained at the point at which the slightest lowering of the magnet upon the rod will again repel the needle to the full extent of its swing.

An improvement in this instrument, made by Mr. C. F. Varley, consists in giving the mirror a concave form, silvered upon the back, and thus dispensing with the use of the lens above described.

**MODE OF WORKING THE ATLANTIC CABLES.**—Very little has been made public in regard to the precise method employed in signaling through the Atlantic cables. As before

remarked, the reflecting galvanometer is employed as a receiving instrument, and by employing deflections on one side of zero to represent dashes, and those on the other side dots, the Morse alphabet is found to answer the purpose admirably. It is said that the two cables have been looped in a metallic circuit without ground connection, and that they have also been worked separately with and without condensers. The latter method is made use of in order to avoid the disturbances generated by what are known as "earth currents."

Different parts of the earth and sea are found to be at different electric potentials. One part is electro-positive or electro-negative to another. That is to say, there is the same difference between the two parts of the earth that exists between the two poles of a battery. If, therefore, these two points are joined by a wire, a current will flow through that wire as if from a battery, and this current is termed an earth current, to distinguish it from the current generated by an ordi-

Fig. 1.

Fig. 2.

nary voltaic battery. This difference of potential between two given points, such as Newfoundland and Valencia, is not constant but continually varies, causing a corresponding variation in the current it produces. This current and its fluctuations interfere with the signaling current, disturbing the distinctness of the signals. When very rapid changes take place in the electric condition of the earth, it is known as a magnetic storm, and this occasionally interferes with the working of all telegraph lines.

By the method of working with condensers the disturbances from this cause are avoided. The condenser is constructed of alternate layers of tin foil and thin plates of mica, gutta percha or paper, saturated with paraffine, arranged like the leaves of an interleaved book. Each alternate metal plate is connected so as to form two distinct series, insulated from each other, one of which is connected with the line and the other with the earth. By an inductive action, similar to that of the well known Leyden jar, a quantity of electricity, in proportion to the amount of surface exposed, may be accumulated or stored up upon the metallic plates. If, therefore, one series of plates be charged with positive electricity the other series will become negative by induction, and by means of this induction a much larger quantity of electricity may be accumulated than would otherwise be the case.

The manner in which the condenser is made use of in working a cable is as follows:

The sending apparatus consists of a battery, B (Fig. 61), which is permanently connected with the cable through the back contact of a Morse key, K, and the cable is therefore kept constantly charged from this battery. When the key is depressed the cable is placed in connection with the earth at E. The re-

ceiving apparatus consists of the reflecting galvanometer, G, one terminal of which is attached to the cable and the other to one series of plates in the condenser C—the other series being connected with the earth, as shown in the figure. R is a very high resistance, inserted in a wire leading from the point O, between the cable and the galvanometer, so as to allow a very slight but constant leakage from the cable to the earth. The cable is, therefore, charged to the tension of the battery B, and the condenser to a tension equal to that of the point O—but owing to the high resistance at R the tensions are nearly the same. Upon charging the cable with the battery at K a charge of electricity enters the cable, and a quantity sufficient to charge the condenser passes through the galvanometer, deflecting the mirror until the condenser is charged equal to the tension of the point O—when the mirror will return to zero. By putting the cable to earth at K, a portion of the charge will be withdrawn, and the tension of the point O lowered below that of the condenser. A portion of the charge of the latter, therefore, flows into the cable, deflecting the galvanometer in the opposite direction. The right and left hand deflections necessary for signaling are therefore produced without reversing the currents, or rendering it necessary to entirely discharge the cable after each signal. This mode of signaling possesses many important advantages over the old method, in point of rapidity of action and freedom from interference by

earth currents. The rate of working through the cable by expert operators is said to average from fifteen to twenty words per minute.

#### Galvanic Chain.

"The galvanic chain," says *The Druggist*, "is really an instrument of most ingenious and beautiful construction, and is one of the handiest and most effective which the medical practitioner can employ. It is in the form of a flat flexible chain, and comprises 120 separate pairs of galvanic elements. These consist each of a small zinc tube for the electro-positive portion, surrounded with copper rings, which form the electro-negative. The copper of one pair of elements is hooked into the inner side of the zinc tube preceding, while it is isolated from the zinc of its own pair by a simple but most ingenious set of stitches of thread. This petty flexible battery of 120 pairs is excited by simply dipping it into vinegar, and the links are near enough to retain sufficient fluid by capillary attraction to keep up the action for some time. There is thus constituted a battery yielding a very small quantity of galvanism, owing to the small size of the individual elements, but high intensity owing to their number. It easily decomposes water, and of course saline solutions, and may be used to demonstrate the process of electrolysis. For medical purposes it yields a direct current, which is the desideratum for neuralgic affections, very decidedly but not violently. By attaching a little vibrating spring in the course of the conductor it gives a succession of interrupted shocks, such as are useful for muscular and paralytic affections. Most of the cheap and handy electro-magnetic machines, as is well known, give only the interrupted, but not the continuous. The chain is an instrument of power and precision and convenience, and as such we recommend it to our medical brethren for the cases in which galvanism is known to be of use. There is another apparatus, called a belt, also flexible and containing about forty elements of zinc and copper wire ingeniously interlaced and isolated."

#### An Ingenious Instrument.

(From the London Globe.)

One of the most remarkable objects at the recent meeting of the mechanical engineers at Newcastle was the new chronoscope, for measuring the velocity of a projectile within the bore of a gun, the invention of Captain Andrew Noble, late Royal Artillery, now of the firm of Sir William Armstrong & Co. This wonderful instrument is capable of measuring portions of time so minute that the human mind is as unable to realize them as it is to grasp ideas of infinity. To most of us a second of time seems to us to pass very rapidly, and a clock denoting tenths of seconds is looked upon as a most accurate instrument. What shall we say, then, to a machine capable of dividing the second into a million parts?—to an instrument where the inaccuracy of the thousandth part of a second would be a greater comparative error than the loss of an hour a day by an ordinary watch? The chronoscope consists of six brass disks, each 36 inches in circumference and about an  $\frac{1}{8}$ -inch thick. These are firmly secured to a spindle or axle, which is geared to a train of wheelwork, the whole being driven by a weight something similar to a clock weight. Each wheel travels five times as fast as the one immediately preceding it, so that a very rapid motion of rotation is imparted to the disks, the rate of speed being measured by a clock or stop watch attached to one of the slower moving wheels. When the instrument is in full spin, the disks are revolving at a rate of about 28 times in one second, and as they are 36 inches in circumference, an inch of disk corresponds to about the thousandth part of a second, the tenth of an inch to the ten thousandth part of a

second, and the thousandth of an inch to the millionth of a second. The instrument is provided with a graduated scale vernier and magnifier, by which the thousandth of an inch is read off. The passage of the shot in the bore of the gun is recorded on the edge of each disk by a tiny electric spark derived from a Ruhmkorff coil. A brass discharger is fixed in an ebonite plate opposite each disk, wires pass from this through an electric battery and coil to the gun, where they communicate with the interior of the bore by means of screw plugs in the side of the gun. The shot cannot pass out of the bore without cutting the wires thus communicating with the inside, and as each wire is cut, a spark is emitted from a discharger, and the edge of the corresponding disk receives a mark on some prepared paper with which it is covered. Thus, let us suppose the gun to be fitted with six plugs, each two inches apart, the first being in such a position that when the gun is loaded the front part of the shot just touches the first wire. The instant the gun is discharged the shot begins to move, and so breaks the first wire and marks the first disk; it then breaks the second wire, and marks the second disk, &c., &c., until it finally breaks the sixth wire, and marks the sixth disk. While, however, the shot was passing from the first to the sixth wire the instrument was revolving; and the sparks, instead of being in a straight line on the disks, will appear in *echelon*, the distance between each of them corresponding to the time taken by the projectile, in passing from wire to wire. This most ingenious instrument has been in use for some months at Woolwich, and will be extensively used by the special committee on explosives during their experiments on the pressure of fired gunpowder of various descriptions in the bores of heavy guns.

#### Stanley's Improved Electrical Machine.

In the usual glass plate electrifying machine, the plate is supported on a stand, and revolves between two stout uprights. Mr. Stanley has done away with these, and has substituted a very convenient arrangement which may be described as follows:—In the first place, two thin slips of wood brought close together, so as to allow only a space between them sufficiently wide to hold the glass, supply the place of the usual standards. These slips are united at one pair of ends so as to form a handle, by which the machine may be held without any other support, and is therefore portable, and may be used in a horizontal position. It will generally be convenient in accordance with this construction, to unite the other pair of ends of the slips of wood so as to form a clamp to bite the edge of the table, or a small perpendicular surface to press vertically on the table. In the second place, all apparatus connected with the rubbers is dispensed with, and the two slips, which take the place of standards, form also the base of the rubbers which are merely pieces of covered felt glued on the slips. Thirdly, the axle of the "plate glass machine" is uniformly made of metal, here it is made of wood, which is cheaper and also a better insulating material. Fourthly, the glass plate in the ordinary machine is made of thick plate glass, but in this it is made of common sheet glass; hence there is a great saving of expense. Fifthly, with the above construction the remaining details are necessarily modified. The conductor is made of a simple ball, and a collecting comb; made of wire gauze, fixed by a glass or vulcanite stem upon the slips of wood, instead of the ordinary brass tube conductor. This arrangement is evidently extremely simple, and will, doubtless, be found very useful and accessible from its cheapness.

The world was built in order. It is the visual record of its Maker's logic, and to us have been trusted the will and power to grapple with the mighty argument.

**"Fast" Methods of Telegraphy.**

[From President Orton's Annual Report.]

It is a favorite device of the promoters of speculative telegraph schemes, to pretend to control some important improvement in the art of telegraphy, which will give their lines special and peculiar advantages over all others. It is currently reported that a new telegraphic bubble is about to be floated, having for the inflating power a wonderfully rapid means of transmitting dispatches by the automatic process. The patent for the automatic or "fast" system is owned by the Western Union Company, and no cause, therefore, exists for apprehending its use upon rival lines; but inasmuch as we have given it a long, thorough and expensive trial, the result of which is that we have discarded it as totally impracticable, I deem it proper to give the subject a brief mention.

For many years past efforts have been made to perfect a system of rapid telegraphing, which should be able to transmit several times as many dispatches per hour over a telegraph wire as can be done by the Morse instrument. The theory upon which all the experimenters in this direction have proceeded is that electricity has a definite velocity like light, and that all that is necessary to produce the most rapid writing at any distance, is an instrument to record the signals produced by an automatic process, similar in principle to Professor Morse's original type and port rule transmitter.

In 1844 Mr. Bain, of Edinburgh, devised a plan of perforating the dispatches for transmission through a strip of paper, in the characters of the Morse alphabet. The prepared paper was then passed between a metallic comb and roller, which were in connection with the line wire, the circuit being completed when the teeth of the comb passed through the holes in the paper. At the receiving station he used chemically prepared paper, upon which the messages were recorded in colored dots and lines. The apparatus, although very attractive in theory, has never been of any practical value, as the time occupied in preparing the messages for transmission is many times greater than that required for sending by the Morse system, and an equal, if not greater length of time is consumed in copying them, while the Morse operator, who reads by sound, copies his messages as fast as they are sent. Subsequently, Mr. Humaston and others invented instruments for more rapidly perforating the paper, which it was thought by some would bring the "fast system" into general use, but these anticipations have never been realized. Mr. Humaston's apparatus, although very ingenious in design, is of so complicated a character as easily to get out of order, while its capacity for producing the Morse characters, when worked by an expert operator, is only about one third as great as that of the ordinary hand key. Added to these difficulties are the still more serious ones that messages cannot be sent by this system at a faster rate of speed than by the ordinary Morse apparatus, except over comparatively short distances; that it cannot be used upon a wire strung upon poles with other wires; nor will it work during a magnetic storm, except by the employment of a double line. Taking all of its merits and demerits into account, it is so greatly inferior to the Morse, and other systems in use, that it cannot be profitably employed either in connection or in competition with them. When the fast method was invented the relative proportion of telegraphic facilities to the requirements of the public was very small, but during the score of years which have intervened, the rate of increase of the lines has exceeded that of the business, so that at the present time there are not only enough wires to transmit all that is offered, but they are equal to the performance of a much larger service, provided the messages could submit to a delay as great as that

required to prepare them for transmission by the punching process. Therefore, the introduction of the complicated automatic system, even if it were practicable, is unnecessary.

The bulk of the business is received at our offices for transmission between the hours of eleven A. M. and two P. M., and all must receive immediate dispatch—both law and custom requiring that every message shall be forwarded in the order of its receipt. This peculiarity of the service necessitates the erection of many more wires than would be necessary if the work could be spread over the whole day. In Belgium speed rates are established to compensate for the loss by the reduced tariff, and a telegram requiring immediate transit is charged three times the ordinary rate. This innovation is embodied in the so-called postal telegraph system sought to be introduced in this country. Were this plan inaugurated here, business men, to whom time is money, would be obliged to pay an extra price to secure that promptness and certainty of transmission without which the telegraph is of little value for all important transactions.

The value of the telegraph does not consist in the amount of time which can be saved by it over the mail or other means of communication, but in its practical annihilation of time. A telegraphic dispatch, for example, might occupy two days in going from New York to London, and yet reach there eight days in advance of the mail, but this would not be a proper performance of the functions of the telegraph. Instant and constant communication is what is required, and hence the introduction of any apparatus which interposes an unnecessary delay in the preparation of dispatches, either for transmission or delivery, is a change for the worse. This is a disadvantage which the so-called "fast systems" labor under, and which will forever preclude their use.

The automatic system, however, is especially unfitted for the transmission of press reports, as this process enables but one station to receive at the same time, while the Morse wires can be connected throughout the country, and the news sent to every office with a single manipulation. The preparation for transmission of so great an amount of matter by the punching process as we daily transmit for the press, would entail an expense for labor and machinery far greater than the entire receipts of this Company for regular press reports.

**Automatic Transmission of Heart Beat.**

At the conclusion of the lecture of Dr. Upham, before the Science Association at Salem, he gave some remarkable experiments. The beatings of the hearts of several of the physicians and patients of the City Hospital, in Boston, were automatically transmitted by telegraph from the hospital to the hall in Salem. By means of the magnesium light these pulsations were made to manifest themselves to the sight by the vibration of a beam of light on the wall of the darkened room. A regular pulse of 60 per minute was first sent. Then was transmitted the healthy pulse of an excited person, regular, but having a rapidity of 90 per minute. But the most interesting cases were those of a patient suffering from pneumonia, whose pulsations numbered 118 per minute, and that of another afflicted with organic disease of the heart. The irregularity of the beats in this latter case was vividly impressed on the mind by the sounds of the instrument. Prof. Farmer, the well-known electrician, assisted by a skillful operator from Boston, had charge of the electrical arrangements in Salem. Dr. Knight was in charge at the hospital in Boston. It needs only to be added that these experiments are entirely new, and have their origin in Dr. Upham's studies.

**OBITUARY.**

DIED.

At Edgefield Junction, Tenn., Sept. 12th, 1869, in the 29th year of his age—MR. JOHN BOHANNA, late Agent of the New York Associated Press and Agent of the Western Union Telegraph Co's Commercial News Department, at Mobile, Ala.

Mr. Bohanna was a native of Ireland; came to the United States in early boyhood. He had been identified with telegraphing for ten or twelve years, prior to his death in the South, during which time he had filled many important positions.

Shortly after having acquired a knowledge of the profession, Mr. Bohanna was appointed manager of the Florence, Ala., office, the citizens of which place finally attested their appreciation of his merits, both as a man and as an artist, by presenting him with a splendid gold watch and chain, suitably inscribed, upon his departure from their midst.

He was possessed of a happy disposition and a flow of wit and humor which all the powers of adverse fortune could neither becloud nor diminish. He was true to every trust—strong in his friendships—open in his enmities—pleasing in his manners and blameless in his life. His head and his heart had each its respective wealth of fine qualities, and the nobility of his nature proclaimed him a type of the true man.

John Bohanna's name and memory shall live forever in the hearts of all those who knew him, for "to know him was to love him."

A FRIEND.

New Orleans, Louisiana.

**Electric Engraving Machine.**

A machine for engraving the cylinders of copper or brass employed in printing woven fabrics and paper hangings, is an invention of French origin. The voltaic current is used to determine, by means of electromagnets, the slight simultaneous advance or withdrawal of any number of engraving diamond points from the varnished surface of the copper rollers to be engraved, according to the position of a corresponding metal contact point on the non-conducting surface of a prepared pattern. The pattern and cylinder to be engraved are moved mechanically in concert, and the proportion of their relative movements can be varied by mechanical adjustment. The engraving points have a slight vibrating motion given to them, which scratches off the varnish whenever brought into contact with it, and produces a series of fine zigzag lines, which facilitate the retention of the pasty coloring matter used. The prepared pattern determines the moments at which this contact occurs; and the concert between the movements of the pattern and the roller produces a similar agreement between the pattern and the figures engraved which may clearly be made larger or smaller than the pattern in any desired proportion and in any required number. The copper when exposed is afterwards etched by an acid bath.

The double transmitter—an apparatus for working both ways over one wire at the same time—has long occupied a prominent place among speculative telegraphers, and has recently been extensively advertised by the promoters of various competing lines. During the past twenty years there have been several inventions for accomplishing this result, the first being that of Dr. Gintl, of Germany; but while it is possible, under certain exceptional circumstances, to transmit messages both ways at the same time, over one wire, the conditions under which this result is obtained are such as to render the general use of the system impossible. If there were, however, any practical value in this apparatus, its use—like that of the Morse telegraph—is freely open to all.

## The Propagation of the Electric Current.

## REVIEW OF MR. POPE'S NOTIONS.

Mr. Pope, in the last number of the *Journal*, again calls attention to his views of tension, and manifests an evident intention to maintain the force of his pretension—if I may be allowed the mention—by a persistent extension and distension of the subject of discussion. The original assertion of Mr. Pope, and the cause of this controversy, was, that "the electric current is caused by the difference of tension between the two poles of the battery;" the correctness of which I objected to as inconsistent with the fact that the tension is equal at both ends of the battery, and to the generally received theory that the electric current is due to the reunion or neutralization of the two opposite electrical principles.

In reply Mr. Pope attempted to maintain his view by showing the analogy between the flow of the electric current and a current of water, and by an illustration of a closed circuit, in which the tensions are represented to be 0 at both ends and in the middle. In answer to these arguments, I pointed out, in the first place, that the current of water did not arise from the force of tension but of gravitation; and in the second place that a telegraph wire depending upon a current due to a difference in tension, must be in a bad condition for service when the tension was 0 at both ends and in the middle. Mr. Pope now makes a complete change of base, and instead of treating his assumption as a theorem which is required to be proved, he treats it as a proposition the truth of which is admitted, and which only requires illustration. In other words he begs the question at issue, and assuming his hypothesis to be an acknowledged fact, proceeds to illustrate it by a geometrical diagram, in which he represents the tension of one of the poles of the line as being as much above as the other is below the neutral line, thus assuming as a fact the very point under discussion. By the same diagram he could represent equally as well that water is forced through a pipe by a difference in tension, or that the attractive force of an electro-magnet is due to a difference in tension between the two poles of the helices.

The difference between Messrs. Clark, Culley and Gavaret's theories of the propagation of the electric current which Mr. Pope has adopted, and those of Muller, Poggendorff and De la Rive, which I have attempted to illustrate, may be briefly stated as follows:

The former assumes that a galvanic battery generates a single fluid; one pole of the pile having a plus and the other a minus tension: one of the tensions being as much above as the other is below zero.

The latter assumes that a galvanic battery generates two fluids; one pole of the pile having positive and the other negative electricity: the tension being equal at both ends.

One theory in short assumes that an electric current is composed of a single fluid with different tensions: the other that it is composed of two fluids with similar tensions.

These two theories are based upon the adoption of either Franklin's single fluid, or of Symmer's two fluid hypothesis.

Mr. Webb's mathematical formula, which Mr. Pope deems so conclusive in establishing the correctness of his views that to doubt them necessitates the repudiation of Ohm and Euclid, is based upon the assumption of plus and minus tensions in a circuit, which is the very principle involved in the discussion. I regard the single fluid theory, upon which this hypothesis depends, as indefensible in view of the results obtained through the action of galvanic currents; and it was to prove its incorrectness that I produced so many illustrations from the most eminent electricians of the age,

and which Mr. Pope declares are not in any manner inconsistent with his views.

After reproducing Mr. Webb's formula, Mr. Pope says:

"If any further proof is required in support of the theory of tensions illustrated above, and of the inconsistency of Mr. Prescott's objections thereto, it may readily be obtained by actual experiment. Connect a wire to the earth from the neutral point in the middle of the closed circuit of a telegraph line, and insert a galvanometer or relay. It will be found that no current whatever will pass between the line and the earth, which proves that the electric potential, at that point, is zero, or the same as that of the earth."

Unless Mr. Prescott is prepared to repudiate Ohm and Euclid, as well as Clark, Varley, Gavarette *et al.*, I do not see how he can reach a different result from the one I have given above."

Now I think I can illustrate the incorrectness of the above conclusion without "repudiating" either Ohm or Euclid, particularly as neither of these distinguished savans have either formularized or speculated upon the subject. The following diagram is arranged according to Mr. Pope's suggestion:

Now if a galvanometer or relay, be placed in the earth wire in the middle of the line, no effect will be produced upon it, but it does not follow that no current passes between the wire and the ground. The reason why no effect is produced upon the galvanometer or relay under such circumstances, is that the effect of the two currents which do pass are neutralized, since the current from one-half of the line passes over such wire in a contrary direction to that of the other half. If Mr. Pope's theory were correct and his reasoning were consistent, no current would pass between the two grounded poles of the batteries and the earth, since he elsewhere says: "the tension of the earth being considered as zero, the grounded pole of each main battery is zero." Now if his explanation of the fact that no effect is produced upon the galvanometer when placed in the earth wire in the middle of the line be correct, viz.: "because the potential at that point is zero," then it follows as a natural consequence that no effect would be produced upon the galvanometer or relay when placed between either main battery and the ground. There is of course no way of avoiding this conclusion, and yet even Mr. Pope would scarcely claim that no current passes from the grounded poles of the main batteries into the earth, nor that if a galvanometer or relay were inserted in such ground wire between the battery and the earth, that no effect would be produced upon it.

Certain statements are presented in Mr. Pope's last article, which do not seem relevant to the subject of discussion, and which I am at a loss to comprehend the purpose of making. For example, in starting out to illustrate his theory of tension, he says he "takes Ohm's formula as a point of departure;" but why he selects this point rather than the North Pole, or the antipodes, is not apparent, as the latter, equally with the former, have no connection with the subject of controversy. The object of Ohm's law is to enable us to determine what the strength of current will be under certain given conditions, and not to demonstrate how the current is created nor how it is propagated. He pays a gratifying tribute to the memory of Ohm, however, when he announces that his somewhat familiar law has been "verified by experiment," and I think Ohm may now be regarded as an authority. In regard to the geometrical diagram proposed to represent the rate of speed of a railway train, I would remark that I hardly think if the train were running at an irregular rate of speed—as they

usually do when I travel in them—varying say from 10 to 40 miles an hour, that the angle of inclination of the hypotenuse would accurately represent the rate of speed upon every mile of the road. If the average rate of speed of the train is the object sought for, it can be obtained in a much easier way, by simply dividing the number of miles traveled by the time occupied in running it. I must confess, however, my inability to perceive what relation there is between the rate of speed of a railway train, and the cause of the propagation of an electric current. I am sure that Mr. Pope does not mean to imply that the force by which the train is propelled is caused by a difference in tension between the two ends of the track. Perhaps, however, he only used the illustration to show that the speed of the train, like the flow of water through a pipe was a result of a "disturbance of equilibrium."

In answer to his assertion that my play upon words in regard to the definition of the term zero will hardly pass muster, I would say that it is so long since I have attended one, that I really don't know whether it would or not, but the last time I was present at a muster it was allowable to play on almost anything. Seriously, however, I must confess that until Mr. Pope can demonstrate how the difference between three nothings can produce a dynamic force, I must regard his explanation as paradoxical, and the so-called play upon words simply a *reductio ad absurdum*.

G. B. PRESCOTT.

## The Magnet.

A correspondent in *Notes and Queries* forwards the following interesting extract from "Pseudodoxia Epidemica, or Inquiries into Vulgar and Common Errors," concerning the magnet:—"But certainly false it is what is commonly affirmed and believed, that garlick doth hinder the attraction of the loadstone; which is, notwithstanding, delivered by grave and worthy writers, by Pliny, Solinus, Ptolemy, Plutarch, Albertus, Mathiolus, Ruens, Langius, and many more. An effect as strange as that of Homer's moly, and the garlick the gods bestowed upon Ulysses. But that it is evidently false many experiments declare; for an iron wire, heated red hot, and quenched in the juice of garlick, doth, notwithstanding, contract a verticity from the earth and attracteth the southern point of the needle. If also the tooth of a loadstone be covered, or stuck in garlick, it will, notwithstanding, attract and animate any needles excited and fixed in garlick, until they begin to rust, doe yet retaineth their attractive and polary respects."

## Chili.

VALPARAISO, Sep. 3.—The new telegraph line will soon become an accomplished fact. It is to be a double line, and is to start from Valparaiso, passing through the capital, Santiago Santa Rosa, and San Felipe, crossing the Andes at the mining town of San Juan; thence to Villa Maria, where it will join the line already established from Rosario to Cordoba, passing through Mendoza San Luis, and thence to Buenos Ayres, thus connecting the Atlantic and Pacific coasts of South America via the Cordillera. The contractors for the line, Messrs Clark & Co., of this city, have been granted a subsidy of \$3,000 by the Argentine Government, and it is to be completed within 20 months after the signing of the contract. Many benefits are expected to accrue to Chili from the establishment of this line, as affording more ready communication with the markets of Europe and the Atlantic coast.

THE editor of the Waterbury (Conn.) *American* telegraphed the other day to Col. A. H. Fenn, at Plymouth: "Send us full particulars of the flood." Fenn replied: "You'll find them in Genesis."

## American Telegraph System.

To Col. Jas. Coleman, Superintendent W. U. Telegraph Company, Memphis:

Dear Sir: In what I have written regarding a system of Government control and ownership of the telegraph, I have endeavored to show that such interference would restrict, if it did not destroy, the freedom of the press, and through it the liberties of the people.

This system of Government ownership and management belonging to continental Europe, and more recently having been adopted in Great Britain, it is argued that the United States should copy the European model as tending to greater perfection, cheapness and promptitude in the delivery of messages. Looking at this argument in general, from an American or Republican standpoint, it would seem to be designed to excite our derision rather than our approbation. The very essence or basis of American politics is that the Government was designed and created for the benefit of the people. On the contrary, the European system has been that the people were born for the benefit of the Government and the nobles. It absorbed and attracted everything to itself and within its control—the press, education, the telegraph. Here private enterprise and associated effort effect the great ends of the public welfare. There the seal and stamp of Government despotism is seen in every department of industry and effort. What people have ever achieved more to elevate man and increase his comforts, his progress and his knowledge in a period less than a century, than the people of the United States?

In Europe the traveler is permitted to gaze upon magnificent and costly achievements of civilization. He passes from one wonder to another, until the mind is bewildered with the miracles presented to him. He sees art-galleries, cathedrals, castles, palaces, fabrics and monuments, which fill him with awe, or move him with delight. All is grand and colossal. The masses of mankind alone are dwarfed. They live in wretched hovels, eat coarse food, and wear the scantiest clothing. They labor wearily ten to twelve hours a day to gain a meager livelihood, with no hope ever to better their condition. Philosophers and political economists write folios of learned treatises upon the problem of ameliorating the condition of the laboring masses, without even touching upon the true cause of their wretchedness, which is that the end, aim and continual effort of a powerful Government is and has been for centuries, to fasten upon them the burdens, in order that the ruling castes and classes might enjoy the benefits of the system. Whatever advances may have been made in England, France and Prussia, the pendulum of inexorable despotism has continually oscillated back to this point, with the certainty of a physical law. Shall we look to these governments to furnish our models, when we have advanced so rapidly in real civilization?

Descending from great principles to particulars, it may safely be affirmed that, as the telegraph was invented, and achieved its first successes in the United States, so it has continued to maintain its superiority over all other countries on the globe, in the extent of its ramifications, the number of people whom it serves, the amount of information furnished, the promptitude in the delivery of messages, and the cheapness of its tariff. Let the reader note the contrast, brought to his mind by the following figures, between the boasted European system and that of the United States. Total number of messages transmitted on the continent of Europe for the year 1866, 12,902,538; gross receipts for the same, \$11,597,632.71; average cost of telegrams in continental Europe, 81 cents.

Total number of messages furnished to the newspapers

of the United States for 1866, 14,725,181; gross receipts for the same, \$521,509; average cost of press telegrams in United States, 3½ cents.

Here are the figures, showing that the telegraph in the United States, furnished two millions more of telegrams in one year, for the press alone, than the whole European telegraph does for all purposes, including the press, at a cost of one-twenty-fourth the amount received by the latter. Europe may boast of her ancient monuments, her architectural grandeur and her miracles of art, but after this startling exposition, she cannot lay claim to superiority in manipulating the lightning of Heaven for the enlightenment of mankind.

Yours, truly,

LEON TROUSDALE.

(For the JOURNAL OF THE TELEGRAPH.)

## How It Works.

## SCENE I.

Telegraph Office.—Enter excited levee contractor with two messages.

Contractor.—“Can I get these dispatches forwarded at once?”

Operator.—“Can not say, sir; wait a moment.” Calls distant station A, who answers.

Operator.—“G. M., A, ‘77.”

Station A.—“Wait till eight o’clock. Am testing lines.”

Operator.—“The dispatches are very important.”

No answer.

Contractor.—“The Board meets at eight o’clock. I wish them to take no action until I arrive; the contract involves four million dollars.”

Operator.—“Impossible to get them off before eight o’clock.”

Exit irate contractor anathema, epiphonema, etc.

Operator, don’t “13” get rule first by heart.

## SCENE II.

Time four P. M. Operator eating peanuts. Enter merchant.

Merchant.—“Here are three telegrams, the boats leave at five P. M. Can you send them at once?”

Operator checking messages.—“The lines are working magnificently; very powerful juice.”

Merchant.—“Young man, I don’t know anything about your ‘juice,’ unless you can send them at once I can not leave them.”

Operator calls distant station “A.”

“I i i i—‘11’ A,”

Merchant.—“Well.”

Operator.—“The line —.”

Merchant.—“Can’t you answer a simple question?”

Operator.—“I cannot promise positively, but will do my best.”

Merchant.—“I cannot sell the goods unless I am certain that they will be here to-morrow.”

Operator Solus.—“No where is the utility of electricity so practicably and beautifully shown, as in the rapidity and certainty with which we can communicate with distant points.”

RED STICK.

REMARKS.—That there is a vast amount of stupidity, or it may be better called thoughtlessness, on the part of subordinates in all classes of business there is ever abundant proof. No rules can reach such persons or guide them, because there are duties to which an intelligent discernment of the thing to be done alone can direct how best to act in their performance. There are others, however, so clear that neglect of them deserves the severest reprimand.

In the first of “Red Stick’s” scenes, no testing of lines would seem to be a proper excuse for refusing an important message from a way office. It seems to us that the fact of a message being in an office at all, should convey at once to the mind of a faithful and

thoughtful man that something of importance depended on its transmission, and that this consciousness alone would impel him to its reception. It requires, we are aware, a high moral tone always to argue in the interest of others. In the performance of telegraph duties this anxiety to meet the desires of others is the distinguishing trait of its best men. Such men alone are truly qualified for the business and on which its prosperity must depend. It is a measure of fidelity we sometimes believe to be oftenest found in small offices where there exists such an identity of interest in the community that the telegraph operator is a member of every family and every body’s friend. Be that as it may, we believe we are entirely correct in saying that—

1. The ordinary testing of lines should not be made during the hours assigned for public business.

2. That when an important message is announced at any time, there should be a prompt attempt to receive and deliver it.

In the case presented, A may have been compelled to test a wire so as to properly instruct a repairer awaiting orders, or he may have been assigned to that special service, and deemed its performance his first duty. Rule 1 does not give directions respecting opening lines for business, but merely for the reception of messages at offices.

The second case reads like simple insolence mixed with a very wooden apprehension of the rules in such cases. An operator eating peanuts and talking to an earnest man of business about “powerful juice,” is not likely to perform the duties of his office without offense. Nothing is clearer than that it is generally utter folly to promise more than careful attention to a message left. Especially is this true at a way office or at a main office respecting a way message. Nothing can make a promise of instant transmission proper at any time except such an absolute actual possession of the wire as to make it reasonable, and that possession can never be absolutely certain. The proper answer would have been: “I know of nothing to prevent your messages being sent in season, and will get them off as quickly as possible.” To promise more would have been folly and a breach of a highly proper rule. An absolute promise might have involved the company in litigation or damages. A falling tree, a broken pole, the shot of a rifle splitting the wire an instant after the promise, would have made transmission impossible.

## Electric Beacons.

MR. THOMAS STEVENSON, C.E., of Edinburgh, recently conducted an experiment at Granton with the view of showing the practicability of illuminating beacons and buoys at sea with the electric light, produced by means of a battery on shore. A submarine cable, fully half a mile in length, was laid between the east breakwater of Granton Harbor and the chain-pier at Trinity. The operator occupied a station near the center of the breakwater, and the light was shown at the point of the pier in front of an ordinary lighthouse reflector, producing a most brilliant flash. The flashes were emitted with great rapidity; as many as 500 can be transmitted in a minute, but the machine can be regulated so as to send one every second, or at any other desired interval. The experiment gave entire satisfaction.—*Mechanics’ Magazine*.

At a recent meeting of the Academy of Sciences at Vienna, Herr A. Waltenhofen read a paper on the limits of the magnetization of steel and iron. As a general result, he finds the potential temporary magnetization of iron to be about five times greater than that of the best steel.

STARTING from any of the different magnetic stations of natural forces, we can set every other in motion.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, OCTOBER 15, 1869.

### The August Report.

We have not deemed it our duty to refer to the official statements of the Company, which appear monthly in our columns, preferring that all information respecting them should be derived from the Company's officers. We venture a single word respecting the statement published to-day, to meet inquiries occasionally made of us, and in doing which our design is simply to indicate the causes which, with a greatly enlarged business, reduce the net result.

It will be seen that the cash receipts of the past August are over \$10,000 in excess of those of 1868. When it is remembered that this increase has been effected in the face of a largely reduced tariff, in not a few cases reduced below compensating rates by the necessities of opposition, it will show to all who intelligently study the history of the business that to accomplish the increase of receipts thus shown, at least a million of messages must have been added to the average of the past year. This increase has no doubt been caused, in part, by the reduction of rates which the Company has been introducing as rapidly as prudence permitted, but chiefly to the natural increase of a business which more and more entwines itself with the social and commercial necessities of the people. Its better, prompter, more skillful prosecution also, has so commended it to the public acceptance as, from this cause alone, largely to increase its use. Had the present year merely sustained the receipts of 1868, it would have shown a result, under the circumstances, sufficiently satisfactory. Future years must develop the capacities of the telegraph still more largely as population increases, and the people become educated to its use.

With an increase in the number of messages there follows, of necessity, increase of labor, and of men to perform it. This element of cost is always concealed by the advocates of low tariffs. The carrying of 1,000 letters by a railroad car is as easy as 100, but the transmission of two messages instead of one requires either twice the time, or double the force, and two wires instead of one. Thus no considerable increase in the number of messages can occur without added expense. The cost of this extra service during the past year cannot have been less than from \$60,000 to \$100,000.

To this the salaries or commissions at 500 new

offices opened during the year, where the receipts are as yet very small but rapidly increasing, must be added. Averaging these at only \$20 per month, the annual salaries at these new offices would be \$120,000 per annum. During the month of August also, the cost of maintaining offices through Oregon and Washington Territory to reach British Columbia during the past year have been settled, amounting to about \$8,000, thus increasing the legitimate expenses of the month over \$7,000. To all these items has to be added an increase of \$10,000 in the outlay for the reconstruction of lines which has been prosecuted with more than usual vigor during August.

It must be apparent, therefore, that the increased expenses are occasioned by entirely natural causes, although they appear as above the usual average. The fruit of much of this added outlay is yet to appear. Meanwhile the business widens, the lines multiply, and the property is enhanced in value.

### That Same Old Song.

The London *Times* is very severe on telegraph engineers who urge the building of lines at heavy cost under a specious use of figures and the old plea of the necessity of opposition lines for the public good, only to start a second on a cheaper scale and for like ends. But, says the *Times*, these gentry never issue the cheap prospectus, until the dear one is paid for. When found fault with, these clever electricians shrug their honest shoulders and say "yes, very bad for the old line, but consider the rapid progress of 'electric science!'" So under the plea of "the great march of improvement" which must not be confounded with the "rogues' march!" the work "goes bravely on." What a familiar song it is! We saw it last in a Canadian paper set to the words:

"Oh! the Snow, the beautiful Snow."

### Photographing Light.

It is well known that the method of receiving communications by the Atlantic and French cables is by the reflection of light upon an ivory scale from a small mirror on what may be termed the armature of the receiving magnet. Every movement of this tiny glass, causes the light reflected from it, to pass to the right or left on the ivory scale, these motions being indicative of letters, which the operator records. This seems to many a painful process. It has to be done in a dark room. It requires profound silence. It requires one person to read the evanescent characters thus given by a wandering ray of light, and another to note them down. The utmost attention by both is necessary. It seems to require such a concentration of mind as to be painful and full of hazard. Such is the impression conveyed to the general mind.

It is not wonderful, therefore, that many persons ask Cannot the cable be made to translate its messages on a permanent record? Cannot the light be made to leave such an impress on paper moving before it as to greatly facilitate the work of reception? Such a proposal was made to us a few days ago, which we could not do otherwise than acknowledge as desirable. We should not be surprised if that same person has

already a scheme to accomplish this in the Patent Office. That seems the first thought of an inventor. It is right enough. The brain has its rights of capital which we do not question.

To prevent folly, however, in any such supposed discoveries, and, it may be, to aid invention in this direction, we published in our last number an extract from an able article in the *Gentleman's Magazine*, on *Aurora Polaris*, showing how photography has been employed to perform a similar service in recording the magnetic movements of needles in the European observatories, during magnetic storms. Science seems busy on every hand devising processes to give certainty and precision to labor and discovery. Let inventors keep posted on the results already attained. It is a discouraging thing to discover that after much laborious thought and expense, a process is made public which is found to be the counterpart of another already in use. It is an ungracious task to be obliged to undeceive them.

By the aid of photography the feeblest motions of the most delicately poised machinery are now recorded in the observatories of Europe, and this process may yet be applied to recording messages by our great cables, unless mechanism, such as George Little's, with his delicate yet responsive floating pen, accomplish not only a direct record, but make possible automatic repetition in connection with our land lines.

### William H. Cody.

As we close this number for the press, we are sorry to have to announce the death of William H. Cody, of the Memphis Office, at 2 A. M., October 13th, at Hamilton, Ohio. No particulars accompany the announcement. Mr. Cody was a member of the Telegraphers' Mutual Life Insurance Association.

### Reduction of Rates.

From a number of exchanges, which reach us from all parts of the country, the new tariff seems to be received with universal satisfaction. It could scarcely be otherwise. Charging by air-line distances, so far as cost is concerned, gives every office in the country a direct line to every other. This, in very many cases, leads to large reductions, as the following table, taken from the *Saginaw Daily Enterprise* shows, and for the possession of which we are indebted to Mr. Alex. Ferguson, the manager there:

	OLD.	NEW.
New York.....	\$2 35	\$1 50
Detroit, Mich.....	85	65
Cleveland, Ohio.....	1 30	85
Toledo ".....	1 20	65
Philadelphia, Pa.....	2 40	1 50
Bangor, Me.....	3 00	2 10
Omaha, Neb.....	3 70	1 70
Salt Lake City, Utah.....	9 05	4 20
Boston, Mass.....	2 50	1 75
Washington, D. C.....	2 35	1 50
Buffalo, N. Y.....	1 65	1 10
Erie, Pa.....	1 50	1 00
Pittsburg, Pa.....	1 65	1 10
Chicago, Ill.....	1 60	1 00
Milwaukee, Wis.....	1 75	85
Cincinnati, Ohio.....	1 75	1 10
Jackson, Mich.....	85	55
St. Louis, Mo.....	2 25	1 30

Notwithstanding so many important reductions, the Company, satisfied with the general justice of the arrangement, are sanguine of its hearty acceptance by the people, and of an increased use of the wires under it.

MR. W. C. HAVENS has presented us with the sketch of a key for securing firm writing which, without trial, seems to secure, in a very simple way, that design. The connecting point is at the end of the lever instead of at the usual anvil, and connects just before the

hammer and anvil meet. The end of the lever being a spring, the contact is delayed, and the platinum points are preserved from mashing as at the anvil. No further description beyond a sketch of the key, thus modified, seems necessary.

### A Heavy Day's Work.

During Friday, September 24, 1869, the day of the great excitement in gold, the number of messages sent and received at the broker and central offices of the Western Union Telegraph Company was as follows:

Gold Board office, . . . . .	1,754
Stock Board office, . . . . .	426
Corn Exchange office, . . . . .	300
Pearl street office, . . . . .	502
. . . . .	255
Broad street offices, . . . . .	1,160
Pine street offices, . . . . .	264
General office, 145 Broadway, . . . . .	11,001
City Department, . . . . .	3,149
Total, . . . . .	18,811

These messages were left at the various offices at the rate of about fifty messages per minute.

### Correction.

The article headed "Monopolies" in our last issue should have been credited to the Albany *Evening Journal*. The omission of a word gave the article local significance, to the disturbance of some worthy gentlemen who deem themselves, as yet, ungobbled. The Atlantic and Pacific States Telegraph Co., was an organization in California. The omission of the word "States" caused the article to announce the evaporation of the Atlantic and Pacific Telegraph Co., which, we are confidentially informed, "still lives."

A few copies still remain of the second edition of Pope's Manual, which those who desire this excellent work had better make haste to secure.

A series of letters by Leon Trousdale, of Memphis, Tenn., a Southern writer of some distinction, on the subject of the American telegraph system have been sent us, and which we cordially transfer to our columns as nearly complete as our space permits.

They are addressed to Superintendent Coleman with a few words of personal compliment, as graceful as they are merited. The letters themselves are well worth perusal, and have in them the warmth of treatment peculiar to Southern literature. We have here and there taken liberties with the text as it strayed into the fields of past contests which we desire to do our share to bury and obliterate, but we believe we have done so without harm to their vigor. It would be well were other pens to imitate Mr. Trousdale, in protesting against projects so un-American and destructive.

## OFFICIAL STATEMENT.

### Western Union Telegraph Company.

	Aug. 1869.	Aug. 1868.
Total Receipts.....	\$612,517 47	\$602,304 73
Total Expenses.....	407,990 89	376,452 03
Net Profits.....	\$204,526 58	\$225,852 70

## TARIFF BUREAU.

### Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
OCTOBER 15, 1869.

#### To all Offices on W. U. Lines:

The following changes in tariff have occurred since October 1st, the date of the last tariff order. Please note them in your tariff book. Be careful not to enter the names of those offices which may be found already printed in the book:

#### NEW OFFICES.

21 Ashland, Mass.	202 Lockbourne, O.
* Blair, Iowa.	398 Lakenan, Mo.
* Cornwall, Lebanon Co., Pa.	60 Milford, Del.
151 Canonsburg, Pa.	217 Madison, Ga.
263 Coffin's Station, Ind.	* Mt. Carbon, Ill.
Fort Bridger, Wy., tariff	369 O'Fallons, Mo.
2,50 more than Omaha,	398 Round Grove, Mo.
Neb.	831 Rensai, Miss.
403 Girard, La.	357 Summit, Knox Co., Ill.
* Grand Tower, Ill.	275 Scottsboro, Ala.
455 Hamburg, Iowa.	331 Tupelo, Miss.
321 Henderson, Tenn.	32 Ware, Mass.
407 Malcolm, Iowa.	222 Yellow Springs, O.

#### OFFICES OPENED ON OTHER LINES.

##### To be entered in Part II:

Blair, Iowa.....	35 2	Mo. Valley Junction, Iowa.
Cornwall, Lebanon Co., Pa..	55 4	Philadelphia or Harrisburg
		which ever is the cheaper.
Grand Tower, Ill.....	50 5	Carbondale, Ill.
Mt. Carbon, Ill.....	35 3	" "

#### OFFICES CLOSED.

Allegheny Springs, Va.
Coalport, N. J. Business will hereafter be sent and checked to Bordentown, N. J.
Duxbury, Mass.
Ironton, Mo.
Townsend, Del. Send and check business to Middletown, Del.
Zilwaukee, Mich.

#### GENERAL INFORMATION.

Until further notice Hudson City, N. J., will be checked at rate given in new tariff book and not by square rate as per last JOURNAL.

The following changes in tariff of Other Lines from Missouri Valley Junction, Iowa, have been made:

Onawa, Iowa.....	40 3
River Sioux, Iowa.....	35 2
Sioux City, Iowa.....	60 4

Offices having business for Perth Amboy, N. J., will collect 25c. for delivery charges from South Amboy, and send and check to the latter office.

The name of the office heretofore known as Storey Farm, Pa., has been changed to Columbia, Venango Co., Pa.; and Elmhurst, Ill., formerly Cottage Hill, has been changed to Cottage Hill, Ill.

The tariff to Champion, Mich., is incorrectly given in some of the books. It should be 2.00 and 11, Chicago, in all Districts but A, O and Pacific Division. In these books it is correct.

The correct tariff to Leicester, Mass., is 15 and 1 from Worcester.

The correct tariff to Los Vegas, New Mexico, from Districts B to O, inclusive, is 2.25 and 22 from Denver, and from District A and Pacific Division 2.40 and 16 from Denver.

Olathe, Mo., in last JOURNAL should read Olathe, Neb.

Pleasant Valley, O., should be in square 212 instead of 181.

It has been decided that on and after October 15, 1869, the use of the "square rate" to the points named below on the Albany and Susquehanna R. R. will be discontinued, and the rates made by adding to rate to Albany or Binghamton the amounts stated below, and that the lowest rate will be the tariff. The offices will be checked direct as heretofore:

	From Albany.	From Binghamton.
Afton, N. Y.....	40 3	30 3
Bainbridge, N. Y.....	40 3	30 3
Central Bridge, N. Y.....	35 3	50 3
Cobleskill, N. Y.....	35 3	50 3
Colliers, N. Y.....	40 3	40 3
Esperance, N. Y.....	30 3	50 3
East Worcester, N. Y.....	35 3	50 3
Harpersville, N. Y.....	40 3	30 3
Knowersville, N. Y.....	30 3	50 3
Maryland, N. Y.....	40 3	40 3
North Scotland, N. Y.....	30 3	50 3
Oneonta, N. Y.....	40 3	40 3
Otego, N. Y.....	40 3	35 3
Port Crane, N. Y.....	40 3	30 3
Quaker Station, N. Y.....	30 3	50 3
Richmondville, N. Y.....	35 3	50 3
Schenenuss, N. Y.....	40 3	40 3
Sidney, N. Y.....	40 3	35 3
Tunnel, N. Y.....	40 3	30 3
Unadilla, N. Y.....	40 3	35 3
Worcester, N. Y.....	40 3	40 3

WILLIAM ORTON, President.

### Sharp and Saucy.

Two managers in the oil regions have had a discussion on checks. One of them evidently regards check inquiries very much of a bore, and don't care much for examination. The other is as intent on a square settlement all round and so sends his little check sheet to his confrere, showing checks against him for 59 cts. and \$1.83, and very pertinently and laconically asks:

"How do you make \$2.92?"

To this his amiable but disgusted co-laborer replies with equal laconicity and snap:

"We usually work for it!"

Which, of course, was gratifying and satisfactory.

A few days after this pleasant correspondence, the same parties again enter into communication with each other. Our particular manager finds his June account out of sorts, and hails his brother manager in the oil regions as follows:

"Please send me address, date, signature and check of messages against me in June"

To this the following extremely indignant and spirituous reply was given, which probably ended the correspondence, and must have been penned in a high state of disgust.

"You must have awful whisky at your place. Don't trouble me with this d-d thing again or I will be compelled to report your incompetency to the Superintendent. If you can't get your account for June to "jibe," you had better transmit 50 cents to the general office!"

OFFICES having Tariff Books marked B, C, D, E, F, G, H, are again reminded that the tariff from their offices to any offices 75 miles or under is as follows:

25 cents for 25 miles or under.

30 cents for 50 miles or over 25.

35 cents for 75 miles or over 50.

Those having books J, K, L, M and O will collect 35, 45 and 55 for same distances, respectively.

### The French Cable.

The conditions under which the French Transatlantic Cable was allowed to be landed on the American shores are, it is well known, provisional. Our Government, with the consent of MM. Erlanger and Reuter, reserved to Congress the right of suspending or putting an end to the authorization. The eventuality which dictated this prudent provision has arisen, as you will see by the following correspondence:

*"To His Excellency M. Forcade de la Roquette.*

*Minister of the Interior:*

The undersigned, citizens of the United States, for themselves and their associates, promoters of the United States Continental Telegraph Company, respectfully state that they are desirous of laying a cable between some point on the coast of the United States and some point on the coast of France, and they now ask your Excellency to grant to them permission to land and operate the said cable under the usual restrictions. The undersigned respectfully ask the early consideration of this request, and that the decision of your Excellency shall be forwarded to the care of the United States Legation, Paris.

The undersigned have the honor to be your Excellency's obedient servants."

This application was signed by two retired Generals and a Major of the United States Volunteers and regular army, and by another American gentleman holding a prominent position abroad. The amount necessary to be deposited, on receiving the authorization, was subscribed, and all the usual forms complied with. The reply received from the Minister was to the effect that an exclusive privilege to land a cable having been granted MM. Erlanger and Reuter, the latter request could not be accorded.

A memorial has been addressed to the State Department in Washington, embracing copies of these letters, and demanding of our Government to suspend the authorization granted to MM. Erlanger and Reuter to work their cable, until the French authorities concede a similar privilege to the memorialists. It is urged, that the *concessionaires* of the French monopoly were bitterly hostile to the North during the rebellion, and that they have no claim to any special indulgence from the United States even under the terms of the authority granted to them to land their cable. If Mr. Fish does not take any notice of the memorial it is to be hoped that Congress will, for it would be a crying injustice to allow the authorization to stand good against the right of our citizens to the enjoyment of a similar authorization from the French Government.—*New York Times.*

### Electricity the Vital Force.

The science of chemistry has done much of late to define the character of the subtle elements of nature, yet there remains much undefined and probably undefinable. A controversy has existed for a long time between physiologists and electricians as to the nature of the vital force of the animal economy. While the latter contend this force is but a condition of electricity, the former deny the identity of the two.

It is an admitted fact that there is a vital principle pervading every species and variety of the animal kingdom, without which it could not exist. Our object is not only to show the analogy existing between it and common electricity, but further to prove the identity of the two. This power is so distinctively defined in some of the lower animals, that there can be no mistaking its identity. Several species of fishes are now known to scientific men to possess electrical power to a remarkable degree.

The Torpedo is a fish of enormous muscular and nervous power, having incorporated in his body a well-defined battery capable of emitting tremendous shocks. The Gymnotus or American Eel, is from five to six feet long, and the most powerful electric fish yet discovered. This dread monster of the deep coils himself up in the mud, and gathers around him a school of

small fishes. By his electric discharge he renders them powerless and devours them at pleasure.

The eel is constructed upon the plan of the Voltaic battery or pile. He has ninety-six series of tubes or piles arranged horizontally from head to tail. These tubes contain an albuminous fluid, highly saturated with saline matter. This natural animal battery is connected with bundles of nerves proceeding from the brain; and distributed throughout the electrical apparatus in multitudinous ramifications. Ordinarily this fish presents no more signs of electricity than a Voltaic battery, at rest; but when it is excited its power seems almost unlimited. Then a full grasp by the hand of the monster has been known to destroy human life, and even the horse has been killed by its voluntary shocks. A close inspection of the physiological structure of man discloses a perfect Voltaic battery or pile. And the arrangement of its solids and fluids is peculiarly fitted to the generation and discharge of electricity. To the brain, spinal cord, and great sympathetic may be traced the source of electrical power. The brain is the prime battery or reservoir of electro-magnetism, excited at the pleasure of the voluntary mind. By means of the multitudinous ramification of nerves, a perfect system of telegraphing is established throughout the entire organism. These nerves, both the motor and sensitive, polarize, with the brain, producing direct and reflex action. Through this medium, both motion and sensation are communicated.

It is in fact the direct source of all mental operations, familiarizing man with the world of things and phenomena. The proofs in reference to man's electrical identity are so incontrovertible, that no intelligent physiologist or naturalist, can doubt that the vital force of the body is electricity. It is a demonstrable fact that currents of electricity are constantly passing from the human system. So strikingly is this illustrated, that in some instances, a grasp of the hand will transmit an electric shock perceptible to the elbow. A positive hand laid on a negative brain, is frequently unbearable, causing a sensation similar to that made by an electric machine. The sparks, external, and the crackling of the body so perceptible at times, are but electrical phenomena. This vital principle is so identified in certain persons that gas will ignite by contact with the tips of their fingers. The same illumination can be accomplished by every one if insulated and charged with electricity; which only increases the volume of that already in the body. Further proof is given in paralysis or loss of power in the limbs, which can be traced to an absence of the vital force. In this connection if the paralyzed organ be placed in an electric circuit, its vitality is re-established. No stronger proof can be given of their sameness, than in the direct substitution of one for the other.

### Electro-Heating Apparatus.

An invention for heating purposes, patented March 12, 1869, is based upon the well-known fact that electricity, in passing through a conductor of insufficient capacity (such, for instance, as a wire of very small diameter), evolves or develops heat. It is also well known that a wire of any great length, and of sufficiently small size to evolve considerable heat, will not conduct a strong current of electricity without difficulty and loss, and that as the wire becomes heated, its non-conductivity is increased, and that, in consequence, the heat becomes so great that the wire will be fused.

The object of the invention is to obviate this difficulty by enabling a strong current of electricity, to pass through a heat-evolving apparatus of any length; and to this end it consists in providing an electrical

conducting coil, or chain, with intervals of small conducting power, in traversing which the electricity will be caused to evolve heat; and further, in interposing between said obstructing intervals, free conductors of much larger size, which constitute reservoirs of electricity, and radiators of heat, and will effectually obviate the difficulty experienced in a continuous length of conductor of insufficient capacity.

In the application of the invention, for railway carriages or cars, it is proposed to employ magneto-electric machines, constructed especially for this purpose, for producing the requisite current, placed, if necessary; under the car, and to obtain the power to operate them from the axle of the car—thus taking advantage of a motive power which already exists, but of which, heretofore, no use had been made.

A machine capable of heating to incandescence one foot of platinum wire one tenth of an inch diameter, will heat one hundred feet one hundredth of an inch; two hundred feet, two hundredths of an inch, etc.; the law being that the lengths of the wires vary inversely in proportion to the squares of their diameters. Now to reduce this to practice, it will be seen that a machine or battery of the power above referred to will heat a length of coil or chain, in which the aggregate length of the small wire of one-hundredth of an inch diameter, forming the obstructions, is one hundred feet; and two hundred feet, if their diameters are reduced one half, etc. In other words, having a machine of a certain power and a certain degree of heat is required, the diameters of the obstructing media may be reduced or increased in order to accommodate them to the power of the machine.

In order to warm an American car upon this plan, allowing for a tray placed in the floor of the car, in front of each seat, it is estimated it would require an entire length of chain or coil of about three hundred and sixty feet, and in which the obstructing media form an aggregate length of about seventy feet; so that to accomplish this it would require a machine to heat this latter number of feet of small wire.

### Recent Scientific Discoveries.

#### ELECTRIC ALARMS FOR VARIATIONS OF TEMPERATURE.

It is in many cases—notably in some stoving operations and in the management of hot-houses—very desirable to have warning when the temperature rises above or falls below a certain heat. A rise of temperature is easily made known by what may be called a maximum thermometer-alarm, a well-known instrument, which is made by carrying one platinum wire in connection with a battery and bell into the bulb of a mercurial thermometer, and another wire down the tube to the degree it is not desired to exceed. When the mercury rises to this point the circuit is completed, and notice is given by the ringing of the bell. But an instrument to give warning of a fall of temperature is new to us, and we borrow a description of it from the account of MM. Besson & Kneider, who have contrived it. It consists of a spirit thermometer, the bulb of which is placed above, and the tube curved in a U shape. A platinum wire is carried into the bulb and down to the degree of heat it is wished to notify. Below this minimum the curvature is filled with mercury, which is in free communication with a second platinum wire. As the alcohol contracts with the cold the mercury will, of course, rise, and reaching the first platinum wire complete the circuit and give the warning. One bell and the same battery will serve for the two thermometers; but it will be necessary to interpose a commutator to ascertain through which circuit the current is passing and whether a rise or fall is indicated when the bell is rung.

THE more we discover, the more infinite appears the range of the undiscovered!

## American Institute Fair.

There is a very meagre exhibition of telegraphic apparatus at the Institute. The exhibitors in this department are Charles Williams, Jr., Boston, William E. Davis, of Jersey City; Dr. Bradley, and the American Compound Wire Company. All these are characteristic, and need no commendation from us. Dr. Bradley exhibits an electro-magnetic clock, of much ingenuity. But we must delay enlarged notice of all these to another issue.

## Condensation of Magnetism.

In the *Comtes Rendus* of Paris, M. Janin describes a mode of condensing magnetism. He had made a horseshoe-shaped magnet composed of ten bars of perfectly homogeneous steel, and fastened together by means of bolts. When properly magnetized, it is capable of bearing a weight of 660 pounds at the armature. When the armature is so placed as to be in contact with only one of the steel bars composing the horseshoe, it appears that the magnetism of the nine other bars is very perceptibly diminished. Under these conditions, and notwithstanding the magnet was previously saturated with magnetism, it is possible to saturate anew with magnetism and make the horseshoe bear double the weight, or 1,320 pounds. This experiment can be repeated; another armature may be put on, so as to bear on only one of the component bars, and again more magnetism can be condensed. In this manner the author has already succeeded in making the horseshoe bear another 1,320 pounds.

## Married.

On the 22d inst., at Palmyra, Mo., at the residence of Mr. John Bosley, by Eld. J. S. Green, Mr. G. M. HOHL, and Miss MILDRED G. BOSLEY, both of that city.

In Newark Valley, N. Y., Sept 21st, 1869, at the residence of the bride's parents, by the Rev. J. K. Peck, Mr. OSSIAN DIMMICK, Manager of the Western Union Telegraph Office at that place, to Miss LEZZIE YOUNG, both of Newark Valley.

FRANK L. POPE,  
TELEGRAPHIC AND ELECTRICAL ENGINEER,  
Nos. 78 and 80 Broadway, Room 48,  
NEW YORK.

## AMERICAN FIRE ALARM

AND

POLICE TELEGRAPH.

GAMEWELL &amp; CO., PROPRIETORS.

NO. 104 CENTRE STREET, NEW YORK.

This system of Fire Alarm Telegraph, with a central office, or upon the

## AUTOMATIC PLAN,

is now in operation in the following cities, to which reference is made for evidence of its great SUPERIORITY AND VALUE, and UNIFORM reliability:

BOSTON,	PORTLAND,
CHICAGO,	ST. JOHN, N. B.,
PHILADELPHIA,	HARTFORD,
CINCINNATI,	TROT,
ST. LOUIS,	NEW HAVEN,
BUFFALO,	ROCHESTER,
BALTIMORE,	SPRINGFIELD,
MOBILE,	TOLEDO,
NEW ORLEANS,	ALBANY,
PITTSBURG,	COLUMBUS,
LOUISVILLE,	LAWRENCE,
ALLEGHENY,	MILWAUKEE,
MONTREAL,	SAN FRANCISCO,
QUEBEC,	CAMBRIDGE,

WASHINGTON, D. C.

The distinctive features of

## THE AMERICAN FIRE ALARM TELEGRAPH

are a Combination of Circuits, the Automatic Signal Boxes, Electro-Mechanical Bell and Gong Strikers.

THE AMERICAN FIRE ALARM AND POLICE TELEGRAPH is covered by some twenty patents. Very early after its introduction into Boston, GAMEWELL & Co. purchased the original patents of FARMER & CHANNING, and during the past fifteen years have spared no expense or pains to improve and perfect this system.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

## THE STANDARD

AMERICAN WORK ON THE TELEGRAPH.

MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed.

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUGH, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT SAEVING.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—*The Telegrapher*.

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—*London Mechanics' Magazine*.

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—*Journal of the Telegraph*.

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPH, or RUSSELL BROTHERS,

PUBLISHERS,

28, 30, 32 Centre Street.

# Journal of the Telegraph.

## The Conductors of Sound.

The air is one medium by which sound is conveyed. But solid bodies convey sounds much better than the air; this fact you may readily prove by placing your ear flat and close upon the end of a long table or a marble chimney-piece, and asking another person to scratch or rap gently with a pin or other body at the other extremity. It is very curious to note how you can thus appreciate the sound produced by the most delicate impulse. Now lift your ear from the table and raise it only two inches, and you can with difficulty distinguish the slightest sound. Solid bodies then are better conductors of sounds than the air; and moreover they convey them with a far greater velocity, as has been proved by the following curious experiment:—"A metallic wire 600 feet long was stretched horizontally, and at one end a plate of sonorous metal was attached; when the plate was slightly struck, a person at the opposite end, holding the wire in his teeth, heard at every blow two distinct sounds, the first transmitted almost simultaneously by the metal, the other arriving later through the air." . . . But sound is also communicated by liquids: water is an admirable conductor of sound, and though not so good a one as hard and elastic bodies, it is far superior to air. If you have any doubt of this fact let me recommend you to dive down into some pond or river, and take two stones or pebbles from the bottom and knock them together several times in succession. How loud the sound seems! Now come to the surface, and after taking breath take a couple of quoits down with you, and strike them together close to your ear. Why, the noise is almost deafening; and you are satisfied that water is an excellent conductor of sound. Now let me ask you to try the effect of sound proceeding from the rarer medium of air into the denser one of water. Ask your friend on the river bank, to strike these same quoits together, while you are under the water. "Did you hear anything?" "Not a sound of any kind," you will reply. Ask him to halloo and shout with all his might. "Could you distinguish any noise?" "I thought I could just recognise a feeble and confused sound as if it proceeded from a great distance." "Perhaps so—but your head was not more than three or four feet beneath the surface; if you will sink down a few feet deeper, you will not hear the slightest indication of a sound."

## Sewing by Electricity.

For many years it has been a query whether the electric current might not be brought so far under man's control as to take the place of steam as a motor for machinery, and success has at last crowned the preserving efforts of scientists. There may be seen at the exhibition of machine arts now open in New York, on the left hand side, about midway of the center aisle, an elliptic lock-stitch sewing machine driven by a small electric engine which might easily be put into a common hat box. A series of eight magnets are set on the periphery of a circle and around these revolves an armature of steel, which is continuously propelled by the magnetic action, and thus operates the machinery that moves the needle. Connection with this motor is had by means of a small slide within easy reach of the operator, at whose will the current may be cut off entirely, or the speed of the needle graduated, as may be desired. The use of this motor, if it becomes general, can not fail to prove of the utmost benefit to ladies, especially to machine operators, as it does away entirely with the necessity for using the feet, as is now the case, and must be highly conducive to the health of females, who suffer from many diseases that are generated by the constant strain on the pedal and limb muscles. The inventor of the engine in question is Chas. Gaume, and the exhibitor, H. C. Covert, of this city.

## STICKWELL & CO.'S

EXTRA MUCILAGE  
THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

Stickwell's Mucilage is KING of the Market. No other brand sells as well.

IN QUARTS, PINTS, SOZ. CONE, SOZ. FLAT, SOZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor.

## SPECIAL NOTICE

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

**Telegraphers'****Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postage, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers' labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

38 SOUTH FOURTH STREET, PHILADELPHIA.

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH,

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

**THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

**GREAT AND UNIFORM STRENGTH,**

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET, PHILADELPHIA.

The guarantees of this insulator are :

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

NEW YORK, NOVEMBER 1, 1869.

WHOLE NO. 48.

## Everitt's Acoustic Telegraph.

A series of experiments with the newly-invented Acoustic Telegraph were made on Thursday last, at the Fulton Ferry House, Brooklyn, in the presence of a number of gentlemen, who were as much astonished as gratified at the accuracy of the general messages that were transmitted by the acoustic telegraph through wires connecting two houses 150 yards from each other. The first message sent was that of the Rev. Dr. Deems: "He that hath ears to hear, let him hear." The Rev. Dr. Hall asked: "How long before the new bridge is to be built, and what about stock in it?" Mr. Samuel Orchard inquired: "Can a man be held responsible for the place of his birth without having been consulted by his parents?" *The Tribune* reporter asked: "What is the time at the ferry?" and Dr. Boscowitz inquired "the relative diagnosis between rubola and scarlatina." These messages were all transmitted safely and much more accurately rendered than ever could be anticipated. The invention is a battery that works without electricity, through a wire that does not call for the protection of insulators, nor tall, massive poles, and that delivers a message through wire, of any length, one-eighth of an inch in diameter, submerged in water, buried in the ground, or suspended in the air. The battery consists of a solid iron cylinder one foot long or more, and four inches in diameter in facial and general, but toward the other end, which becomes conical and tapers like a Minie ball, is an aperture, admitting the entrance of a metallic wire, the medium of communication, the whole supported by solid iron frame-work, and weighing not more than 100 pounds. At the facial end of the cylinder is a hollow hemisphere of iron, whose interior surface is covered with silver plate, constituting an elliptical mirror, having a solid rim one inch in diameter. The face of this rim is ground so smooth that when it is placed in contact with the face of the cylinder, no air can intervene, and it is held and kept in this position by a strong spring twelve inches long, arched above and supported by the frame work, and curved below, so as to form the signal key by which the battery is worked, and made to evolve sounds from the organic atoms of the air which surround and press upon the fan of the rim and of the cylinder with a force equal to fifteen pounds on the square inch, the moment one face is separated from the other. The distance of this separation is graduated by two metallic bars, which constitute the Diatomic Staff, and from each bar a different order of sound is created called the vowel and the consonant sounds respectively. By uniting in regular order the first and second order of sounds, the Fulcimen or third order is produced. By uniting the second and first order, the Bifulcimen or fourth order is generated, and in commingling together the first and second primary orders, the Valorem or fifth order of sound is created, and together they represent and express, under specific symbolic formula of sounds, each letter of the English Alphabet, and each Arabic Notation; and each one is so characteristic and expressive of itself that no mistake can occur in translating a message.

The inventor is Dr. Lancelot Hope Everitt of New Orleans, La., who was elected a member of the Royal College of Surgeons in Edinburg some years ago. The Doctor's theory is that sound is a triune molecule of matter, silent inertia, impulsive force, and explosive sound, and exists in all the organic atoms of the world. That he can evolve these molecules from the organic atoms of the air in such a way, by means of his Acoustic Battery, as to collect them into two dissimilar units of sound, which he converts into two primary orders. When thus evolved the hemispheric mirror reflects them through the solid cylinder, which then inducts them into the cone of the wire, through which it passes with great velocity to the distant end of the wire. This end is all the time in contact with a glass bell made for the purpose. When a message is about being sent, a tattoo is sounded by the battery and this rings the bell so loud you can hear it 20 feet off. The message then follows in symbolic order, and as they chime their intonations upon the bell they are easily interpreted by the receiver of the message.—*N. Y. Tribune*.

## French Military Telegraphs.

M. Fix has just published a treatise on the subject of Military Telegraphs in which he admits that up to 1868, the French were far behind the English and Americans, the Germans and Italians in the adaptation of telegraphic apparatus to the purposes of war.

M. Fix cites the growing use of cable lines by corporations to connect places between which air lines would be much exposed, and claims that thought must now be given to the employment of light cables for field purposes. With these and a modification of the Morse instrument, or that instrument as ordinarily used, and light portable stations, the lines to be chiefly used in connecting the different corps with headquarters, and the cable consisting of a good sized iron core, he proposes several plans by which to perfect the use of the telegraph on the field.

M. Fix seems exceedingly disgusted at the employment of civilians as telegraph managers and operators, and recommends their dismissal and the whole work to be assigned to properly trained soldiers, and under the charge of the general staff officers. This the English government also proposes, not only in the field service, but for ordinary government uses. In one of the recent reviews at the camp of Chalons, M. Fix used a seven-wire cable pressed to ribbon form, to advantage. He thinks the telegraph highly important as an aid to strategy, but says its use should stop in actual battle, where it becomes more troublesome than useful.

In spite of all the conquests of critical philosophy, we cannot forget that thunder is a manifestation of the great forces which govern the world. When it causes the powerful voice to be heard, we feel as if our pride should bend its head. How can we forget, indeed, when we hear the sound of this celestial music, the mightiness of the hidden causes, in the midst of which we pass our troubled and ephemeral existence.

## THE BELGIUM TELEGRAPHS.

TRANSLATED FROM THE ANNALES DU GENIE CIVIL.

BY GEORGE B. PRESCOTT.

### THE WIRE.

In Belgium nearly all the telegraph lines are of aerial construction, that is to say, suspended upon poles. The wires insulated by an envelope of a non-conducting material, are only employed in exceptional cases, for example, through cities, tunnels and under water. The conductors which have been used in past years are of iron, of number 8 and 11 Birmingham gauge. Some of the constructors have maintained, as the result of an experience of more than ten years, that there is an advantage in point of duration to substitute the galvanization of the wires by an increase of diameter corresponding in expense to the cost of zincage. This substitution presents besides, the substantial advantage of an increase in the conductivity of the wire and the lessened risk of breaking. The Belgian administration is now giving the subject a trial. The conductors put in service within two years are composed of iron wires of numbers 6 and 8 gauge, ungalvanized. The wire of number 8 gauge is employed upon the lines of the interior service, and the wire of number 6 gauge is used upon the international lines. All the lines established along the railroads are composed of galvanized iron wire of number 11 gauge.

Formerly the joining of the wires was accomplished by placing the extremities in juxtaposition upon a length of 6 or 8 inches, and twisting them together between two vises, one turned in one direction and the other in the opposite. A solder, formed of an alloy of lead and tin, was applied to the joint to assure the conductivity of the conductor by preventing the rusting of the parts in contact, or the penetration of foreign substances between the ends of the wires. This manner of making the joint has the advantage of re-uniting the wires a great many times, but on the contrary it possesses the disadvantage of materially weakening them and making them more likely to break. Experience has demonstrated that the breaks from changes in temperature occur at the joints. This system cannot, besides, be employed upon wires of small diameter, and which have been sufficiently annealed. These considerations have caused the abandonment of this manner of making the joint, and of the adoption of the style of jointing in use in England and in the Northern and Eastern portions of the United States. The middle of the joint is soldered, after being cleansed, which is done with a solution of chloride of zinc. If the wires are not galvanized they complete their junction by winding the joint with small copper wire and solder both ends of it. This process of joining the wires has been in practice over six years and has given the best results. It has been applied to the wires of number 6 gauge, and to those of the smaller size. It offers all the guaranties of solidity that can be desired. When

the turns or spirals are firm and of a sufficient number, the strength and conductivity is as great at the joint as elsewhere. The solder and the wire wound around the joint prevent any cause of resistance to the passage of the current. Certain administrations found the best results so far as conductivity and strength are concerned, in the following arrangement: They place the two ends of the wire in juxtaposition, after having bent around the extremities in the form of a hook; they are then bound together firmly by means of a small iron wire, which is wound in all the intervening space between the two hooks; they then plunge the whole in a bath of solder. This plan requires a good deal of time and care and offers difficulties of a practical nature in soldering.

The system of jointing the wires employed in France appears to form a very good contact, and renders the line sufficiently strong. It is composed of a hollow cylinder of galvanized iron, provided with an opening upon one of the sides. They place the wires in the short tube or cylinder and turn the extremities in the form of a hook, and pour solder into the opening. This process is the invention of Inspector Baron.

#### THE POLES.

The poles employed to support the wires are of pine, spruce or larch, and injected with sulphate of copper after the Boucherie process.

Poles injected by this process in 1850 still remain in a state of preservation, and we are enabled to give as the duration of poles prepared in this manner a period of at least twenty years. Resinous woods are preferred, because they are more easily prepared, are cheaper and more uniform in size. Poles are furnished by contract and are generally delivered with the bark taken off at the wood yard, where they receive the preparation of sulphate of copper. The preparation of the poles are ordinarily made from the first of May to the first of December. The trees cut from the month of December to the month of March, when they are filled with sap, can be injected a long time after they are cut, but the hardening of the preserving fluid which is ordinarily occasioned by the cold winter weather, prevents their being injected in the open air during this season. The expenses valued by cubic yard of wood are as follows:

Sulphate of Copper.....	\$1 53
Labor.....	1 90
Cost of the Wood.....	8 68

Total cost per cubic yard.....\$12 11

The cost is less than in 1862 and 1863. The price of wood, which had increased up to 1863, had diminished in 1864 and 1865. There was also a reduction in the general expenses and in the price of sulphate of copper. The sum paid for salaries differed very little from the price paid now. Five hundred and ninety-five cubic yards of wood were prepared in 1865, the total expense of which was \$7,212.40—\$5,164.60 being the cost of the wood, and \$2,047.80 the cost of the preparation. The general expenses, therefore, are but slightly increased. The capital invested in the work of preparation of the wood for this purpose is only \$800. The facility with which the preparation of the poles can be done by the Boucherie process at the wood yards, or even at the place where the trees are cut, renders this system very convenient in practice. The cost of preparation varies in different countries only according to the quantity of sulphate of copper absorbed and the price of labor. In France M. Blavier, in his *Traité de Telegraphie* of 1867, estimates as follows per cubic yard:

Sulphate of Copper.....	\$1 44
Labor.....	80
General Expenses.....	50

Total expenses per cubic yard.....\$2 74

The quantity of sulphate of copper injected is much less in France than in Belgium. The results obtained in Prussia are similar to ours, as we gather from the work of M. Rother published in 1865.

Among the substances besides sulphate of copper, utilized for the preservation of wood, is creosote, obtained by the distillation of gas tar, which in Belgium is employed upon spruce ties used upon the State railroads, and is very much used in England for the preservation of telegraph poles. The Belgian government had a certain quantity of poles prepared with creosote in 1861, 1862 and 1863, in order to determine its value as compared to the other process. These poles were furnished by contract at the wood yard and were submitted to the creosote process. The expense of preparation varied from \$4.00 per cubic yard in 1861 to \$3.45 in the two following years. They were a little less than the cost of the Boucherie process for the same year.

The planting of these poles is too recent to compare their results accurately, but we can, notwithstanding, foresee that they will be equal at least to the Boucherie process in point of durability. The considerations offered for the general use of creosote are more than surmounted by the objections which exist to its use, as this substance exercises a corrosive action upon all organic matter and renders the handling of the poles very inconvenient. It burns the clothes of the workmen and blisters their hands and faces. Poles freshly prepared by this process emit a very offensive odor, which renders them unfit to be placed near houses, and although these inconveniences disappear after the poles have been exposed two or three months to the air, yet on account of these practical objections the government has given up the use of creosote. We conclude the report of this operation by remarking that in Prussia the quantity of creosote injected per cubic yard of wood is about 408 pounds. The cost of preparation was \$6.76.

The process of injecting with sulphate of copper, by permeation in a close vessel, has been tested by the administration. 600 poles were prepared by this system in 1864, and 3,000 in 1865. As in the case of the creosoting, the furnishing of the poles, with the bark taken off, was done by public contract. The injection has been done by contract at Gand. The operation is practically the same as that of creosoting. We cite the principal clauses of the contract subscribed by the contractor in 1864:

The preparation consists in the injection by means of a vacuum, and of pressure of a solution of sulphate of copper, of which the strength varies between the limits of 3,000 to 5,000 pounds of sulphate of copper to 28,000 gallons of water; the strength comprised between these limits averages about 4,000 pounds to 28,000 gallons. The minimum weight of sulphate of copper which is allowed per pole is as follows:

Per pole, No. 2, 688 pounds.	Per pole, No. 6, 1,684 pounds.
3,826 "	7,194 "
4,966 "	8,240 "

The temperature of the liquid must be 50° centigrade. The quality of the sulphate of copper must be verified.

The results of the preparation of 1865 are as follows:

Number of the Poles.	Price of the Wood.	Cost of Preparation.	Total net Cost.
2	.65	.26	.91
3	.73	.32	1.05
4	.88	.37	1.25
6	1.20	.65	1.85
7	1.40	.74	2.14
8	1.90	.90	2.80

The net cost per cubic yard of wood prepared is divided as follows:

8½ pounds of sulphate of copper, @ 7½c.....	\$ .36
Labor, general expenses, and contractor's profit.....	2.36

Total cost of preparation.....	\$2.99
Cost of the wood.....	5.90

Net cost per cubic yard.....\$8.89

This sum is less than the expense occasioned at the same time by the Boucherie process. In the first place the cost of the wood designed for the injection in a close vessel, is less than that of the poles delivered at Lierre, because they do not require, as in the first case, that the trees be freshly cut. On the contrary, the drier the trees are the more readily do they absorb the solution.

Several foreign contractors have offered to the administration prepared poles at an advantageous price. A public auction occurred in 1866 of a lot of 3,400 spruce poles, injected with sulphate of copper, and with the bark taken off, delivered at the station of Mous. The dimensions of these poles differed from those of the poles furnished at Lierre. We give below an abstract, with the price of the different samples:

Number of the Poles.	Length in feet.	Circumference, 6 ft. from bottom.	Approximate size, Cubic ft.	Price.
2	20	18 inches	3.935	1.34
3	25	18 "	4.48	1.60
6	20	24 "	7.75	1.40
7	25	24 "	8.67	1.78
9	30	27 "	9.97	2.40

The medium cost per cubic yard of wood is \$9.78. These poles were of a very fine quality and perfectly injected.

M. J. Vincent demonstrated in 1863 and 1864 the economical results of the preparation of the poles by an examination in which he estimated the cost of the poles prepared and unprepared, together with the expense of renewal and of the interest on the whole outlay in each case, on the supposition that unprepared poles would last five years and those injected with sulphate of copper fifteen. The experience acquired since that date shows that the duration of fifteen years is far from an exaggerated estimate, in fact it is below the average. We will take the formulas which have served for these demonstrations and admit a duration of twenty years and substitute for them the values which we have cited to compare the results of 1865.

The cost of maintenance is given in the formula—

$$a = \frac{0.05 \cdot p}{(1.05)^n - 1},$$

in which  $p$  represents the cost of the poles and putting them up,  $n$  the number of years of their duration, 0.05 the interest of the capital employed.

The cost in round numbers per cubic yard is 44 francs for the wood, 18 francs for the cost of preparation, and 16 francs for the expense of transportation of the poles, putting them up and fastening the insulators to them. Thus  $p = 78$  and  $a = 2.35$  for the prepared wood, and  $p = 60$  and  $a = 10.93$  for the unprepared wood. In addition to these respective amounts the interest on the capital of 78 and of 60 francs, they find that the total expense per annum is 6.25 in the first case and of 13.93 in the second. The saving realized by the preparation is therefore 55 per cent.

The determination of the most economical and efficacious process for preserving wood continues to be the object of research in Holland, where the value of the Boucherie process is variously appreciated. According to the report upon the situation of the telegraphs made to the King in 1865, the chloride of zinc gave better results than the sulphate of copper in the Province of Gueldre. In the Province of Overijssel the poles injected by the Boucherie process and planted in 1860 were found to be in a perfect state of preservation in 1865.\*

\* See vol. 20 of the *Annales des Travaux publics de Belgique*, p. 37, and vol. 21, p. 211.

The variety of the results obtained are attributed in great part to the differences which exist in the mineralogical formation of the earth in which the poles are planted. It has been found that *calcareous matter causes the decomposition of the sulphate of copper injected in the poles, and that the ground, where very sandy, has the property of absorbing the sulphate of copper of the injected wood.*

When the preparation of the chloride of zinc was tried in Prussia, previous to 1854, it was apparently demonstrated that it could not be applied advantageously, *the chloride of zinc being washed out in time by rain water.*

According to M. L. F. W. Rother, the poles injected with chloride of zinc are very badly preserved in calcareous earth, and last on the contrary, a very long time in sandy or gravelly ground.

Of 2,000 poles prepared with chloride of zinc, planted in 1852, 210 only had rotted in 1862.

The cost of preparation with chloride of zinc in Prussia is \$1.78 per cubic yard of wood.

#### INSULATORS.

The insulators employed upon the Belgian lines are made of porcelain in the form of a bell, higher than broad, into which an iron hook is fastened with plaster. The bell is fastened to the pole at the center by a stirrup of galvanized iron. Figure 1 represents

Fig. 1.

Fig. 2.

the small insulator. Another form of insulator, Fig. 2, in use differs from the above in the shape of the stirrups, and by the existence of a double bell, the interior being composed of ebonite (bone rubber) surrounding the shank of the hook. A support of beech wood is pressed between the collar of the insulator and the pole.

The detailed cost of each model is as follows:

THE LARGE MODEL.		Cents.	Mills.
Porcelain bell.....	10	4	
Ebonite bell.....	6	0	
Galvanized iron hook.....	3	0	
" " stirrups.....	4	8	
Two strong screws, with square heads, of galvanized iron	4	0	
Beech wood supports.....	2	4	
Fastening with plaster.....			6
Total.....	31	2	
THE SMALL MODEL.		Cents.	Mills.
Porcelain bell.....	5	2	
Galvanized iron hook.....	1	4	
" " stirrups.....	2	6	
Two small screws with round heads.....	1	4	
Fastening with plaster.....			4
Total.....	11	0	

In attaching the small insulator to the pole it is necessary to compress the stirrup at the middle in order to firmly embrace the bell. In this manner they give the insulator sufficient stability without, however, preventing their being turned in order to facilitate the introduction in the hook of a very taught wire. When they use this model on curves of great radius, they nail against the post a small support of wood, upon which is supported the convex portion

of the bell. The plan of fastening the large model—the double bell—presents all the guaranties for stability desirable.

The proper penetration of the screws has the effect to compress the insulator and the beech wood support against the pole, and of determining in this a slight pressure of the two extremities of the stirrup, the result of which is that the insulator supports all preserve a proper elasticity, enabling them to sustain with ease the greatest effects of traction. This arrangement requires, therefore, to be adopted for large wire and on curves of small radius.

In the construction of the lines, or in the hanging of a supplementary wire, they first attach the insulators to the poles and afterwards introduce the wire in the hook.

In replacing an insulator upon a taught wire, they loosen the screws to enable them to turn the bell, and then introduce the wire into the hook; they then remand the bell to its normal position and tighten the screws again.

The insulator of the small pattern is employed:

- 1st. With the wire of No. 11 gauge;
- 2d. With the wire of No. 8 gauge on straight lines and in the curves of large radius.

The large pattern is employed to support the wire of No. 6 gauge, and the wire of No. 8 gauge in curves of small radius.

The advantages which these insulators present by their form are as follows:

- 1st. The bell of porcelain is perfectly symmetrical and turns readily upon its axis.

The thickness of the porcelain is about the same in all parts which facilitates the drying. These two properties joined to those which result from employing two materials, not cemented together, favors besides its durability by preventing the injurious effects of a change of temperature.

Ever since this pattern has been adopted the breaking of the insulators has been reduced to the cases of malevolence, collision or exceptional accidents.

- 2d. The wire being free in the hook and the stirrup having a certain elasticity, the porcelain has nothing to sustain but the weight of the wire. It is not subjected, as in the insulators which invariably hold the wire, to the sudden variations of traction, and which tends to injure their solidity.

The interior hook is not large enough to cause, by its expansion, an effect sufficient to break the bell, as is the case in certain models adopted in Prussia. It is well known that presence of cracks in the insulators injure their insulating properties. From the cause above mentioned, there are insulators which, when first put upon the lines, were superior to those employed by the Belgian service that after a very short time become very much inferior.

The iron stirrup does not injure the insulation as some have pretended. The escape of the current to the earth is produced almost exclusively from the surface of the insulator, when that is wet by the humidity of the air. The insulating property depends consequently only on the length of this surface, and can be augmented by the increase of the height of the bell, and also by the addition of a double or interior bell. The conditions which result from the employment of an iron stirrup are sensibly the same as if the wire reposed upon the top of the insulator, where that is supported by a bracket of iron fixed in the interior, according to the example of that which exists in the Prussian system.

- 3d. The hook being cemented in that part of the porcelain which is protected by the iron stirrup, it is

very difficult to absolutely break the insulator, as by this design when the inferior part of the bell is broken off, the hook continues to support the wire. In this case their insulating qualities are partially destroyed, but the wire is prevented from getting crossed with those under it, and is thus enabled to work. The interruptions which are necessarily produced under the same circumstances by the employment of other systems of insulation are consequently almost always completely avoided.

The bell insulators of cylindrical form, are preferable to those which are very wide at the lower end, because they offer a much greater resistance to the movement of the air under the bell, and they also diminish the accumulation of the moisture which is condensed upon their interior surface.

On the other hand this condensation is as much more abundant when the temperature of the insulator differs much from that of the circumambient air. We conceive, consequently, that the presence of an interior bell, perfectly sheltered against radiation, augments to the highest degree the insulating property of the supports.

The ebonite, being a highly insulating substance, very light and not hygrometrical, has been chosen by the Belgian administration to form the double interior bell. It remains to be seen if it is sufficiently durable. In the cases where experience has shown that this substance changes too rapidly for its advantageous employment, nothing prevents the substitution of porcelain, as in the case of certain German models.

- 4th. The cleaning of the bells is accomplished with facility. Their replacement is executed with rapidity, and, in case of the breaking of the porcelain, all the other parts can be used again. They are packed without difficulty, and the loss occasioned by transportation is relatively small.

The cementing of the hook in the insulator, is made by the means of a mastic formed of tempered plaster, reduced to a fine powder, moistened with water containing one-fifteenth of liquid glue. This cement, in consequence of its great hardness, permits of the fastening of the hook in the porcelain without the danger of producing a cavity from shrinkage. It does not offer, like the cement made of sulphur and iron filings, which were employed in the beginning, the inconvenience of causing the destruction of the porcelain from expansion. It is besides, more economical than the latter mastic.

In Belgium, as in many other countries, they give to the wires a proper versed sine which is effected by an apparatus placed every half mile upon the insulating supports.

Fig. 3.

The support of tension called the champion, Fig. 3, is in general use at the present time. It is traversed by a pin supported by two straps, which are attached to the pole by screws. It is, in consequence of the iron work, a little more expensive than the old pattern, but it has the advantage of being a better insulator and of possessing much greater stability.

Upon the cylindrical part of this champion insulator they adapt the hangers to the collar. This support serves, in addition, to hold the wires in a definite manner at their entrance into the offices and in tunnels as well as at their junction with subterranean or submarine lines. It also takes the place of the bell insulator upon very crooked lines, or at the summit of the most decided angles. These cases are only presented upon common travelled roads or ordinary routes. The wire is fastened to this insulator by a fine tie wire wound around the champion.

Iron work of special forms serve to support the champion insulator in the various circumstances which we have named above. Galvanized iron work called stays are cemented in stone, Fig. 4, and those of the same material of a triangular shape, Fig. 5, are used when the surface of support is wood.

Fig. 4.

Fig. 5.

a simple small board, sometimes it is even fastened to the moulding of the cornices.

Iron work in the form of a loop, Fig. 9, is used also with the interrupter when intended to be attached to cutstone.

Fig. 6.

An iron loop, with a shank of the same, Fig. 10, containing the interrupter permits of the interpolation of an office upon a line wire without the necessity of attaching this iron work against a building or upon

Fig. 7.

a pole: one of the ends of the line wire is attached to the hook, and the other end to the interrupter supported by the iron work.

This interrupter does not give perfect insulation, and should only be employed in places sheltered from the rain or upon the lines of small resistance.

Fig. 8.

The insulators called flats, Figs. 11-12, closed and open, which were employed to support the wires everywhere, where the placing of the bell insulators offered peculiar difficulties, are now prohibited. They were very convenient in use but their insulation was very poor in rainy weather.

Fig. 9.

Fig. 10.

Figs. 11-12.

They were especially used in supporting the wires on the buildings or in the interior of the viaducts, which traverse the tracks of the railroads. They have been replaced by the ordinary bell insulators, which are attached to poles, placed alongside of the buildings or placed upon the viaducts, upon small poles, obtained by cutting the ordinary pole at the middle, and attached by iron clamps to the masonry.

#### TENDEURS.

Double tendeurs, of the model adopted in France, and simple tendeurs, of the Belgian system, are generally employed at the present time.

The simple tendeur, Fig. 13, is composed of a drum

casting, in the axis of which is a ratchet wheel of iron and which is pierced in the middle. A cap formed of a strong plate of sheet iron, folded so as to admit of the passage of the wire at the extremities, sustains the drum, and also a catch which drops into the teeth of the ratchet wheel. In using the tendeur, they introduce the wire at the bottom of the groove, and turn the drum by means of a key, made of a simple bar of iron, which they attach to the axis of the drum.

This tendeur can therefore be placed in service without cutting the wire. It avoids, consequently, the expense of much labor in attaching the wires, and also the inconvenience which would result from cutting them. It is also recommended by the moderate price at which it is furnished. It presents, on the contrary, a defect which restrains its use, not being fixed to a support, it sustains with difficulty, by its unsteadiness, the tension of a No. 6 or 8 wire. The linemen can only taughten a wire of No. 8 gauge upon a length of about half a mile.

This circumstance does not permit of the employment of the simple tender in taughtening the No. 6 wire, which is, however, very rarely used.

Fig. 13.

The double tendeur, Fig. 14, is formed of two drums, each sustained by two iron plates; the two parts are reunited by a collar. The two extremities of the wire are placed in a hole pierced in each drum near the diameter. Upon the axis of the drums are attached the ratchet wheels.

The tendeur, which is most generally employed, is the collar tendeur, Figs. 15 and 16. The drum is supported by an iron plate which they have adapted by means of a key to a collar which is attached to the champion insulator.

Fig. 14.

Two tendeurs, of which the difference of form has no other aim than to place the two axis of the drums in the same horizontal plane, are attached to the right and left of the support. This tendeur permits of the operation with facility upon the tension of a No. 6 wire. It requires a little more time than with that of the double tendeur; but its insulating support presents more stability and a better insulation than the support of tension, so that it has been employed up to the present time. This tendeur is peculiarly desirable in curves, because it permits the exercise of a successful effort to overcome the resistance. It is also especially convenient for drawing up the wire at terminal stations.

All these tendeurs are made of galvanized iron.

It is indispensable to fasten the wires which are rolled upon the drums of the double tendeurs, and upon the collar tendeurs, by a junction wire soldered at their two extremities.

**PRINTING TELEGRAPH MACHINE.**—Charles T. Moore, White Sulphur Springs, West Va.—This invention consists of a set of sending apparatus, a set of receiving operating apparatus, and a set of apparatus for "calling" the office or station to which the message is to be sent, all conveniently arranged upon a stand, and adapted to work in conjunction with similar machines at all the stations, and capable of communicating with all the stations simultaneously, or with only one, as required.

#### The Decay of Telegraph Poles.

It is now some thirty years, since an Englishman named John Bethell solved one of the most important problems ever put to the mechanical and scientific world. In 1839 he introduced to the public, under the security of letters patent, his process for preserving wood from decay and the attacks of insects. For centuries European publicists had been noting the disappearance of forests, and predicting a wood famine throughout the whole extent of civilized Europe unless some method could be devised to bring production and consumption more nearly into equilibrium. As far back as the time of Louis XV., that eminent economist and statesman, Colbert, uttered a cry which found its echo in every quarter of the kingdom, "France will perish for want of wood." The famous edict of 1669 by Louis XIV was the beginning of a system of forest culture which was followed up by Mazarin and Colbert and has been continued by their successors in the Ministry to the present day, in France, with the greatest care. A report recently published in Paris by order of the Minister of Public Works (*"Mémoire sur la conservation des bois à la mer. Par A. Forestier, Ingenieur en Chef des Ponts et Chaussées, etc."*) shows by careful statistics the rapid destruction of French forests, and the absolute necessity for the discovery of some antiseptic agent, the several methods of impregnation of the wood by mineral salts under the systems of Kyan, Boucherie, Margary, Burnett and others, having failed to accomplish the purpose except very imperfectly and at unreasonable cost. An account in detail is also given of a series of costly experiments made by England, France, Belgium and Holland, through a space of more than twenty years, with every known process of any value, each with the assistance of the inventors or owners of the processes, and the conclusion arrived at by each government was that creosote oil, or the "dead oil" resulting from the distillation of coal-tar, was the only infallible preservative for wood known to modern science. It was found not only to preserve timber from dry-rot and wet-rot under any and all circumstances, but to protect it as well from the white ant (Termite) and the naval worm (Teredo Navalis), its most destructive enemies on land and in the sea. The space of the JOURNAL is too limited to quote even a few of the number of instances in which the above facts were verified, but it will suffice to say that railroad sleepers laid down in 1839 were found in 1867 to be as sound as when first hewn, and piles from the marine structures of English, French, Belgian and Dutch ports, exposed in some cases over twenty years to the naval worm, were found to be untouched, while several successive sets of untreated piles placed alongside them were literally devoured. At one time, in fact, the government of Holland was panic stricken at the threatened submergence of that country by the destruction of their system of dykes by the naval worm. Since 1840 the Bethell system has been adopted by Great Britain, France, Holland, Belgium, Germany, Spain, Portugal, and Italy; and in India, Cape Colony, Brazil and other tropical countries.

It is a curious fact, however, and illustrative of the pur-blindness which often characterizes European inventors, that while it was found next to impossible under Bethell's process to impregnate every portion alike with the preservative substance, neither Bethell himself nor any other inventive genius discovered how the creosote oil might be distributed throughout the woody structure, and the great discovery be thus perfected. Bethell's method was to subject seasoned wood to a bath of the oil in an air-tight cylinder, in which the pressure of 10 to 12 atmospheres was used to force the liquid into the pores. Of course, the press-

ure being equal at both ends of the wood, as the oil was driven in, the air in the pores was compressed more and more, until it finally acted as a spring and kept the oil from penetrating to the center; but it never occurred to Bethell that possibly some better plan might be devised to get the oil in than his first crude conception. It was reserved for Robbins, an eminent American inventor, to complete the Englishman's unfinished task. He rejected at once all of Bethell's costly engines, cylinders, compressors, guages and vats, and simply put the oil into the condition of a *vapor*, leaving it to penetrate the inmost cells of the wood by its own wonderful expansive power, its particles being 1100 times as sublimated as those of the crude oil. The apparatus resorted to to effect this result was a simple iron box or cylinder having connection with a still in which the oil was subjected to distillation by heat. Robbins found that he could take green wood direct from the forest and in a few hours not only thoroughly impregnate it with carbolic-acid, naphtha and the other products of coal tar, but season it as thoroughly as if it had lain in a drying-yard for two or three years. The inventor has not only realized (in the three years that have elapsed since his discovery was made known) a large fortune himself, but companies have been organized in various States and in Europe, and our government is making a special investigation of it with a view to its adoption.

Among the scientific journals which have discussed the various methods for preserving wood, and given preference to the application of coal tar by the Robbins Process is the *American Artizan*, which in a recent number gives the following comparative cost of the different substances commonly used as wood preservers:

Article.	Price.	Article.	Price.
Chloride of Zinc, per lb. \$1 50		Asphaltum, per lb. . .	18
Corrosive Sublimate, " 1 10		Resin, " . . .	01½
Sulphate of Copper, " 12½		Wood Tar, " . . .	01½
Carbonate of Soda, " 10		Coal Tar, " . . .	01

Thus it would seem that Providence, in furnishing when most needed a remedy for a great public want, has in this case, as in almost every other one, given it in a form most simple, cheap and easily applied. Just when the whale was beginning to disappear and there was universal inquiry for some substitute for its oil, petroleum was discovered, when wood was becoming scarce along our sea-board anthracite coal was utilized, and now that the rapid disappearance of American forests is alarming the foremost thinkers who have looked into the subject, this preservative method is discovered or rather, perhaps, it should be said re-discovered, for there is little doubt but that, in a somewhat different form, it was known and used by the ancient Egyptians.

To apply practically the information contained in the above lines to the interest which this journal represents, it is well to calculate what could be saved to the telegraph companies of the world by some method that would effectually preserve their poles and other exposed wooden structures from decay and the attacks of insects.

It appears from the last report of President Orton to the Stockholders of the Western Union Telegraph Company, that there are of line in:

Country.	Miles.
United States and British Provinces . . . . .	73,036
Austria . . . . .	24,618
Belgium . . . . .	2,187
Bavaria . . . . .	2,115
Denmark, (about) . . . . .	1,250
France . . . . .	20,628
Great Britain and Ireland . . . . .	16,568
Italy . . . . .	8,200
Prussia . . . . .	18,886
Russia . . . . .	12,013
Switzerland . . . . .	1,868
Spain . . . . .	8,871

Here, then, is a stretch of 189,750 miles of telegraph requiring, at our average of 38 poles to the mile, 7,210,500 poles. The average cost of poles in this country is about \$3.50, and the average life of a pole from 8 to 9 years. Thus if we apply American prices and American averages of durability to the above statistics it appears that it costs the telegraph companies of Europe and North America \$2,804,083.33 every year to replace the poles which are so badly decayed that they have to be taken down. The Western Union Company's system alone comprises 66,368 miles of poles which at the above average and price involve an annual expenditure of \$979,219 to replace 279,777 poles; and this is the measure of the company's interest in the application of a process that would effectually preserve wood from decay and the ravages of insects.

The treatment of poles with hot vapors under Robbins' process would necessitate, of course, the placing of the pole in the tanks, and this would be of no service in the case of standing poles, that is to say, the standing poles would have to be taken down, carried to the works, treated, and reset, which would be almost impracticable, and somewhat costly. To obviate this difficulty Mr. Robbins has, at the suggestion of some prominent telegraph men, recently devised and patented a plan for applying the creosote oil to the standing pole, which was the subject of brief notice in a recent number of this paper.

#### New Uses of the Telegraph.

The telegraph will undoubtedly gradually take the place of postal communication, so far as a large proportion of correspondence is concerned, although the mere labor of rewriting or operating through the wires will always make the carriage of letters an important business.

In financial affairs the telegraph will do away with the necessity of a considerable proportion of the currency. Upon a system similar to that of the New York clearing house, large operations can be made through the telegraph without the medium of money, by depositing balances at commercial centers. Through the instantaneous action of the telegraph these balances can, for all practical purposes, be used as readily as if they were in the hands of their owners.

The bank of England has already proposed to pay the dividends on British consols, through the use of the telegraph, thus obviating the old, clumsy and troublesome system of requiring the personal presence of the bondholders or their attorneys at the place where the payments are made.

Another suggestion has been made, carrying out the principles of the insular establishments of England to the affairs of the whole world. It is nothing less than to extend the use of the telegraph so far in the interests of commerce as to keep the shipping agents and masters, in all the ports of the world, advised of the rise and course of storms, and the electrical and atmospheric condition of different parts of the globe. There is no knowing how far science, already able to foretell with so much precision the movements of the celestial bodies, may thus be enabled to reduce to system the phenomena of the weather, and, from a philosophical basis, foresee whence the wind comes, and whether it goeth. The mere knowledge of the distant or approaching storms and winds would produce a great saving of life and wealth, as well as of time, in voyages.—*Buffalo Com.*

THE Supreme Court of Nevada has decided that the telegraph is a branch of commerce, and, as such, is under the control of Congress.

#### New Patents.

Protection granted in England to George Little, of Rathferford Park, N. Jersey, for improvements in apparatus for composing, transmitting, and receiving telegraphic communication. Dated, Sept. 7, 1869.

"MANAGER," Painesville, O., asks questions respecting the propriety of certain allowances to offices which we are unable to answer.

#### A Beautiful Idea.

Away among the Alleghanies, there is a spring so small that a single ox, on a summer's day could drain it dry. It steals its unobtrusive way among the hills till it spreads out in the beautiful Ohio. Thence it strides away a thousand miles, leaving on its banks more than a hundred villages and cities, and many a cultivated farm, and bearing on its bosom more than half a thousand steamboats. Then joining the Mississippi, it stretches away and away some twelve hundred miles more, till it falls into the great emblem of eternity. It is one of the great tributaries of the ocean, which obedient only to God, shall roll and roar till the angel, with one foot on the sea and the other on the land, shall lift up his hand to Heaven and swear that time shall be no longer. So with moral influence. It is a rill, a rivulet, a river—an ocean, boundless and fathomless as eternity.

#### Married.

MONTGOMERY—EARNHEART.—On Tuesday evening, October 5th, at the residence of G. L. Herndon, by Rev. T. B. Lawson, Charles W. Montgomery, Manager Western Union Telegraph office, Trenton, La., to Miss Mary Frances Earnheart, of Monroe, La.

CATLIN—BEERS.—At the residence of the bride's mother, No. 4 West Twenty-eighth street, New York, on the 6th instant, by the Rev. Dr. Geer, Fred. Catlin, of the Western Union Telegraph office, and Miss M. Carrie Beers.

We congratulate our friend Catlin on his changed circumstances, and trust that he and his charming bride, may find ever increasing happiness in their wedded life. We designed a similar word of congratulation to his office companion, H. Frank Thurber, at the time he ended his single blessedness, which we take this occasion to record. Married men make good citizens, and happy marriages enhance the value of good men. We kiss our hand to both of you, and wish you and yours all the bliss you can bear. Live a thousand years if you can, and be much multiplied.

The following facetious missive was sent to Mr. Catlin on his arrival at Philadelphia by his New York chums.

To Fred Catlin:

We congratulate you. May the Beers you took last night carry you safely through life and guard you from its *Atings*. May your future be free from *Bitterness* and well stocked with happiness. We trust you have commenced wedded life with a *stout* heart and plenty of *XX* in your pocket. We also congratulate the bride, and though she is no longer "*Beers*," we hope she will find you not only to be *hers* but always *de-side-her*.

And here is another congratulation to two happy birds recently mated and wed.

Friend Dimmick and Miss Young are married;

And have formed a corporation  
Since long single enough they've tarried,  
For—lets say, "Mutual Admiration,"

May merry bells for them be rung,  
And their happiness have no limit,  
While to the firm of Dimmick and Young,

May there be added soon Young Dimmick,  
But Brother D. if happy made,  
By such a gift from the great Creator,  
Don't forget the good old trade,  
But make him an A. 1. operator.

PORTLAND, Me., October 21, 1869.

E. O. O.

Who comes next?

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1867. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS :

ONE DOLLAR PER ANNUM IN ADVANCE.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, NOVEMBER 1, 1869.

### Mock Auctions and Swindling Telegraph Schemes.

For many years past the press has waged an uncompromising war upon the hosts of villains who have sought to obtain a dishonest livelihood by preying upon the ignorant and credulous portion of the community through the various fraudulent but seductive schemes of gift enterprises, mock auctions, bogus lotteries, and numerous others spurious swindling and bastard contrivances by which the simple and unwary could be fleeced of their hard earned money. Not only have the public journals endeavored to put a stop to these nefarious practices by exposing their fraudulent character, but municipal authorities and magistrates have sought by the exercise of their official authority to effect the same result. Notwithstanding all these efforts, however, the gift enterprise dealers, mock auctioneers, ticket swindlers, pocket book stuffers, &c., still flourish, and their victims can be reckoned by thousands.

But while the press and magistrates are doing good service in their efforts to stop these particular swindles, others of a more serious character are constantly perpetrated for which there seems to be neither remedy nor an attempt at one on the part either of the newspapers or the authorities. We refer in this connection to the originators and promoters of the numerous swindling stock companies which have been for many years and are still employed as a means of robbing the simple and unsuspecting in every section of the country.

A few years ago the efforts of these *Chevaliers d'Industrie* were devoted to the getting up of bogus gold, silver and copper mining companies by means of which thousands of people have been ruined. After these various schemes, based upon these imaginary mines, had been worked out and no more victims could readily be found to invest in them, the swindling gentry struck a new lead in the oil regions. The discovery of petroleum, which occurred at about this time, gave them an opportunity to gather a greater harvest from the fruits of chicanery than any they had yet obtained. Companies were gotten up by hundreds, and there is scarcely a town of any size which does not contain its victims. It made no difference in the success of these schemes whether the getters up of the companies owned any land in the oil producing regions or not, neither did any one

stop to inquire into the character of the manipulators of the companies; there was magic in the mere name of petroleum, and the stock was always gobbled up with the greatest alacrity. No sooner, however, did the oil fever consume itself, and before the victims were decently interred, than the sharpers turned their attention to the creation of bogus telegraph schemes. Taking advantage of the consolidation of the United States and American Telegraph Companies with the Western Union—a consolidation not made in the interest of speculation but to improve the service—they issued circulars and prospectuses containing the basest falsehoods in regard to the profits to be obtained in establishing rival telegraph lines, and by employing tricks similar to those used by the lottery swindlers and mock auctioneers, they have succeeded in fleecing a number of victims who had escaped the bogus mining and oil frauds. It is curious to note, in this connection, the remarkable resemblance between the operations of these fraudulent telegraph schemers and those of the gift enterprises and mock auctioneers. In each case the bottom ring is composed of a few sharpers; each have their stool pigeons and Peter Funks, whose duty it is to represent the disinterested confidence which they have in the swindlers who are actively conducting the operations. These "honest gentlemen" are supposed to invest their money in the schemes and to be perfectly satisfied with the result. The bogus telegraph companies have their stool pigeons in the form of directors—sometimes men of reputed good character and position—who either divide the ill gotten gains with their associates who get up the companies, or else are cheaply bought with shares of the worthless stock.

It would perhaps be too much to expect that this nefarious traffic will ever cease. As long as there are knaves to get up companies and fools to invest in them the work will go on, and probably this will continue until the victims of swindling telegraph builders shall be as numerous as those of their prototypes who patronize the gift enterprises or are "sold" by the mock auctioneers. We would offer this bit of advice, however, to those who have yet any money to lose. Beware of any man who proposes to give you two dollars for one, no matter what the scheme may be. If you have more money than you know what to do with, bestow it upon worthy objects of charity, or employ it in the liquidation of the national debt, and thereby secure to yourselves the satisfaction of having done some good with it rather than invest it in speculative telegraph schemes for the benefit of a class of rogues who will not only do no good with it, but will laugh at your credulity. To those who have subscribed for this worthless stock, we advise the absolute refusal to pay any farther assessments. In some sections of the country this course has been pursued, and the promoters of the schemes, after trying to frighten the subscribers into the payment of their subscriptions and which have been resisted on the ground of fraud, have relinquished all suits which were begun for this purpose, thus acknowledging the truth of the charge. P.

### Preservation of Telegraph Poles.

A special interest attaches to the present number of the JOURNAL from the fact that the subject of the treatment of telegraph poles to prevent their decay, is exhaustively and ably presented in it. The valuable translation by Mr. Prescott, of the official report from the *Annales* of the French Bureau of Civil Engineering, shows the results attained in Europe, while an original historical sketch prepared for this paper, makes us acquainted with the improvements that have been made in this country. The matter is one of vital importance, and merits, as it cannot fail to receive, the most careful attention. It would seem that the extreme high price of the various metallic salts used in the Kyan, Boucherie and other foreign processes, their known destructive action on vegetable fibre, when present in excess, and their liability to be leached out by the nature of the soil or by the surrounding moisture, prevent their being accepted as equal to creosote oil for preservative purposes, while the expense of the Bethell process, and the filthy condition in which it leaves the wood, make it open to the objections urged in the French report for the purpose in view. The translation, though long, will be found interesting and instructive.

THERE seems to be an apprehension that the tariff which went into operation October 1, will prove so radical as to seriously affect the income. We may venture to quiet this apprehension by expressing our conviction that it will have the effect of releasing much business which, by reason of charging by routes necessarily circuitous, had remained undeveloped. The tariff between large cities, which are almost all connected by air line wires, had already been reduced to minimum limits and is not affected by the October arrangement.

THE operators of the Franklin Telegraph Company, on October 25, struck for an increase on low and irregularly paid wages. They demanded 25 per cent. increase on all salaries. They were offered 15 but refused. The salaries for first-class operators under their employ have averaged \$1,000 per annum, being much less than corresponding services are paid by the Western Union Telegraph Company, and the result, confessedly, of straightened finances. This strike has embarrassed the company, which, as we write, have been compelled to work with greatly reduced force. This is one of the results of speculative opposition lines. To live, some one must be preyed on. The laborer becomes the first sufferer, and those who cheered its building to break down monopoly, have, in turn, to become monopolies by combination to live. Strikes may be sometimes effective and just, but their influence is generally pernicious. It separates interests which should be one, and stimulates invention to make labor unnecessary, or revenge for interference.

Just as we close the paper for the press the Franklin Company have agreed to advance the salaries of first-class operators from \$83.33 to \$100 per month, and minor salaries 15 per cent. The acceptance of these terms by the operators evinces the moderation of their demand, which only asked to be placed on a footing with their fellow laborers elsewhere. The whole matter has been managed with marked firmness and moderation, yet we trust that no such resort may again be necessary. The peril to public business by strikes would compel the assumption of the telegraph by Government, and the enslavement of the craft would be complete. Resistance would be crime.

## OFFICIAL STATEMENT.

## Western Union Telegraph Company.

	Sept. 1869.	Sept. 1868.
Total Receipts.....	\$669,706 79	\$630,665 36
Total Expenses.....	419,729 29	372,197 50
Net Profits.....	\$249,977 50	\$258,467 86

## Cooper Institute.

## FEMALE SCHOOL OF TELEGRAPHY.

LYDIA H. SNOW, DIRECTRESS.

## DIPLOMAS.

To Isabella Sellev, Elizabeth O. Blanchard, Florence Colyer,  
Armenia Frazer, Fanny Oliver.

## From the Annual Report.

Among the avenues for female labor, telegraphy has long appeared to the trustees to offer the most attractive opening. The nature of the occupation seemed to be peculiarly adapted to the habits and constitution of women, and their fidelity in the discharge of duty seemed to render them peculiarly valuable for the delicate duties with which the telegraphic operator is charged. In fact the experience of the telegraphic companies had gradually but surely convinced the managers that their interests would be greatly promoted by the substitution of women for men in the greater number of the offices. But it is always a difficult task to open a new department of instruction, and it would have been impossible, indeed, for the Trustees to have made the attempt even to establish a female school of telegraphy, if the enlightened managers of the Western Union Telegraph had not responded in the most prompt and liberal manner to the overtures of the Trustees, by furnishing not only the instruments, but, what was far more important, a competent instructor in Miss L. H. SNOW, who had risen by steady steps to the very front rank of American telegraphers. Three months ago the school was opened by the admission of sixteen pupils. Of these two resigned, and four were found incompetent. Of the remainder five have already been qualified to take regular situations, and three of these are already provided with places. A very short time will serve to qualify the remainder for regular work, and it is apparent to all that the school is an unqualified success. The demand for these operators exceeds the supply, and the remuneration is such that any young woman can support herself in comfort, and, if she is very diligent and expert, could readily accumulate a provision for that period when telegraphy will cease to be her occupation. The school, as now organized, will probably supply twenty operators annually. It is not yet clear whether it will be expedient to enlarge its capacity.

This proves that practical telegraphy can be taught in a properly conducted school.

We made an error in sketching the key of Mr. W. C. Havens, illustrated in our last, and now correct it. It will be seen that the action of the key lever is merely to separate the spring behind it from its connection when open, and release it when closed. There is, there-

fore, no mashing of the platinum, or uncertainty where the points will meet. It is easy, also, and is so designed, to arrange so that the platinum points will meet before contact at the ordinary anvil as well as to remain longer closed. This secures firmness and certainty of contact.

## Executive Order No. 83.

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
OCTOBER 26, 1869.

Please note the following modifications in rules for counting Atlantic cable business to take effect at once: Figures following each other consecutively are counted at the rate of five (5) to a word—any fractional remainder counting as a word.

Decimal points, commas, bars of division, &c., used in conjunction with figures, are counted each as a figure. When figures are separated by words, each group is counted at the rate of five (5) figures to a word, plus one (1) for any fractional excess. For example:

"Gold 135½-135½ Exchange 108½ Cotton 34 Petroleum 32½," is counted as follows:

Four ordinary words equal to . . . 4 words.  
135½-135½ equal to 13 figures or . . . 3 words.  
108½ equal to 6 figures or . . . 2 words.  
34 equal to 2 figures or . . . 1 word.  
32½ equal to 5 figures or . . . 1 word.

Total number of chargeable words eleven.

The above mode of counting is applicable also to letters which have not a secret signification.

Letters added to figures to form ordinal numbers are counted each as a figure. Thus, 137th is counted as five figures or one word. When figures are expressed in words by the sender, count each word as heretofore.

The "date" and "place from," if inserted by the sender, will be forwarded as a part of the message WITHOUT CHARGE, and must not be included in the count. If not inserted by the sender, the name of "place from" must be added to the check.

Rule 7 is modified as follows: Cypher messages, by which are meant messages consisting of letters, grouped or otherwise, not forming any known or dictionary words, or of numerals, are counted thus: Add together all the characters, figures, letters and signs employed in the cypher text; divide the total by five and charge each five and fractional remainder as a word. To the number of words thus obtained, add the address, signature and any ordinary words contained in the message. CHARGE DOUBLE the ordinary rates for these messages.

WM. ORTON, President.

## Correcting Checks.

In last number we gave an amusing illustration of a manager intensely disgusted over a check report, who proposed a summary and selfish mode of correcting it. He had no idea of course that it would fall into our hands. These check sheets are, no doubt, troublesome, and, to a careless manager, offensive. But nothing is more imperative than their employment. If that article left the impression on any mind that the correction of checks could be waived on even such a plea as "awful whiskey" we regret it. The integrity of the Company depends on the vigor of its check department, and, as it is designed to secure universal fidelity and justice, demands careful and prompt obedience to its rules, both for the company's sake and those who perform its duties.

## Annual Meeting.

The annual meeting of the Telegraphers Mutual Insurance Association will be held in the room of the check department of the Western Union Telegraph Company, 145 Broadway, New York, on Friday, November 5th., at 5½ P. M. Proceedings will be commenced promptly at that hour.

## TARIFF BUREAU.

## Semi-Monthly Circular.

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
NOVEMBER 1, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since October 15, the date of the last tariff order. Please note them in your tariff book;

## NEW OFFICES.

To be entered in Part I of tariff book.

* Alaska Switch, Pa.	399 Lebanon, Laclade Co., Mo.
73 Alexandria Bay, N.Y., previously given as square 82.	392 Lone Oak, Ark.
* Big Run Branch, Pa.	330 Milan, Tenn., reopened.
159 Crawford's, Pa.	83 Mattituck, L.I., N.Y., "
399 Crocker, Mo.	296 Monteno, Ill.
409 Centretown, Mo.	* Pond Eddy, Pa.
60 Delmar, Del.	447 Paola, Ka.
399 Dixon, Mo.	447 Pleasanton, Linn Co., Ka.
13 Dexter, Me.	54 Princess Anne, Md.
End of track Kansas Pacific Railway, 160 more than Lawrence, Ka.	Rock Springs, Ka., 100 more than Lawrence, Ka.
381 Forest City, Ark.	73 Redwood, N. Y.
189 Forestville, Mich.	* Royers Ford, Pa.
455 Glenwood, Iowa.	189 Sand Beach, Mich.
Irving, Ka., 80 more than Lawrence, Ka.	* Summit, Schuylkill Co., Pa.
	379 Sullivan, Mo.
	59 Topton, Pa. (check all business to Lyons, Pa.)
	73 Theresa, N. Y.
	271 Xenia, Ind., reopened.

## NEW OFFICES ON OTHER LINES.

To be entered in Part II of tariff book:

Tariff for other lines.	Leaves this line.
Alaska Switch, Pa. .... 35 3	Philadelphia or Harrisburg, Pa.
Big Run Branch, Pa. .... 35 3	" " "
Boyers Ford, Pa. .... 35 3	" " "
Summit, Schuylkill Co., Pa. 45 4	Rupert, Pa.
Pond Eddy, Pa. .... same as Port Jervis, N. Y.	

When, as above, more than one name is given, in the column headed "Leaves this line," offices will enter into their books the name of and the rate from that office via which the rate is the lowest.

## OFFICES CLOSED.

Elk Ridge Landing, Md., Aramingo, Pa., McEwensville, Pa.

## GENERAL INFORMATION.

The following changes in tariff and checking point on business for other lines have been made:

Tariff for Other Lines.	Leaves this Line.
Ottawissa, Pa. .... 35 3	Rupert, Pa.
McAuley's, Pa. .... 45 4	" " "
Ringtown, Pa. .... 45 4	" " "

The following changes are for Districts B, C, D (except offices in N. Y. State in District D), E, F and I.

Carbondale, Pa. .... 60 5	New York.
Hawley, Pa. .... 60 5	"
Lackawaxen, Pa. .... 40 3	"
White Mills, Pa. .... 60 5	"

For District A the rates will be 40-3 where the rate is 60-5, and 30-2 where it is 40 to points just named.

Offices in Districts L, M, O and Pacific Division will make their rate to squares 101, 110 and 129 equal to their rate to square 120 if they are at present less than to that square.

The new name for Smeedsville, Tenn., office is Dickson, Tenn.

The square of Homer, Ill., is incorrectly given in the tariff book. Please enter as follows: 308 Homer, Champaign Co., Ill.

Charlottetown and Summerside, P. E. I., have an incorrect rate for Other Lines in some of the books. The correct rate for all Districts (except "A" and Pacific Division, which have correct rate), is 170 and 11. Correct your book accordingly.

Olathe, Mo., in JOURNAL of October 1st, should read Olathe, Ka., not Neb., as in JOURNAL of October 15th.

All offices which do not check Binghamton, N. Y., direct, will compute tariff to points on Albany and Susquehanna R. R. named in last JOURNAL, via Albany, N. Y.

## TO OFFICES "HAVING SPECIAL SECRET A."

Tariff to Eaton, O., will hereafter be same as special rate to Dayton, O.

WILLIAM ORTON, President.

## Journal of the Telegraph.

## Telegraphers' Mutual Life Insurance Association.

J. Fuller,  
P. H. Cooke,  
A. Beamer.

## Worse and Worse.

The large and influential commercial convention recently held in Louisville, Ky., had, of course, a visit from Monsieur Tonson with his little Postal Telegraph Bill. That gentleman was, with great politeness, referred to the Committee on Miscellaneous Business, at which he much wondered, his business being profoundly special and personally great. He was still more astounded when that committee *unanimously instructed their chairman to report against the scheme, and against all propositions of a like character recommending the governmental interference operation of telegraph lines.* That sounds healthy. It is good Saxon sense. It is easily understood. Monsieur Tonson is disgusted.

## The American Institute.

As we said in our last the telegraphic articles on exhibition are few. What they lack in number, however, they make up in excellence.

CHARLES WILLIAMS, JR.,

of Boston, exhibits two relays, two sounders, a register and keys of various patterns of very perfect workmanship and finish, such as we believe to be characteristic of his general work. The designs are elegant and attractive, and compare favorably with any we have seen here or elsewhere.

MR. WILLIAM E. DAVIS,

of 319 Newark avenue, Jersey City, exhibits a very neat self-closing key of considerable ingenuity, and specimens of small and handsomely arranged relays as well as sounders, which, by a peculiar mode of winding the helices, he claims to be relatively stronger than where much more wire is employed. This mode Mr. Davis explained to us to be the complete wrapping of a single helix around the double core before commencing the second. Greater sensitiveness is thus said to be secured. The relay armatures are suspended and close their circuits by compressing two springs by which interference between the circuits is prevented, contact improved and general ease of action secured.

THE AMERICAN COMPOUND WIRE COMPANY.

exhibit specimens of their manufacture of the value of which we have already spoken. To secure increased conductivity and strength with diminished weight is a result so desirable as to be folly to ignore. Time will, we trust, prove its value. As all know it is a steel core wrapped spirally with a band of pure copper, thus securing a relative conductivity three fold greater than galvanized wire. The same company exhibit a cable without armor, whose strength is wholly in the core, costing half and weighing half ordinary cables.

The only remaining telegraphic articles on exhibition are the machinery of the Western Union office in the central aisle of the building, and the comely face of the good lady in charge thereof, Miss Frank S. Turner. She is never without an interested audience, whom she entertains with wondrous patience and amiability.

OFFICE WESTERN UNION TELEGRAPH CO., }  
21 Wall street.

EDITOR JOURNAL OF THE TELEGRAPH:

Permit me to make a correction. On September 24, the day of the gold panic, there were sent and received at:

Gold Room office, . . . . .	354 messages
21 Wall street office, . . . . .	1,400 "
Total, . . . . .	1,754

Yours truly,

WATSON D. SCHRAM, Manager.

## Tariff Enquiries.

WINDSOR, Vt., October 21, 1899.

EDITOR JOURNAL OF THE TELEGRAPH:

I would like to ask you in regard to local rates, adjusted with reference to distance, whether they are reckoned by the square or by the actual length of the wire itself? For instance, we are charging thirty and two for messages to a certain town not quite fifty miles distant in an air line, which if measured by the line of the wire, would be nearly double that figure. Are we correct? Please inform us and oblige

MORSE.

ANSWER.—Charge by air line distance in all cases.

Mr. Harry Wagoner has been appointed manager of North East, Pa., office, in place of C. A. Clute, who accepts the railroad agency at that place.

## Electric Clock.

L. Bradley, Jersey City, N. J., Sept. 28.—This invention has for its object the establishing and maintaining of an isochronous working of any number of clocks, at greater or less distances apart from a governing clock, operated by a spring or weight, through the agency of electro-magnets between which and the governing clock the circuit is broken and established at regular intervals by the action of the pendulum of the latter clock as a controlling power or device. In thus working a series of clocks, great irregularity and uncertainty have heretofore prevailed, owing to certain imperfections which have existed in closing the circuit by the action of the pendulum of the governing clock towards or at the close of each of its vibrations, when the momentum of the pendulum hung to vibrate in a vertical plane is checked or retarded, as it were, which occurring at the very period its power is required to close the circuit, coupled with a certain irregular or tremulous action of the circuit closing device or devices, as superinduced by the electric current, causes a feebleness or want of uniformity that fails to produce a regular isochronous action. This difficulty is obviated in this invention by the combination with a rotating circuit closer, operated by the governing clock, of a conical pendulum which, having a revolving as contradistinguished from a vibratory action, retains its power or momentum to close the circuit, and, operating in connection with the rotating circuit closer, feels or communicates no shock or check, but effects the closing of the circuit in a firm and positive manner, free from any interruption by tremulous action. The invention also consists in a certain combination of parts for insuring regularity in the movement of the secondary clock or clocks, and to prevent any overleaping as well as back action of the driving wheel or wheels, worked by the swinging armature or armatures of said clock or clocks, and thereby further contributing to establish a perfect isochronous action.

AN EXCELLENT APPOINTMENT.—The R. R. I. & St. L. railroad company will commence before the first of next month, putting a telegraph line along their road from Sterling to Burlington, passing through this city. The line will of course extend to St. Louis, but it will be completed to Burlington this fall. The company has wisely selected Mr. John Fleming to superintend the construction of the line, and also to manage it when completed. Mr. Fleming has been located at Rock Island for many years, having in charge the office of the Western Union Company. He is an operator of no ordinary ability, and fully understands the telegraphic business. As the manager of a line, we predict that he will prove a success, and think the Rockford company could not have chosen a better man for the position. He has our best wishes in his proposed new capacity.—Rhode Island Gazette.

**"Paddle Your Own Canoe."**

Up in this world, and down in this world,  
And over this world and through,  
Though drifted about,  
And tossed without,  
Why "paddle your own canoe."

What though the sky is heavy with clouds,  
Or shining a field of blue;  
If the bleak wind blows,  
Or the sunshine glows,  
Still "paddle your own canoe."

What if the breakers rise up ahead,  
With dark wave rushing through,  
More steadily try,  
With steadfast eye,  
To "paddle your own canoe."

If a hurricane rise in the midnight sky,  
And the stars are lost to view,  
Glide safely along,  
With smile and song,  
And "paddle your own canoe."

Up in this world, and down in this world,  
Over this world and through,  
Though weary and worn,  
Bereft, forlorn,  
Still "paddle your own canoe."

Never give up when trials come—  
Never grow sad and blue;  
Never sit down  
With a tear or frown,  
But "paddle your own canoe."

**The Sun a Flaming Fire.**

The curious insight we are beginning to glean of the highly susceptible and sensitive constitution of the sun, strikes our imagination more and more as new discoveries are made. That a mass but little denser even as a whole than water, nearly four times as light, bulk for bulk, as that of our own earth, and surrounded by an envelope of burning gas, which is by comparison with the intense heat and light of the proper surface of the sun itself mere cold and darkness—that a mere wandering flame of this kind, shooting rapidly through space, an iron smelting furnace throwing out tongues of fire on all sides, and so highly susceptible to external influence that certain combinations of planets which, when all thrown into the same scale, would make up only an infinitesimal portion of the sun's mass, cause the most marvelous disturbances in his physical constitution, and lead to magnetic storms on his surface—that such a body as this, we say, should yet for thousands of years exercise so orderly, continuous, and consistent an influence over the development of our terrestrial world and our human affairs, does seem truly marvelous. Can any thing be conceived less apparently likely to lead to fixity of tenure in our universe than a center for it such as this—a great boiling furnace of forces enveloped in an atmosphere of flaming gas, and subject to the most violent superficial excitements under the most apparently insignificant external influences? The old Hebrew conception of an earth "founded on the seas and established on the floods," which had been made so fast that it "could not be moved," was a conception of perfect solidity compared to that heliocentric basis of our universe—a hurricane of flame the disturbances of which might perhaps be best represented to our imaginations by the occasional explosion of a planet or two of nitro-glycerine, which we are compelled to substitute. Yet hence proceed attractions of gravitation which have not sensibly altered during the life of man upon the earth—waves of light indicating by their spectra the burning of the very same substances in the sun as were being consumed in all probability when the words "let light be" were first registered—and, as we now appear likely to learn, periodic magnetic impulses, recurring with the punctuality of seasons

and eclipses, certain to be full of import for us, and yet not improbably of the same nature as those greater hurricanes by which others suns have perished. Is it possible to conceive a more apparently unstable center and fountain of a universe of law and order? Is it possible to conceive a more impressive lesson on the words, "He maketh his ministers a flaming fire?"—*Harpers' Weekly.*

**Is this a Material Age?**

Charles Dickens, in his recent inaugural address, utters a sensible word respecting the "materialism of the age," a term so common in the lips of so many wise men who are ever taking the gauge of society around them:

"I confess that I do not understand the much-used and much-abused phrase—the 'material age.' I cannot comprehend—if any one can, I very much doubt—its logical signification. For instance, has electricity become the more material in the mind of any sane or moderately insane man, woman or child, because of the discovery that in the good providence of God it could be made available for the service and use of man to an immeasurably greater extent than for his destruction? Do I make a more material journey to the bedside of my dying parent or my dying child when I travel thither at the rate of sixty miles an hour than when I travel thither at the rate of six? Rather, in the swiftest case, does not my agonized heart become over-fraught with gratitude to that Supreme Beneficence from whom alone could have proceeded the wonderful means of shortening my suspense? What is the materiality of the cable or the wire compared with the materiality of the spark? What is the materiality of certain chemical substances that we can weigh or measure, imprison or release, compared with the unmateriality of their appointed affinities and repulsions presented to them from the instant of their creation to the day of judgment?"

"When did this so-called material age begin? With the use of clothing? With the discovery of the compass? With the invention of the art of printing? Surely it has been a long time about; and which is the more material object, the farthing tallow candle that will not give me light, or that flame of gas that will? No, ladies and gentlemen, do not let us be discouraged or deceived by any fine, rapid, empty words. The true material age is the stupid Chinese age, in which no new or grand revelation of nature is granted, because they are ignorantly and insolently repelled, instead of being diligently and humbly sought.

THE *Noctiluca*, the most beautiful of the marine infusoria, emits a brilliant electric light, which makes the sea shine like streams of silver in the wake of a ship, of a warm summer evening, when they come to the surface in countless multitudes. It is a globular animal, like a minute soap bubble, and, being about the thirtieth of an inch in diameter, is a giant among the infusoria. Its electric light, supposed to be emitted by a direct exertion of the nerve-power, appears constant to the naked eye, but really consists of momentary scintillations, that increase in rapidity and intensity by the dash of an oar or the motion of the waves.—*Somerville.*

CHICAGO is to have an astronomical clock, with dials all over the city, the hands of which will be moved simultaneously by a galvanic battery, and the bell in the court house is to be struck by the same means. It is to be copied from the London arrangement, and will be a capital thing. The Chicagoans will then be able to be regular and on time in their drinks and devotions.

FRANK L. POPE,  
TELEGRAPHIC AND ELECTRICAL ENGINEER,  
Nos. 78 and 80 Broadway, Room 48,  
NEW YORK.

**AMERICAN FIRE ALARM**

AND  
POLICE TELEGRAPH.

GAMEWELL & CO., PROPRIETORS.

NO. 104 CENTRE STREET, NEW YORK.

This system of Fire Alarm Telegraph, with a central office, or upon the

**AUTOMATIC PLAN,**

is now in operation in the following cities, to which reference is made for evidence of its great SUPERIORITY AND VALUE, and UNIFORM reliability:

BOSTON,	PORTLAND,
CHICAGO,	ST. JOHN, N. B.,
PHILADELPHIA,	HARTFORD,
CINCINNATI,	TEBO,
ST. LOUIS,	NEW HAVEN,
BUFFALO,	ROCHESTER,
BALTIMORE,	SPRINGFIELD,
MOBILE,	TOLEDO,
NEW ORLEANS,	ALBANY,
PITTSBURG,	COLUMBUS,
LOUISVILLE,	LAWRENCE,
ALLEGHENY,	MILWAUKEE,
MONTREAL,	SAN FRANCISCO,
QUEBEC,	CAMBRIDGE,

WASHINGTON, D. C.

The distinctive features of

**THE AMERICAN FIRE ALARM TELEGRAPH**

are a Combination of Circuits, the Automatic Signal Boxes, Electro-Mechanical Bell and Gong Strikers.

THE AMERICAN FIRE ALARM AND POLICE TELEGRAPH is covered by some twenty patents. Very early after its introduction into Boston, GAMEWELL & Co. purchased the original patents of FARMER & CHANNING, and during the past fifteen years have spared no expense or pains to improve and perfect this system.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

**THE STANDARD**

AMERICAN WORK ON THE TELEGRAPH.

MODERN PRACTICE

OF THE

ELECTRIC TELEGRAPH.

A HAND-BOOK FOR ELECTRICIANS AND OPERATORS.

BY FRANK L. POPE.

1 Vol., 8vo. Profusely Illustrated.

WHAT LEADING ELECTRICIANS AND TELEGRAPHERS SAY OF IT.

"Your illustrative diagrams are admirable, and beautifully executed."

"I think all your instructions in the use of the telegraph apparatus judicious and correct, and I most cordially wish you success."—Prof. S. F. B. MORSE.

"There is no other work of this kind in the English language that contains in so small a compass, so much practical information in the application of galvanic electricity to telegraphy."—Prof. G. W. HOUGH, Director of Dudley Observatory.

"I have read the book carefully through and have been both interested and instructed by it. It is just the sort of book that was wanted in America—clear and to the purpose."—ROBERT BARKIN.

"I feel assured that it will prove of great value to all interested in the science or practical details of the Electric Telegraph, and supply a deficiency that has long existed."—Gen. ANSON STAGER.

WHAT THE PRESS SAYS OF IT.

"There was a felt necessity for just such a work as Mr. Pope has given us. \* \* \* There are portions of the work which no operator can afford to be without."—*The Telegrapher.*

"From a careful perusal of this work we are assured that it supplies a long felt want. \* \* \* It will tend much to improve the knowledge of electricity and practical telegraphy amongst the operators."—*London Mechanics' Magazine.*

"We cannot err in commending the book to all who desire accurate knowledge in the art in which their life and labor are so much connected."—*Journal of the Telegraph.*

PRICE \$1.50.

On receipt of price, it will be forwarded by mail, post-paid, to any part of the United States or the British Provinces. Money sent by Post-office Order or Registered Letter, will be at the risk of the Publishers.

Orders may be sent to the Editors of the JOURNAL OF THE TELEGRAPH, THE TELEGRAPHER, or RUSSELL BROTHERS, PUBLISHERS, 28, 30, 32 Centre Street.

**STICKWELL & CO.'S**

EXTRA MUCILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUCILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

*Stickwell's Mucilage is KING of the Market. No other brand sells as well.*

IN QUARTS, PINTS, 8OZ. OONE, 8OZ. FLAT. 3OZ. OONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUCILAGE PACKED ONE DOZEN IN WOOD BOXES.

S. S. STAFFORD,  
Sole Proprietor.

**SPECIAL NOTICE.**

L. G. TILLOTSON &amp; CO.,

11 DEY STREET, NEW YORK,

AND

BLISS, TILLOTSON &amp; CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK,

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES,

with two Conductors, both plain and with braid outside, and a great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

Western Union Telegraph Company.

THE

**Journal of the Telegraph,**

A SEMI-MONTHLY PAPER,

DEVOTED TO THE

Interests of the Telegraph in the United States,

And a record of its progress throughout the world.

Published on the 1st &amp; 15th of each Month,

AT THE

EXECUTIVE ROOMS OF THE WESTERN UNION  
TELEGRAPH COMPANY,

145 BROADWAY, NEW YORK.

The JOURNAL OF THE TELEGRAPH is the official organ of the Western Union Telegraph Company, through which are promulgated, for the information of the Stockholders and public, authentic details relating to the financial affairs of the Company—embracing a monthly statement of earnings, expenditures and net profits—and the orders of the Executive Officers to the employees. In its columns will also be found accurate and valuable information in regard to the operation and extension of the lines, and a full discussion of all other matters of a scientific or general character pertaining to the telegraphic art.

Over five thousand copies of the JOURNAL OF THE TELEGRAPH are now issued, every Telegraph Office in the country receiving one, and many Stockholders and others being subscribers.

## TERMS OF SUBSCRIPTION :

One copy, one year.....\$1 00  
Five " " ..... 4 00  
Single copies, five cents.

## ADVERTISEMENTS

inserted at reasonable rates. All communications and remittances for the JOURNAL OF THE TELEGRAPH should be addressed to

James D. Reid, Editor,

145 Broadway, New York.

## Telegraphers' Mutual Life Insurance Association.

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

### DIRECTIONS TO APPLICANTS.

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage: and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Horner, Cashier, New York office. Whenever practicable it is desirable this should be done.

## CHARLES WILLIAMS Jr.

109 Court Street,

BOSTON, MASS.,

MANUFACTURER OF

TELEGRAPH INSTRUMENTS,

BATTERIES,

AND MATERIALS OF ALL KINDS.

WM. KIDD,

A. BOODY,

O. H. PEIRCE,

O. S. OTIS.

## KIDD, PEIRCE & CO.,

## S. S. STAFFORD'S

COMBINED

WRITING AND COPYING FLUID,

Labeled by me, for the last ten (10) years, *ARNOLD'S FLUID*

Superior to any Fluid used. It is Greenish Blue in color, turning Jet Black, flows freely, dries rapidly, does not set-off in books, gives one or more excellent copies. Has no sediment, can be used to the last drop. It is 83½ per cent. cheaper than any other (so called) combined ink. Used exclusively by the Western Union Telegraph Company.

For sale by all Stationers and Druggists, and at No. 11 Cedar street, New York.

S. S. STAFFORD,  
Chemist, N. Y.

## A. S. CHUBBUCK.

HOTEL STREET,

(Adjoining the Post Office.)

UTICA, N. Y.

Manufacturer of

Telegraph Instruments, Batteries,

and every description of

TELEGRAPH SUPPLIES.

INVENTOR OF THE

"PONY SOUNDER," REGISTER AND KEY.

Every Article Warranted of the

BEST MATERIAL AND WORKMANSHIP.

The Oldest Establishment in the United States.

## CHAS. T. & J. N. CHESTER,

104 CENTRE STREET, N. Y.,

TELEGRAPH ENGINEERS,

And Manufacturers of

INSTRUMENTS, BATTERIES,

AND EVERY DESCRIPTION OF TELEGRAPH SUPPLIES,

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

## CHESTER, PATRICK & CO.,

Manufacturers and Dealers in all kinds of

TELEGRAPH INSTRUMENTS AND SUPPLIES,

38 SOUTH FOURTH STREET, PHILADELPHIA,

Now offer for sale, or will manufacture to order,

REGISTERS,

RELAYS,

KEYS,

LIGHTNING ARRESTERS,

SOUNDERS,

SWITCHES,

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH,

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

## Improved Telegraph Wire.

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.

Agents in New York,

MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.

### THIS IMPROVEMENT

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

### THE WEIGHT OF THE COMPOUND WIRE

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its GREAT AND UNIFORM STRENGTH,

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

### THE WINTER TESTS

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Address—

WALTER O. LEWIS, Esq.,

Electrician of the Company.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET,  
PHILADELPHIA.

The guarantees of this insulator are:

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.

# JOURNAL OF THE TELEGRAPH.

VOL. II. NO. 24.

NEW YORK, NOVEMBER 15, 1869.

WHOLE NO. 48.

## A very Strange Story.

On the 18th of April, 1868, in the prison of Villarrica (Province of Minas-Geraes), in Brazil, two men named Aveiro and Carines were executed at the same time. In Brazil executions take place with closed doors, in the interior of the prison. Dr. Lorenzo y Carmo of Rio Janeiro, well known by savants for his remarkable works on electricity applied to physiology, his surgical skill, and his success in autoplasmic operations, obtained permission to profit by this event in order to experiment on the power of electricity, and to illustrate its analogy with some of the phenomena of life. The numerous experiments hitherto attempted have been made on the head and trunk separately. Dr. Lorenzo y Carmo's design was, if possible, to unite the head to the neck after decapitation. The heads of the two criminals fell within a few minutes of each other into the same basket—first that of Carines, then that of Aveiro. Immediately after this second execution a compression was effected by a pupil of Dr. Lorenzo on the carotid arteries of one of the heads so as to stop the hemorrhage. The body was then placed on a bed already prepared, and Dr. Lorenzo stuck the head as exactly as possible on the section and kept it in that position. The cells of a powerful electric pile were applied to the base of the neck and on the breast. Under this influence, as in former experiments, the respiratory movements were at once perceptible. As the blood which penetrated in abundance through the surface of the scar threatened to stop the passage of air, Dr. Lorenzo had recourse to tracheotomy. Respiration then ensued regularly. The head was fastened to the body by stitches and by a special apparatus. The physiologist wished to ascertain for how long a time this appearance of life could thus be artificially maintained. His astonishment was great when he saw that at the end of two hours not only did respiration still continue under the influence of the electric current, but that circulation had even resumed a certain regularity. The pulse beat feebly but sensibly. The experiment was continued without intermission. At the end of 62 hours it was evident to the astonishment of every one that a process of cicatrization had commenced on the lips of the section. A little later signs of life manifested themselves spontaneously in the head and limbs till then deprived of motion. At this moment the Director of the Prison, arriving for the first time in the experiment-room, observed that by a singular mistake, due to the haste of the operation, the head of Carines had been taken for that of Aveiro, and had been applied to the body of the latter. The experiment was continued notwithstanding. Three days later the respiratory movements reproduced themselves and electricity was suppressed. Dr. Lorenzo y Carmo and his assistants were stupefied—frightened at a result so unexpected, and at the power of an agent which, in their hands had restored life to a body whose right to exist the law had forfeited.

The learned surgeon, who had only had in view a simple physiological experiment, employed all his

skill to continue this work, which science, aided against all expectation by nature, had so singularly commenced. He assisted the progress of cicatrization, which progressed under the most favorable conditions. By means of an cesophagian probe liquid nourishment was introduced into the stomach. At the end of about three months the cicatrization was complete, and motion, though still difficult, became more and more extended. At length, at the end of seven months and a half, Aveiro-Carines was able to rise and walk, feeling only a slight stiffness in the neck, and a feebleness in the limbs.

## The Ceylon and Penang Telegraph Cable.

The following notice has been issued regarding a company introduced in August last for the construction of a light telegraph line from Ceylon to Penang, but which it was supposed had not succeeded in raising the required capital.

The India, Australia, and China Submarine Telegraph Company, have secured their capital, and the section between Ceylon and Penang will be commenced immediately by the India Rubber, Gutta Percha and Telegraph Works Company, at Silvertown, and it is fully expected that by sending it through the Suez Canal it will be in working order in April next.—*Engineering*.

## Telegraphic Communication with Australia.

The prospectus has been issued of the British Indian Extension Telegraph Company to construct the first important link of the communication between India and our Australian Colonies. This will consist of a cable of 1,756 miles between Ceylon and Singapore, the capital for which will be £460,000 in shares of £10. A contract has been made with the Telegraph Construction and Maintenance Company, who are to complete the work in the course of the coming year for £440,000, taking £130,000 in shares. The company will operate in connection with the British Indian Telegraph Company, with whom a tariff has been arranged by which the charge for a message of 20 words from England to Singapore will be £4 4s. of which the Extension Company will receive £1 7s. It appears that of the whole messages passing over the Indo-European lines hitherto, about one-fifth have been for Australia, China, Singapore, Java, and other places beyond Galle, and the calculation of the directors is that 75 messages each way may be expected daily, which, after deducting working expenses and a provision for a reserve fund, would yield 16 per cent per annum. Meanwhile negotiations are in progress with the Dutch and Australian authorities for concessions, and soundings are about to be taken for a cable route from Singapore to Hong Kong. Mr. Masser, late Finance Minister in India, is the chairman of the company, and Colonel Glover, Director General of Telegraphs in India is a member of the board. The subscription list is to be closed on Monday next for London, and at noon on Tuesday for the country.—*Engineering*, October, 22.

## Non-existence of the Electric Fluid.

[Extract of a Lecture given before the Rensselaer Polytechnic Institution, Troy, N. Y., by PROF. VANDER WEYDE, M.D.]

In the same manner that the investigations and discoveries of twenty years ago have proved that the so-called caloric fluid has no existence, and that heat is only a state of matter—a mode of motion of its particles; so the investigations of the present day prove that the so-called electric fluid has no existence, and that even electricity is nothing more than a state of matter—another mode of motion of its molecules. Without matter there is no electricity, as will be proved by this little glass tube, in which the vacuum is so perfect that no electricity can possibly pass through it, notwithstanding the ends of the two platinum wires melted in the glass, and projecting outside on both ends, and which conduct the electricity interiorly, are only one quarter of an inch apart. I have here a similar tube filled with common atmospheric air, the ends of the wires are also one quarter of an inch apart, and may be separated a half or a whole inch, but the electric current will be seen in the form of sparks to pass easily between the wires, and to charge this Leyden jar. I have here also a so-called Geisler tube, in which the ends of the wires are separated to the distance of twenty inches, and through which the electric current could not pass at all while filled with air; but the air in it is rarefied to such a degree as to make it a good conductor of electricity, and you see the current pass not in sparks, as in the second tube filled with common air, but as a glowing fire, resembling the northern light; through this tube also we can charge this Leyden jar. Through the first tube, in which, by great precautions, an almost perfect vacuum has been produced, there is not only no current seen to pass, but it is impossible to load this Leyden jar when the tube is interposed between the jar and the machine developing the electricity.

The verification of the passage or non-passage of the electric current by means of this charge in the jar, obtained or not obtained, is important, as otherwise it would be doubted if the electricity passed invisibly through the vacuum.

This striking and novel experiment, demonstrating the impossibility that an electric current can overlap a really empty space, even to the small distance of only one quarter of an inch, proves that there are two errors in our present theory of electricity. First, that the transmission of electricity in vacuo, so called, is really a transmission through rarefied air or gas, these being good conductors; common air, we know, is a bad conductor. The vacuum is proved by this new experiment to be an absolute non-conductor. Secondly, this experiment proves that if that which we call electricity was really a fluid distinct from common matter, there is no reason why it should not overlap the small empty space of a quarter of an inch. As we saw, however, that electricity cannot possibly overlap that small space, nor be transmitted

where no matter exists, we are forced to the conclusion that the phenomena of electricity are not due to a peculiar fluid, which moves rapidly through conducting media, but that the propagation is effected by peculiar motions of the molecules, which, being rapidly transmitted from molecule to molecule in the conducting body, form that which we call electric currents. In short, that electricity is transmitted like sound, by some kind of waves, undulations, or rotations, only with much greater velocity. In fact, there exists as little necessity to adopt a special electric fluid to explain the electric phenomena, as there exists to adopt a special sonorous fluid to explain the acoustic phenomena.—*Scientific American*.

### Electric Loom.

This extremely ingenious contrivance, in which the usual Jacquard cards are replaced by an electrical arrangement, worked by a pattern prepared in tinfoil with insulating varnish, is the invention of Cav. G. Boneli, Turin.

A simple metal plate, perforated with holes, each of which is provided with a kind of piston, successively plays the part of each successive paper card in the usual arrangement. The pistons fill up every hole that is not required, but are withdrawn by electromotors from those holes which require at each beat of the loom to be kept open. This is effected as follows:

A sort of metal comb, each tooth of which is the terminal of a separate insulated conducting wire, rests on the prepared pattern. Whenever a tooth touches the tinfoil, a circuit is completed through its conducting wire; but where a tooth rests on the varnish, the circuit is broken. Each conducting wire includes in its circuit an electro-magnet. The pistons already spoken of are each composed of a small soft-iron shank, and brass button-shaped head, and are all held horizontally in a frame, one opposite each electro-magnet. In one position of this frame, the heads of these pistons project through the openings of the metal card or perforated plate; the diameter of each pole is a little larger than the head of the corresponding piston, each piston being exactly in the center of its corresponding pole. In this same position all the soft-iron shanks touch the poles of the corresponding magnets, and the metal comb rests on the prepared pattern. A certain number of the electro-magnets corresponding to the uncovered portions of the tinfoil, are therefore active or attract the shanks, but the others exert no attraction. The frame with the pistons is now pulled forward away from the magnets; those pistons which are opposite the active magnets are held back, sliding in their frame, so that their button-heads pass behind the perforated plate; but the other pistons come forward with the frame leaving the magnets. The perforated plate then drops a little way, and by this simple contrivance all those piston-heads that were in front of the plate are retained there, whatever pressure comes against them, for they are now eccentric from the poles. The plate in this condition presents a perfect analogy with the common prepared card. A certain number of holes corresponding to the metallic part of the pattern are vacant, the rest of the holes are blocked up, and present an unbroken surface by which the proper hooks of the Jacquard loom are acted on during one stroke. The perforated plate is then brought back to the position first described, the prepared pattern is moved on a little step, and the same process repeated.

When shuttles with several different colors are to be used the pattern is subdivided into insulated portions corresponding to the separate colors, by removing a very thin outline of foil round each; all the parts corresponding to one color are afterwards connected.

As each shuttle is thrown, the battery is brought in contact with the appropriate series of insulated patches

of tinfoil, producing a succession of different cards, and the pattern is not shifted forward until all the colors are exhausted. After the completion of each fresh combination on the perforated plate, the battery circuit is broken by a proper contact-breaker, and the injurious spark is thus avoided, which would otherwise occur when the comb is lifted from the pattern prior to a shift.—*The Student's Text-Book of Electricity*.

### Tin a Substitute for Copper.

NALLIGO, Cal., October 26, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

The following, if it is as new to the rest of the telegraphic fraternity as to myself, may be worthy of a place in your columns. Out here on the Pacific Coast the Hill local battery is used quite extensively (and by the way, I think it as good as the best). A short time since having occasion to use an extra battery, while projecting with "double transmission" and not having the necessary copper plates, I, as an experiment tried a set made of ordinary tin plate cut to the required shape, attaching thereto the insulated wire in the usual manner, and found them to work fully as well, if not better than the copper ones. I have been making a test of the two batteries, comparing them as to economy, strength of current, constancy and cleanliness, and now after a considerable time of steady work the battery with tin plates is *not second* in any respect, and I have no doubt but that if tin plates were used in Daniell's and other similar batteries the results would be the same, but I have as yet had no opportunity of trying them with it.

Now, if after a thorough test it is proved that the tin plate answers all the purposes of copper ones in local batteries, it would undoubtedly be no small economy in telegraph companies to substitute tin for copper, the cost of one being but a trifle compared to the other.

At some future day, if it will not encroach too much upon your time, space and patience, I will give you the details, drawings, &c., of my "Ocean Cable Sounder" of which I wrote you sometime since.

Yours, truly, C. T. D.

We shall always be glad to hear from you. Practical suggestions are always welcome, and will have a cordial reception in the JOURNAL.—ED.

### A Paper on Sounders.

EDITOR JOURNAL OF THE TELEGRAPH:

To begin, let me ask you how much brains have been employed in the planning of any of our instruments used solely for the purpose of sounders, in order to get the greatest possible amount of sound for the power used?

This is a poser for me, for no sounder that I have seen has anything about it to promote the production or economy of sound.

It is an absolute misnomer to call them sounders. To prove this let me ask if we have ever had better sounders than the old fashioned wooden-base paper instruments?

There are many things to be taken into consideration to secure as much (and the right kind) of sound necessary, material, shape, weight, etc., etc. We would scarcely use two pieces of soft brass to strike out the clearest sharpest sound, steel is much better. A heavy armature is destructive of good sound. The inertia to be overcome is so great that a clumsy armature scarcely gets to moving briskly before it has reached its limit of motion. The point of striking ought to be "visible" to the ear, so that the sound could go in a straight line from where it is produced. As it is in most sounders it has to turn a corner or two.

Yours, &c.,

THEORY.

### Haven's Firm Contact Key.

NEW YORK, November, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

SIR.—You were kind enough to present to the readers of the Journal a description and, also, a sketch of my key for securing firmness in manipulating. I desire to say something of the merits of this apparently small, but *very important* improvement, as I will try to show it to be.

The following are common expressions made and heard by operators, the cause of which may be removed by the use of this key.

"Please write firmer."

"I can't make that out."

"I don't get your dots."

"Your writing don't come."

"Fix your key," etc.

Many times when the real trouble is that the writing is *too light*, an operator will presume that a repeater is out of adjustment, and much time is occupied in calling up the repeating station. Then there must be an exchange of words regarding the working of the wire etc., before the business in hand at the time of the interruption can be continued. Here is a great loss of valuable time, valuable not only to the telegraph company, but to those whose despatches are thus delayed.

It is much easier manipulating with this key, than those in present use, because it is not necessary that an operator should be particular in pressing the lever, or use an extra amount of strength in order to make sure of writing firmly.

On long lines and in wet weather when there is more or less "escape," operators know that they must write steadily and particularly firm; many think that both these cannot be effected unless they write very slow. There is therefore much time consumed by this way of operating, which I believe would be saved by the adoption of my key.

The patience of operators is often tried to the utmost, and the annoyances to which they have to submit are not trifles, and they get no sympathy from those who are not experienced. A key upon which they can rely to secure firmness in transmitting, no matter what style they adopt in making the characters is what they earnestly desire that they may not be disturbed by expressions such as those above quoted, and worried on account of the delay of business entrusted to them, for reasons which I have mentioned.

What I have said in favor of my key I believe it merits. Much more might be detailed, but I intended to be brief and will now forbear, and submit the matter to all interested in this simple and time saving improvement.

Respectfully,

W. C. HAVENS.

### Bulls, Oysters and Inventions.

PORTLAND, Me., October 30, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

DEAR SIR:—Here is the best bull yet. A corn and flour firm send back for explanation a message just delivered "Send twenty bushels mixed and ten yellow gal." One look at the copy and quite an *audible smile* goes round as it dawns upon us that Yellow Meal would make much better sense.

No peace for the receiver of that message till he "comes down" with the oysters.

But if this is to be stored up against us please give the Down Easters credit for three inventions within the last month.

Two new repeaters, each of which does away with "extra locals," and a key upon a new principle, all work admirably and of them more anon. E. O. C.

## A Practical Flying Machine.

A member of one of the oldest and most successful business establishments in this city, has been for several years experimenting with a flying machine that he has invented and is now sanguine will be entirely successful. Discarding entirely the common modes of meeting the difficulties of keeping the machine pendent in the air by some form of balloon, our Paducah inventor elevates his machine, and keeps it aloft, by mechanical means and the use of materials that combine strength with extension. His present machine, which may be called indeed a model, employs two engines, with two-inch cylinders, and its supporting and propulsive agency is a perpendicular shaft with two arms, to which beautiful wings are attached. These wings strike the air at about the same angle as the wings of a bird do, and operate more like screw propellers than the wings used on any other flying machine yet proposed. The steam was put on last Thursday in the presence of several competent machinists, and every thing worked in a satisfactory manner. The inventor is now engaged in ascertaining, by practical experiment, the exact lifting power of his machine. Those to whom he has exhibited it, are unanimous in their opinion that he will achieve the great feat of making a machine that will fly; will be elevated or depressed at pleasure; will go in a direction contrary to the wind, and will not need a balloon to give it buoyancy.—*Paducah Kentuckian*.

## Soldering Joints.

November 5, 1869.

EDITOR JOURNAL OF THE TELEGRAPH:

I have heard a superintendent of telegraph disapprove of the soldering connections on main line for the reason that it retarded the flow of electricity. This he maintained because the current solely flowed on the outside of the wire. I differ with him on the subject, holding that in every respect it will improve the conductivity of the wire, but not being well versed in the matter, I desire your opinion on the subject.

Yours, Truly,

W. H. R.

[Although even good solder is relatively a poorer conductor than the iron wire, yet it performs a most useful office in preventing rust supervening at joints, and thus gradually destroying that perfect metallic connection so necessary to the easy action of a telegraph line. But although very inferior to iron as a conductor and even admitting that electricity passes solely on the surface of the wire, we do not believe it retards the current, as it usually has not only greater bulk than the iron, but preserves a bright surface.

The best tin solder should however, always be used so as to give the current every possible advantage. Its use, we believe, should be every where insisted upon to preserve the integrity of joints, however carefully made. To depend on solder, however, as a conductor, using it to spread over a bad wire joint, is pernicious. Most solder is composed largely of lead, which is a poor conductor, and should never be so employed.

**TUNGSTEN STEEL MAGNETS.**—C. W. Siemens, F.R.S., stated in a recent letter that the metal tungsten mixed in small proportion with steel increases the power of the latter for retaining magnetism. A horseshoe magnet of ordinary steel weighing two pounds is considered of good quality when it sustains seven times its own weight. The famous Haaslem magnet supports thirteen times its own weight. But Mr. Siemens has succeeded in producing a horseshoe magnet of tungsten steel which will hold twenty times its own weight suspended from its armature.

## Southern Division.

At the annual meeting of the Telegraphers' Mutual Life Insurance Association, held in New York, Friday, November 5th, James D. Reid, was re-elected Treasurer, and Gerritt Smith, Secretary. Mr. Smith is well known as one of the oldest and best operators in the country, and a most excellent and amiable gentleman. Mr. Downer has worked long and hard for the Association, and now becomes a member of the Executive Committee.

## EXECUTIVE COMMITTEE.

A. S. Brown,  
R. H. Hill,  
D. R. Downer,  
Gerritt Smith,  
J. D. Reid.

The reports of the officers will be given in our next number.

## Faraday on the Government Recognition of Science.

The Parliamentary Committee of the British Association applied to Faraday through Lord Wrottesley for his opinion whether any and what measures could be adopted by the Government or the Legislature to improve the position of science, or of the cultivators of science, in this country. He answered:—"I feel unfit to give a deliberate opinion. My course of life, and the circumstances which make it a happy one for me, are not those of persons who conform to the usages and habits of society. Through the kindness of all, from my sovereign downwards, I have that which supplies all my need; and in respect of honors, I have, as a scientific man, received from foreign countries and sovereigns those which, belonging to very limited and select classes, surpass in my opinion anything that it is in the power of my own to bestow. I cannot say that I have not valued such distinctions; on the contrary, I esteem them very highly, but I do not think I have ever worked for or sought them. Even were such to be now created here, the time is passed when these would possess any attraction for me, and you will see, therefore, how unfit I am, upon the strength of any personal motive or feeling, to judge of what might be influential upon the minds of others. Nevertheless I will make one or two remarks which have often occurred to my mind. . . . A Government should for its own sake, honor the men who do honor and service to the country. The aristocracy of the class should have distinctions which should be unattainable except to that of science. . . . But, besides, the Government should, in the very many cases which come before it, having a relation to scientific knowledge, employ men who pursue science, provided they are also men of business. This is, perhaps, now done to some extent, but to nothing like the degree which is practicable with advantage to all parties. The right means cannot have occurred to a Government which has not yet learned to approach and distinguish the class as a whole."—*From the Obituary Notice of Faraday in the Proceedings of the Royal Society*, vol. xvii, p. lv.

## The Great Eastern.

The Great Eastern Steamship is being prepared for sea with all expedition. A great portion of the Anglo-Indian cable has been coiled into the tanks, and she was expected to sail about the close of October. About one foot thickness of muscles had accumulated on portions of her bottom which took six weeks to remove.—*Engineering*.

**A NEW BATTERY FOR BLASTING.**—The *American Exchange and Review* for August describes a little pocket battery which, apparently, has capabilities worth the notice of mining engineers. It is circular, about six inches in diameter, and one inch thick; and by simply turning a small handle like that of a tape measure, a gutta-percha disk within is made to revolve against oiled silk, causing sufficient friction with ten turns to produce a spark which will ignite a small cartridge at the end of a double wire. The journal aforesaid says this little instrument was used in firing the cannon at the Boston musical festival. It acts with perfect promptness in blasting under water.

Those persons who do most good are least conscious of it. The man who has but a single virtue or charity, is very much like the hen that has but one chicken. That solitary chicken calls forth an amount of clucking and scratching that a whole brood seldom causes.

## Journal of the Telegraph.

This Journal will be issued on the 1st and 15th of each month commencing with December 1, 1887. It commences with an issue of 4,000. The Western Union Telegraph Company have ordered 3,000 copies for its officers and offices. All its 5,000 stockholders will require it for information of interest to them. So of other telegraph companies and their stockholders.

### TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JAMES D. REID, Editor,  
Executive Rooms, Western Union Tel. Co.,  
145 Broadway, New York.

NEW YORK, NOVEMBER 15, 1889.

### Close of Volume II.

With this number the second volume of the JOURNAL closes. On reading this announcement, let the first practical thought be to enclose one dollar for Volume III, and if any are conscious of being delinquent, we suggest the duty and the satisfaction of enclosing two dollars instead of one to make sure that all is settled, and your right to the reception of the JOURNAL during the coming year duly established. Certainly no neater, cheaper paper enters the office or home of any who receives it; and, although it is not for us to boast of its contents, or the value of its editorial matter, we know that the former have been provided carefully and the latter conscientiously. We have used the editorial pen to stimulate good will among the craft, and to inform correctly those they serve. We have endeavored to perform our appointed duties with as much propriety and cheerfulness as is possible to us, and have succeeded, we think, in a modest degree, in rendering the JOURNAL welcome, and, perhaps, useful. Such, at least, has been our most anxious desire.

To this estimate of our success we have come from the numerous testimonials of many we have never seen, as well as from those dictated by the partiality of personal friendship. We receive both as a stimulant to increased effort to render the JOURNAL more powerful for good, more stimulative of invention, more generous in its sympathy with labor, more persistent in its advocacy of the equities of authority and toil than ever.

Now we desire to commence the new volume with all the old family faces around our table, and as many new ones as choose to come. There is abundant room and a warm welcome, although many thousand now sit at our family board. The table also will have increased plenitude and variety. We will divide every good thing we have or can procure. Come. *But don't forget the dollar.*

### Is Telegraphy as a Pursuit Healthy?

It is a legitimate inquiry for every young man who proposes to engage in any pursuit new to him, "can I do so and preserve my health?" If health can not be secured, the vocation he has proposed to himself should be abandoned. The loss of health is the loss of everything. The gold of the Rothschilds is earned too dearly at such a cost. Good health is sunshine, happiness, wealth, influence, good thoughts, robust understanding, glory! Nothing can compensate for its loss. When the laugh of health is drawn out of a man, and the eye becomes weary and the step heavy, his thoughts gravitate to the grave and his feet follow his thoughts. But, alas! many can not choose their occupation. They have to enter the first door which opens to them whether the stairs within wind up or down. He is happy who enters early in life pursuits congenial to him, which he may follow with ardor, and pursue with success, in which a pleased brain may work its chosen career chaperoned by a healthy body and stout stomach.

The death of ten operators who had connected themselves with the Telegraphers' Mutual Life Insurance Association during the two years of its organization, has been made the basis of an alarm as to the influence of the business of telegraphy upon health. We think the argument utterly unfair. The association in its origin was taken hold of, less as an insurance association than an organization of benevolence to prevent the circulation of begging subscriptions, for the aid of families to whom bereavement was an expected event. It was deemed a good thing then, as many still feel, to admit those whose lives were already broken, to invite to membership those whose steps were nearing the green bed where all must ultimately rest. They came in, and have died in peace because of the aid thus given. A few who joined the association have wearied of their work and left, but nearly six hundred of the best men in the business, good and true hearted, have taken an increasing pleasure in a work which returns them four fold enjoyment, beyond what its cost would bring them from any other source. Yet the rate of death even under these circumstances is not unusual. The post office organization of a similar kind lost more members within a similar period with a membership almost the same. The mortality has been less than one per cent. per annum, and no one should expect a better result in any similar organization.

We believe the business, in the main, healthful as a sedentary pursuit can be made. It is certainly, in itself, cheerful. An operator has always company. It remains, however, for every operator, as for every one engaged in sedentary pursuits, to choose such food and take such exercise as are adapted to such a life.

To the members of the insurance association we offer our right hand for the noble work they have accomplished, and trust it may continue attractive to them. Every member should calculate on requiring fifty cents per month to meet the claims of death upon him, and make a reservation of that amount for the assessments as they are made.

### Atlantic Cable Rates.

The cable rates to be followed by offices are those found in the issues of September 1 and November 1 of the JOURNAL OF THE TELEGRAPH, and to which we are requested to draw attention.

### Death of Hon. Amos Kendall.

As we are closing the records of the year, there comes to us a message announcing that Hon. Amos Kendall died at his residence in Washington, D. C., Friday morning, November 12, at 8 o'clock. We receive the tidings with filial sorrow. Mr. Kendall's personal kindness to us will never be forgotten. To him the Telegraph in America owes much, and by all its pioneers Mr. Kendall's death will be deeply deplored. A year ago he united in the banquet to Prof. Morse, and deserved a testimonial almost equally great. Such a tribute many of us would have gladly paid him. But he rests now after a long and honored life. Farewell, dear old friend! A few days more and we will follow thee.

"Death is the crown of life."

JOHN BUTTERFIELD died at Utica Sunday evening, November 14. Thus another friend has gone to his rest. How fast they are passing away!

PARIS, November 6.—The concession for the proposed cable between the United States and Belgium, was signed yesterday in this city by the Belgian Minister. The grantees are W. C. Barney, E. E. Paulding, and J. S. Bartlett. The cable is to be laid from Ostend to some point between Maine and Georgia by an American Company.

CONGRESS will open with new schemes for governmental telegraphs. Bills and pamphlets are ready to fire away with as soon as the ball opens.

THE Hughes instrument, with its capacity largely increased, has been introduced into a number of French main offices.

CONNECTION between Germany and the United States is proposed to be made by leasing one of the wires of the Atlantic Cable. Count Reichenbach favors the scheme, and, as he is in charge of the enterprise, it may be accomplished in that way. Should the Atlantic Cable Company favor this arrangement, they will then owe it to themselves to lay a new cable to some point more in direct connection with the great commercial lines of the country, although their business is now done with admirable precision and promptitude.

Extract from "Chas. Schurtz's" letter about Brigham Young, Salt Lake:

"In his house is a telegraph bureau, in which concentrate 500 miles of lines, which inform him in the most precise manner of what passes in the various settlements of the Saints."

WE have received from Mr. W. E. Davis, telegraph machinist, corner South Fourth and Newark avenue, Jersey City, the handsome set of instruments exhibited by him at the late American Institute Fair, of which we took notice in a preceding number. It is a handsome gift, for which we are duly grateful.

Mr. Davis designs to carry on the manufactory of telegraphic and philosophic machinery in which he has had a long experience. We trust he may have all the success his industry and ability merits.

THE Submarine Telegraph Cable between Sweden and Finland (points of Grisslehamn and Nystad) is now safely laid, and by means of it a shorter, more convenient and better connection has been established, not only with Finland, but with all the Russias.

**Self-closing Keys.**

A large number of plans for self-closing keys have been sent to us, all of which we have designed to illustrate and describe. We have been prevented from doing so, partly, because they have been so numerous, and partly, because, when inclined to speak well of an invention, it usually has had the effect of causing the inventor to spend money in patenting his idea, spending we have conscientiously thought might have been much more usefully employed. An inventor should always inquire whether his invention is so needed as, probably, to cause a demand, and, in the case of telegraph keys, whether the means of accomplishing an automatic closing are not so numerous, as to make it of doubtful value to patent any one of them. Now with every wish to treat all such appliances kindly and respectfully, we must assure all that we do not perceive any such advantage in any one of them, or in anything to accomplish this purpose in the present mode of using the circuits, as to be of any pecuniary value to the inventor, or likely to be adopted by companies.

The only really practical and complete mode of securing the closing of keys is the plan of Mr. Frey, which we published some time ago. It is perfect of its kind, sure, and economic. It proposes simply to reverse the adjusting screws of the magnet, placing the platinum point at the back, and reversing also the anvil of the key, making it above, instead of below the arm of the key, and closing the circuit with the back stroke. The manipulation of the key, therefore, in transmission, will be on an *open circuit*, the opening of the key by the usual mode of closing it connecting the local circuit. Thus when the key is not in use, it returns, by the ordinary spring, to contact with the screw now used to adjust the space of the key's play, but which by this arrangement has become the anvil on which the circuit is closed. The closing of the key is thus not only assured, but every local battery is allowed to rest when the key is closed. In this arrangement there is not only certainty but great economy.

Since writing the above we have received the following note from the engineer of the Compania Nacional Telefonica, Lima, Peru, which amply confirms all we have previously said in favor of a system so obviously excellent and economic.

EDITOR JOURNAL OF THE TELEGRAPH:

LIMA, Peru, September 27, 1869.

SIR: The many ingenious but apparently fruitless attempts made by the U. S. telegraphists to invent a self-closing key have caused me some surprise, a simple and complete solution being in daily operation in South America where it has replaced with advantage the North American system, and works to perfection.

The "circuit closer" is entirely dispensed with, the lever of the key itself performing that duty and the local battery only brought into action when signals are transmitted. The connections are arranged so that signals are written by *opening* instead of *closing* the line circuit, the key re-establishing the circuit by means of the usual spring, immediately the operator's hand is removed. Here you have a self-closing system without complication or difficulty, offering the obvious advantages of security and economy in local power, as one half is saved by this arrangement.

Perhaps yourself, sir, or some correspondent will inform me if this system has ever been tried in America, and if not, why not?

Your Obedient Servant,  
ENGINEER.

**Executive Order No. 84.**

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
145 Broadway, New York,  
NOVEMBER 13, 1869.

Referring to Executive Order No. 25, it is now ordered that:

Scranton, Pa., East Liberty, Pa.,  
Fall River, Mass., Columbus, Ga.,  
be, from and after this date, added to the list therein designated as Night Offices.

WM. ORTON, President.

**The Campbells Are Coming.**

The reception of cards bearing the well-known post mark of Carlisle, Pa., informs us of the marriage of our old friend John Campbell. It seems as if the world and those who dwell therein were growing young. We hope our good old friend and his companion, Miss Annie E. Bitner, now Mrs. John Campbell, may live long and happily, and be able to sing as each anniversary of the wedding day comes round.

"The Campbells are coming."

**The Chicago Pneumatic Tube.**

There have been, in times past, a large number of wires from prominent points throughout the country leading directly into the Chicago Board of Trade Hall, but the available room has been too limited to admit of all the absolutely necessary connections. In order to avoid this, the Western Union Company, some time since, applied for permission to construct a pneumatic tube, which would do away with the telegraphic apparatus in the hall. The arrangement consists of a heavy brass tube, three inches in diameter inside, and one hundred and thirty-five feet in length, being put together in sections with rubber packing at the joints, so as to be rendered perfectly airtight. One end reaches into the telegraph operating room and the other into the Board of Trade Hall. The function of the tube is the transmission of telegraphic messages between the two points by means of air pressure. The message, after being written out, is folded and placed in a circular leather cup of suitable diameter to fit the tube, and the cup is then placed in the mouth of the tube and swiftly forced by air to the opposite terminus. The air is supplied by a bellows of ordinary construction, situated at one end, by which the cup is shot over into the Board of Trade Hall, just as a boy would blow his paper wad through a glass tube. Then the suction of the bellows brings the cup back.

The advantages of the system are plainly evident by rendering telegraphic connection unnecessary. Competent messengers will be on 'Change to deliver dispatches to members. Under the present admirable system the receiver takes the message, numbers and records by a consecutively-numbering stamp—which was invented by the President of the Company, and is a marvel of ingenuity—folds and places it in one of a number of the leather cups ready at hand for the purpose, places in the tube, gives a turn at the bellows-crank, and in less than ten seconds from the time it left the receiver's hands the document has traversed four stories and is in charge of the operator. The old process consumed at least two minutes—a terrible waste of time in a telegraph office where 1,500 messages per day are transmitted and delivered. The cost of the apparatus, about \$3,000, is borne by the Western Union Telegraph Company, to whose far-reaching enterprise and desire to supply every possible convenience in the domain of telegraphy, is due its inception and completion.—*Tribune*.

**Married.**

WHEAT-STAFFORD.—On Sunday, October 24, at Maysville, Mo., by Rev. John Stafford, of Minnesota Conference, Joseph H. Wheat, of W. U. office, Breckenridge, Mo., formerly manager W. U. office Sir John's Run, W. Va., to Miss Annie Stafford, of Maysville, De Kalb County, Mo.

**Died.**

At Hellertown, Pa., October 30, after an illness of three weeks, J. D. Bennett, clerk of the Saucon Iron Company, and assistant operator, office of Western Union Telegraph Company.

**TARIFF BUREAU.****Semi-Monthly Circular.**

EXECUTIVE OFFICE,  
Western Union Telegraph Company,  
145 Broadway, New York,  
NOVEMBER 15, 1869.

To all Offices on W. U. Lines:

The following changes in tariff have occurred since November 1, the date of the last tariff order. Please note them in your tariff book:

**NEW OFFICES.**

339 Belmont, Mo.	437 Norborne, Mo.
369 Bridgeton, Mo.	* Perkiomen Junco, Pa.
* Colorado, Pa.	294 Randolph, Ala.
Cooperstown Junco, N. Y.,	455 Red Oak, Iowa.
tariff same as Colliers,	437 Richmond, Mo.
N. Y.	98 Rocky Point, N. C.
369 Eureka, Mo.	369 St. Paul, Mo.
Fort Shaw, Montana, 4.50	Snake River, Idaho, re-
more than Omaha, Neb.	opened, tariff as hereto-
* Frackville, Pa.	fore.
97 Fremont Station, N. C.	130 Spring Creek, Pa.
* Locust Summit, Pa.	* Stanhope Furnace, Pa.
57 New York Mills, N. Y.	88 Warsaw, N. C.
* William Penn, Pa.	

**NEW OFFICES ON OTHER LINES.**

Tariff for other lines.	Leaves this line.
Colorado, Pa. .... 35 3	Philadelphia or Harrisburg.
Frackville, Pa. .... 35 3	" "
Locust Summit, Pa. .... 35 3	" "
Perkiomen Junco, Pa. .... 35 3	" "
Stanhope Furnace, Pa. .... 35 3	" "
William Penn, Pa. .... 35 3	" "

**OFFICES CLOSED.**

Beverly, N. J.	Guyaboro, N. S.
Covington, Va.	Mt. Olive, N. C.
Cape Canso, N. S.	Mercersburg, Pa.
Colliers, N. Y.	Putney, Vt.
Delmar, Del.	Southbridge, Mass.
Durant, Miss.	Sloatsburg, N. Y.
	Tusket, N. S.

**GENERAL INFORMATION.**

Business for Dunmore, Pa., should be checked to Scranton, Pa.

Ten cents for delivery should be charged on messages for Dexter, Me.

Newburgh, N. Y., is an "Other Line" office, and should be checked as such hereafter. Tariff and point where business "leaves this line" same as Chester, N. Y.

The new name for Coffins Station, Ind., is Dunrieth, Ind., and that of Dement, Ill., is Creston, Ill.

Offices in District I, and offices in square 76, District K, will hereafter send and check business for the following points on Erie Railway line to New York City at the rates for "Other Lines" here given:

Addison, N. Y. .... 70 5	Forestville, N. Y. .... 75 5
Adrian, N. Y. .... 70 5	Friendship, N. Y. .... 75 5
Alden, N. Y. .... 75 5	Gainesville, N. Y. .... 70 5

WILLIAM ORTON, President.

**CHESTER, PARTRICK & CO.**

Manufacturers and Dealers in all kinds of

**TELEGRAPH INSTRUMENTS AND SUPPLIES,**

38 SOUTH FOURTH STREET, PHILADELPHIA,

Now offer for sale, or will manufacture to order,

**REGISTERS,****RELAYS,****KEYS,****LIGHTNING ARRESTERS,****SOUNDERS,****SWITCHES,**

And every variety of Instruments now in use. Among the supplies constantly kept on hand, are the following:

Battery Materials of all kinds, Line Wire, all sizes, Brackets, Insulators, Medical Batteries (Induced or direct current), Fire and Burglar Alarms for Banking Houses and Private Residences, as well as for Cities and Towns; also, Contractors for the Construction, Reconstruction and Repair of Telegraph Lines throughout the United States.

All the Standard Works on Telegraphy furnished at the lowest prices, among which is the latest work of

**MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.**

By Frank L. Pope.

Also, Electro-Platers' Batteries and Materials, Blasting Apparatus, Cartridges and Patent Portable Machinery for the manufacture of Nitro Glycerine.

All orders executed with promptness, and satisfaction guaranteed in the quality of articles supplied.

**Improved Telegraph Wire.**

The attention of Telegraph Companies and Builders is invited to the Compound Steel and Copper Wire manufactured by the

**AMERICAN COMPOUND TELEGRAPH WIRE COMPANY.**

Agents in New York,

**MESSRS. L. G. TILLOTSON & CO., No. 11 Dey street.****THIS IMPROVEMENT**

has already been quite extensively introduced, and it is confidently believed, that by the natural laws of progression, is destined to supersede iron wire for Telegraphs, because of its superior working capacity under all conditions of weather.

**THE WEIGHT OF THE COMPOUND WIRE**

is but about one-third that of an equivalent conductor of iron, and its conducting capacity may be largely increased with but slight increase of weight. In consequence of this lightness, together with its

**GREAT AND UNIFORM STRENGTH,**

but one-third of the number of poles are necessary that are required in iron wire construction, thus largely improving the insulation and combining Economy in Construction and Reconstruction, with superiority in working.

**THE WINTER TESTS**

have proved its durability and capacity to successfully resist breakage from sleet and wind storms, and one of the testimonials received to this effect states that during a certain severe sleet storm the Compound Wire remained intact, while a high cost Norway Iron Wire, in the same locality, and strung at the same time, was broken in several places.

Offer the best guaranty of excellence in their profession—in their long established business—in the extent and variety of their manufacturing facilities—in the many improvements introduced by them, now almost universally adopted or imitated—and in the extent of their business, domestic and foreign, enabling them to keep pace with telegraphic progress.

They publish an Illustrated Descriptive Catalogue of their leading manufactures, to which they respectfully refer.

**Telegraphers' Mutual Life Insurance Association.**

INCORPORATED UNDER THE LAWS OF THE STATE OF NEW YORK.

I. This association shall be known as the Telegraphers' Mutual Life Insurance Association, and be organized under the general State law of the State of New York.

II. Its officers shall consist of a Treasurer and Secretary.

III. There shall be an Executive Committee of five, of which the Treasurer and Secretary shall be members, who shall exercise a general supervision over the affairs of the association and decide all questions which may arise.

IV. No officer shall, at present, receive any remuneration for his services.

V. No expense of any kind will be allowed except for expenses of incorporation, stationery, postages, circulars, certificates and advertising.

VI. Any person, regardless of sex or class, may become a member of this association provided they are or have been employed in the telegraph business and subscribe to these articles, and are unobjectionable to the Executive Committee.

VII. The initiation fee shall be one dollar and fifty cents, one dollar of which shall go to the contingent fund, and the balance to the expense account.

VIII. Upon the death of a member the Treasurer shall immediately, on application by the proper parties, pay over to them the fund which is on hand for that purpose, that is, the whole of the contingent fund on hand from the previous assessment.

IX. It shall be the duty of each member of this association to leave in writing, the name of his or her executor or heir, failing to do which the amount of insurance shall be used, first, to pay the expenses of burial, and the balance to be given to such relations of the first degree as are dependent on the deceased, or should there be none such, to be subject to the disposition of the Executive Committee for the benefit of the association.

X. Immediately on the decease of a member, the Treasurer shall assess each remaining member \$1, payable within thirty days of the issue of the assessment call, neglecting to pay which during the time specified, the delinquent shall forfeit all claims to membership or the benefits of the association, and he shall be restorable only on the unanimous vote of the Executive Committee and the payment of dues.

XI. A meeting for the election of officers shall be held annually during the first week in November in each year, who shall be elected to serve for one year or until their successors are elected. In case of the death of a member of the Executive Committee the remaining members shall have the power to fill the vacancy until the time of the annual election.

XII. Special meetings of the association may be called upon the written request of twenty-five members.

XIII. It shall be the duty of the Treasurer to receive all moneys, sign receipts, and pay bills and claims when audited by the Executive Committee. He shall give suitable bonds for an amount equal to twice the amount of money on hand at the time of his election.

XIV. The Secretary shall keep the records of the association, maintain such correspondence as is necessary with members, and issue such notices as may be necessary. He shall also aid the Treasurer in all matters in which he may require assistance.

XV. Certificates of membership shall be given, signed by the Treasurer and Secretary.

XVI. The books of the association shall always be open for examination by any member thereof.

D. R. DOWNER, Secretary.

J. D. REID, Treasurer.

W. O. LEWIS,

A. S. BROWN,

W. H. HILL,

Executive Committee.

**DIRECTIONS TO APPLICANTS.**

1. The number admissible as members of the Association at any one time, having been limited for the present to *fifteen hundred*, it is necessary to apply early if membership is desired.

2. Apply by letter, enclosing one dollar and a half and a three cent postage stamp for each application, to D. R. Downer, Secretary Telegraphers' Mutual Life Insurance Association, 145 Broadway, New York, and a certificate of membership will be sent by return mail.

3. Every applicant must be known to the Executive Committee, or to some responsible Manager of a Telegraph Office, and evidence of this, and of good character and of ability to work, must accompany each application. The endorsement of a reputable Manager will be regarded as denoting eligibility as stated, and the signature of the applicant, with date, amount and recommendation, will be all the form of application necessary.

4. Each applicant must file with the Secretary written directions respecting the disposition of the money to which he or she may be entitled at death.

5. No letters can be answered unless a stamp is enclosed for postage; and as the officers labor without compensation, correspondence requiring answers should be as limited as possible.

By permission of the Western Union Company, and to avoid risk by mail, remittances may be made by an order signed by a Manager on John Hermer, Cashier, New York office. Whenever practicable it is desirable this should be done.

THE  
**Journal of the Telegraph,**

A SEMI-MONTHLY PAPER,

DEVOTED TO THE

Interests of the Telegraph in the United States,

And a record of its progress throughout the world.

Published on the 1st & 15th of each Month,

AT THE

EXECUTIVE ROOMS OF THE WESTERN UNION  
TELEGRAPH COMPANY,

145 BROADWAY, NEW YORK.

The JOURNAL OF THE TELEGRAPH is the official organ of the Western Union Telegraph Company, through which are promulgated, for the information of the Stockholders and public, authentic details relating to the financial affairs of the Company—embracing a monthly statement of earnings, expenditures and net profits—and the orders of the Executive Officers to the employees. In its columns will also be found accurate and valuable information in regard to the operation and extension of the lines, and a full discussion of all other matters of a scientific or general character pertaining to the telegraphic art.

Over five thousand copies of the JOURNAL OF THE TELEGRAPH are now issued, every Telegraph Office in the country receiving one, and many Stockholders and others being subscribers.

TERMS OF SUBSCRIPTION :

One copy, one year.....\$1 00  
Five " " ..... 4 00  
Single copies, five cents.

ADVERTISEMENTS

inserted at reasonable rates. All communications and remittances for the JOURNAL OF THE TELEGRAPH should be addressed to

STICKWELL & CO.'S

EXTRA MUOILAGE

THICK, CLEAR AND ADHESIVE.

Who has not used

STICKWELL'S MUOILAGE?

That man must be an old FOGY who prefers any other to it. It is a household word. It sticks the letter stamp which Uncle Sam has forgotten to coat with gum. It mends the babies' dolls and furniture when broken. It saves the purchase of China Cement when the parlor vase is smashed. It effectually closes the Envelope which the cheap stationer sells you as adhesive. It is as strong as glue prepared by Spaulding "or any other man." It is as cheap as the worthless trash sold under another name. It saves the pieces. It never SOURS or becomes THIN. Freezing does not hurt it.

*Stickwell's Muilage is KING of the Market. No other brand sells as well.*

IN QUARTS, PINTS, 8OZ. CONE, 8OZ. FLAT, 8OZ. CONE, AND FLAT BOTTLES, WITH CAP AND BRUSH.

ALL MUOILAGE PACKED ONE DOZEN IN WOOD BOXES.

B. S. STAFFORD,  
Sole Proprietor.

SPECIAL NOTICE.

L. G. TILLOTSON & CO.,

11 DEY STREET, NEW YORK.

AND

BLISS, TILLOTSON & CO.,

171 SOUTH CLARK STREET, CHICAGO, ILL.,

Respectfully inform their customers, and all parties purchasing

TELEGRAPH AND ELECTRIC MATERIALS,

that they have been appointed by

SAMUEL C. BISHOP, OF NEW YORK.

General Agents for the sale of any articles manufactured by him

FOR TELEGRAPHIC AND ELECTRICAL USE.

They are now prepared to fill promptly any orders for goods on hand, or to be manufactured, at Mr. BISHOP'S prices in New York. The long experience of Mr. BISHOP in the manufacture of

'PURE GUTTA PERCHA GOODS,

and the reputation he has gained and enjoys for the superior quality and perfection of manufacture of his

SUBMARINE TELEGRAPH CABLE

AND

INSULATED WIRES,

of various kinds, insulated with pure Gutta Percha, renders this arrangement a very important one for our numerous patrons throughout the country, and we confidently recommend these goods to their especial notice as being fully equal, if not superior, to any other in use.

The principal articles manufactured and offered for sale are

SUBMARINE TELEGRAPH CABLES,

(Any size required.)

Gutta Percha Covered Telegraph Office Wires, in great variety of size and style.

Subterranean Wires, covered with Gutta Percha and Lead outside, various sizes.

Subterranean Wires with Gutta Percha and braided fibre, and Bishop's Patent Compound outside.

Subterranean Wires, with Fibre and Bishop's Patent Compound outside.

Pole Line Cordage, with Fibre and Bishop's Patent Compound outside.

Bridge's Patent Electric Cordage.

Bridge's Patent Double Covered Cordage.

BISHOP'S PATENT COMPOUND WIRE

for out-door use and office connections.

INSULATED WIRES.

with two Conductors, both plain and with braid outside, and great variety of other kinds made to order.

Cotton and Silk-Covered Wires, both twist and braided.

This arrangement with Mr. BISHOP, together with our own extensive Manufactory in New York, and our great variety of Telegraph Material in stock, fully establish our claim that our stores are the depots of telegraph supplies in this country.

Electrician of the Company.

**BROOKS'**

PATENT PARAFFINE INSULATOR WORKS,

21 ASPEN STREET, NORTH OF 2123 CHESTNUT STREET,  
PHILADELPHIA.

The guarantees of this insulator are:

1st. A current resistance in rain or fog, or in rain and fog, combined of 100,000,000,000 Ohms.

2d. To insulate a conducting wire of any length in rain or fog or rain and fog combined, to its full working capacity, or the capacity of a similar wire or conductor placed upon any other insulators under the most favorable circumstances of weather.

3d. Strength, not to break or part by any strain by, or that a No. 8 wire will bear.

It is not injured by missiles in the general acceptance of the term.

It does not depreciate from exposure to smoke, soot and the gases from combustion to one hundredth part of the extent of ordinary insulators.

It is not injured by atmospheric discharges. It is a protection to the poles from the same effects, there not being an authenticated instance of a pole being injured where these insulators are used.

JOHN POLHEMUS, Printer and Stationer, 102 Nassau Street, N. Y.
